Hello Dave,

Looks like Garth, Harold and myself are coming from the Atlantic fleet so far.

I would like to see a talk on an anti-roll system for these boats.
I think you had looked into this with Damen for active stabilizing fins.
Other options are the hinged fins that many Fishing vessels have or active trim tabs.

All I know is something needs to be done. They want us to patrol through the nights whenever possible.
The crews are getting fatigued trying to achieve this in North Atlantic conditions in the winter.
Most 45 foot fishing boat we work around are wider than the MSPV's.

The other is the command center modification and gangway replacement. Sound like you have the first one on the agenda already.
The insulation around the transceivers sound like a good plan. I was on the Kaeble last summer and really like their layout.

No just looking at timelines if all works out for the end result of them getting stabilizers

1. Feasibility study – 5 months – to September 2017 –
2. Agreement on feasibility moving forward – 3 months – to December 2017
3. Engineering for Stabilizers – 5 months to May 2018
4. Agreement for Engineering – 3 months to September 2018
5. Spec and Drawings – 1 month to October 2018
6. Contracts and implementation - ????

Dave

Subject: Re: MSPV stabilizer study question

Are you talking about promising that stabilizers are coming in 2 years? We're going to do the feasibility study and I think it looks promising but there will be trade offs that Fleet will have to agree to (carry less fuel, vessels that go slower because of the appendages) so I don't know that you'd be in a position to promise stabilizers. Even if ITS recommended them, it will likely come to a fleet decision because of what we may have to compromise on operationally.

Subject: RE: MSPV stabilizer study question

Dave,

With the Captain Goddard's area of operation being the north coast of British Columbia we experience a wide range of different weather and swell conditions.

We are 100% in favor of any form of stabilisation. (I know our clients would be much happier)

As the engine room is quite cramped there is probably no chance of installing "Active stabilisers" but even bilge keels would be a great addition to the stability of the vessel.

Objet : MSPV stabilizer study question

Hi Captains,

HQ is starting to run studies into stabilizers for the MSPV's (info will be presented at the MSPV face to face). I have received concerns from Atlantic region with rolling, etc. Does the Great Lakes or Pacific have the same concerns? If there is no concern with Pacific or Great lakes then we can narrow the study down to waveforms in Atlantic only. Waveforms are different in each area.

Thank you
Dave

FYI

Talked to the rep today at Quantum, the QC1200 is the unit put on the rest of the Damen 4207's. Ballpark cost from him was [redacted] plus installation, [redacted]

I wonder if we could run the fins off our current Central Hydraulics? We need to shave a couple thousand pounds off to get this installed, less fuel is about the only option. Diesel outboards and remove the gas tanks.

Once I get some more information from Quantum I will finish the CCR and submit it to you Gabe.

How did the meeting go today? I know you were busy today but did you manage to get down to the boat shop to see if they had a spare ignition switch for our RHIB?

Talk to you tomorrow.

Hi Simon:

Good speaking with you, please see the attached RFI.

I have also included the spec sheets as discussed but keep in mind I still need to run the numbers on the power and size of the HPU.

Also I have attached a couple of data sheets for general info for N&V and potential for cavitation and how to reduce the chance of it.

If you have any questions, please let me know.

Sincerely,

Quantum Marine

TECHNICAL SPECIFICATION DOCUMENT

DANFOSS VLT MCD 500

ADVANCED DIGITAL ONE SPEED DRIVE SOLUTION

DESCRIPTION:

The DANFOSS MCD 500 provides the most advanced digital soft start solution for the complete range of Quantum hydraulic power units. The MCD 500 incorporates full motor protection features and has been designed for reliable performance in the most demanding installations.

FEATURES:

- **SIMPLE INSTALLATION:** The Quantum/DANFOSS MCD 500 units arrive mounted in IP55 enclosures. One enclosure size can house one or two soft starters, depending on installation type. No line reactor requirement further simplifies installation and also lowers installation cost.
- **INTEGRAL BYPASS CONTACTOR:** No harmonic distortion on the ship's buss.
- **FULLY PROGRAMMABLE:** Includes output signal simulation.
- **DISPLAY:** User friendly liquid crystal display.
- **APPEARANCE:** Delivered in the enclosure complete with cable glands and painted to customer specifications.
- **CERTIFICATIONS:** C√; UL/C-UL; CE; CCC; Marine-Lloyds No.1; RoHS

Equipment is covered by Quantum's 1 year comprehensive warranty.
Service and technical support are available worldwide.

Capacity	15 - 50 HP [11 - 37KW]
IP Rating	IP 55 [in enclosure]
Outputs	3x relay programmable Analog programmable
Voltage	200-525VAC 50-60Hz
Liquid Crystal Display	Loggings, real time graphs, SCR conduction bar graph
Protection	Wiring/Connection/Supply Current, Thermal, External, Starter
Dimensions* **	490 x 410 x 210 [H x W x D]
Weight**	17.8kg/22.8kg
Heat Rejection**	41watt/82watt

**Provided for reference only. Consult a Quantum representative for system sizing.*
*** Refers to one or two pump version.*
**** Dimensions are of the equipment, and do not include service allowances.*

QP20E

HYDRAULIC POWER UNIT

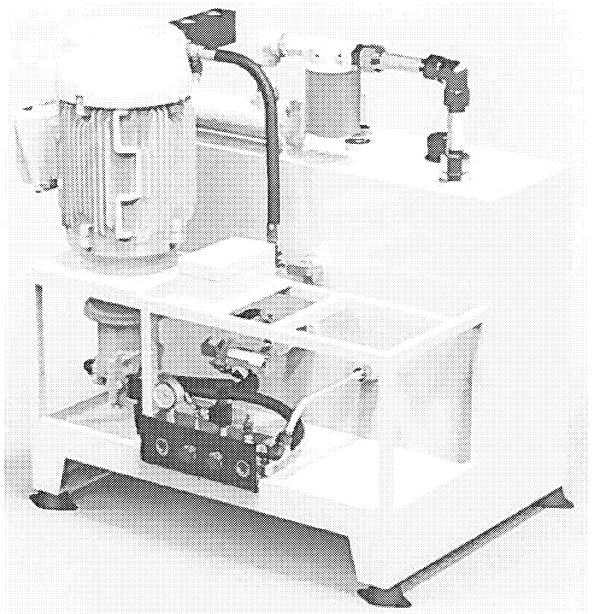
DESCRIPTION:

The QP20E hydraulic power unit provides the fluid power necessary to articulate the stabilizer fins. Quantum power units can be paired with a variety of stabilizer hull unit sizes and quantities based on vessel requirements providing for a multitude of arrangement options.

Designed to consolidate maximum machinery output into a small footprint, this compact and economical unit can be easily positioned into tight machinery spaces. The QP20E power unit consolidates on a single skid the hydraulic drive train on an a steel frame with drip tray, an oil reservoir with associated gauging and sensors, as well as return filtration and oil cooler. The QP20E is a proven heavy duty built machine which can be depended upon to supply hydraulic power for the most demanding stabilizer systems.

FEATURES:

- **SIMPLE INSTALLATION:** The QP20E is designed to incorporate maximum hydraulic function within a single "plug and play" assembly. Thus, straight-forward connections for mechanical installation, as well as hydraulic and cooling pipe work are at the heart of the QP20E design.
- **EFFICIENT:** The power unit only draws the minimum power necessary to operate the hydraulic components on demand, thus reducing the load on the vessel's electrical power and cooling systems.
- **MINIMAL NOISE:** Quantum's power units utilize a single isolation system to bring vibration levels down.
- **FUNCTIONALITY:** The durable paint finish, polished stainless steel tubing and military grade black anodized manifolds make this unit a practical marine-grade solution. Easy access to all components also translates into timesaving maintenance.



Operating Capacity*	15kW (20hp)
Operating Pressure	172bar (2500psi)
Tank Capacity	201L (53Gal)
Length *(overall)***	1206mm (47.5")
Height *(overall)***	1150mm (45.3")
Depth *(overall)***	873mm (35.4")
Weight *(dry)*	454kg (1000lbs)

**Provided for reference only. Consult a Quantum representative for system sizing.*

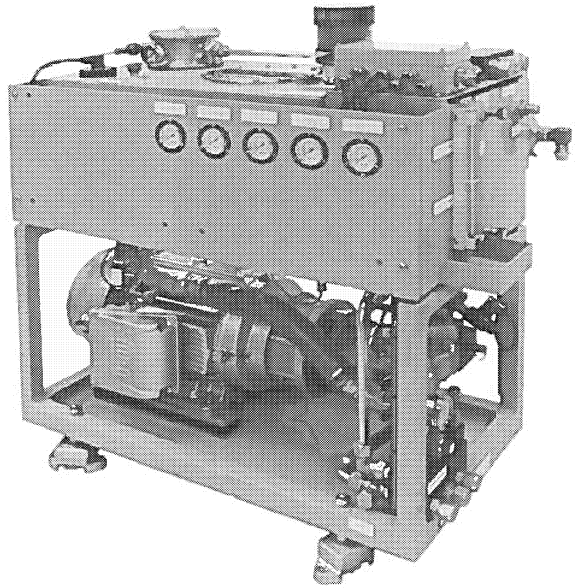
MPU20

MILITARY HYDRAULIC POWER UNIT



DESCRIPTION:

The military hydraulic power unit provides the fluid power necessary to articulate the stabilizer fins. Quantum power units can be paired with a variety of stabilizer hull unit sizes and quantities based on vessel requirements providing a multitude of arrangement options.

Designed to consolidate maximum machinery output into a small footprint, this compact unit can be easily positioned into tight machinery spaces. The MPU20 power unit consolidates on a single skid the hydraulic drive train on an aluminum frame with drip tray, stainless steel oil reservoir with associated gauging and sensors, as well as return filtration and oil cooler. The MPU20 is a proven heavy duty built machine which can be depended upon to supply hydraulic power for the most demanding stabilizer systems.

FEATURES:

- **SIMPLE INSTALLATION:** The MPU20 is designed to incorporate maximum hydraulic function within a single "plug and play" assembly. Thus, straight-forward connections for mechanical installation, as well as hydraulic and cooling pipe work are at the heart of the MPU20 design.
- **EFFICIENT:** The power unit only draws the minimum power necessary to operate the hydraulic components on demand, thus reducing the load on the vessel's electrical power and cooling systems.
- **MINIMAL NOISE:** Quantum's power units utilize a three-point isolation system to bring both noise and vibration levels down. Hydraulic noise suppressors are attached directly at pump discharge to minimize hydraulic noise in the pipes.
- **FUNCTIONALITY:** The durable paint finish, polished stainless steel tubing and black anodized manifolds make this unit a work of art as well as a practical marine-grade solution. A desiccant breather and thermo-couplings ensure the system operates optimally in any condition to stabilize your mission .

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2.1.2 Longitudinal Location

The stabilizers are to be placed within the middle third of the vessel length, taken from the forward start of the design waterline (DWL) to the propeller(s).

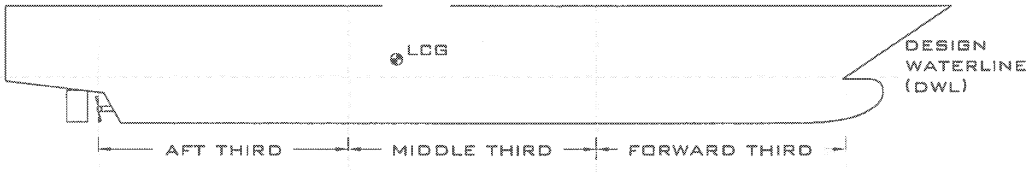

Figure 7: Longitudinal Fin Location

Stabilizers placed within the forward third are prone to slamming loads, which may cause damage to the stabilizer equipment. In addition, stabilizers in the forward third may be located in the vicinity of the bow wave, which will significantly alter incoming flow to the fin and may significantly reduce the effective depth of the fin in the water.

Stabilizers placed within the aft third are prone to cause a yawing effect, which may influence vessel steering, especially in seas aft of the beam. In addition, stabilizers positioned in the aft third are very likely to influence the flow of water into the propeller, which may affect propeller efficiency and ultimately vessel speed.

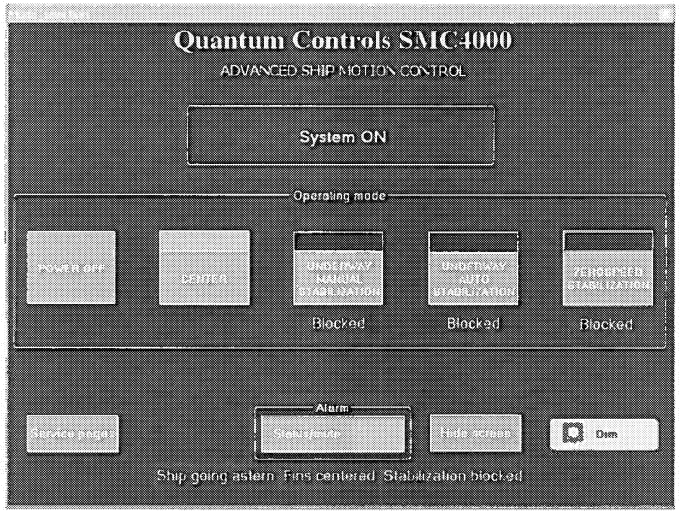
Stabilizer fins that are to be active during underway operations are to be located at or forward of the Longitudinal Center of Gravity (LCG).

Figure 8: Longitudinal Center of Gravity

Stabilizer influences on the steering of the vessel are apparent when the fins are aft of the LCG and are amplified with distance aft of the LCG. Please note: For some four-fin stabilizer systems, it may be necessary only to run the forward stabilizer pair underway. In these cases, the aft pair may be located aft of the LCG, but may not be run underway unless the possible steering effects are understood and can be tolerated.

SMC4000

ADAPTIVE STABILIZER CONTROL



DESCRIPTION:

The stabilizer control is the brain behind the stabilizer system. Collecting vessel roll motion data and instantaneous performance feedback, the stabilizer control system combines the necessary parameters to quickly comprehend vessel roll motions and to then instigate an immediate response. The control logic is capable of accounting for and compensating to various operating conditions. The control is capable of collecting ship's speed data via a NMEA 0183 interface to control maximum fin angle for high speed use. Adaptive logic tailors the ride making the SMC4000 perfect for underway and Zero Speed™ stabilization.

FEATURES:

- **DUAL-MODE OPERATION:** The SMC4000 features an Automatic Mode, which accounts for vessel motions and adjusts the system response, without the need for continual manual adjustments. The control also offers full manual control for those situations in which manual input can result in improved performance.
- **EASY-TO-UNDERSTAND OPERATION:** The SMC4000 control head, which is to be mounted on the bridge for easy access, features an LED display of stabilizer activity, easy to use controls, and a dimmable display for nighttime navigation. System alarms can be displayed on the SMC4000 control head, or can be integrated with the ship's central alarm monitoring system.
- **SIMPLE INSTALLATION:** The control system is comprised of a minimal quantity of components, which are quickly and easily bolted into place.
- **SAFETY PRECAUTIONS:** To avoid damage to the stabilizer system, the SMC4000 ensures that the stabilizer fin is automatically brought to the center position when Neutral or Astern operations are employed. The "Center" function can also be employed by the captain with the push of a button.

Required Power Supply	24V DC
Length (control head)*	188mm (7.4")
Width (control head)*	257mm (10.1")
Depth (control head, excluding cables)*	50mm (2.0")

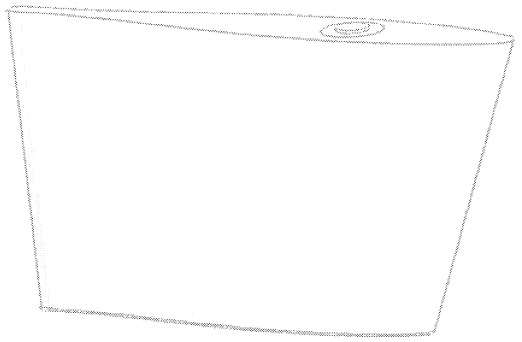
QC1200

UNDERWAY (S-SERIES) STABILIZER FIN



DESCRIPTION:

A stabilizer fin is the device which develops the hydrodynamic forces needed to counter the roll motions of the vessel. The fin is installed on the stabilizer hull unit shaft, which serves as the axis about which the fin is deflected. Much like an airplane wing, as the fin is deflected, pressure differences result in a hydrodynamic force on the fin. This resultant force is used to counter-act the roll of the vessel.

Designed based on extensive experience and model testing, the QC1200 S-series stabilizer fin is capable of significantly reducing vessel roll during underway operations.

FEATURES:

- **SIMPLE INSTALLATION:** The fin is installed on the stabilizer hull unit shaft via a hydraulic coupling method. This attachment technique provides a durable and reliable connection, easily achieved with the use of supplied tools and instructions.
- **MINIMAL NOISE:** Quantum's stabilizer fins are designed with innovative features such as minimal hull-to-fin clearances and trailing edge vortex generators. These elements help to reduce hydrodynamic noise and vibrations.
- **ROBUST CONSTRUCTION:** The fins are fabricated of steel or stainless steel combined with strategic internal reinforcement. This interior bolstering enables the fin to withstand the cyclic loads encountered during operation.
- **MINIMAL MAINTENANCE:** The fin requires no maintenance during normal operation. The units are designed for maintenance intervals corresponding to vessel haul-outs every other year.

Typical Vessel Length*	30-45m (100-150ft)
Fin Size Range**	1.4-2.7m² (15.0-29.0ft²)
Typical Aspect Ratios	0.53-0.64
Typical Balance	25%
Dimensions	See a Quantum Representative for Drawings

**Provided for reference only. Consult a Quantum representative for system sizing.*
*** Size may be limited for higher speed vessels; see a Quantum representative for more information.*

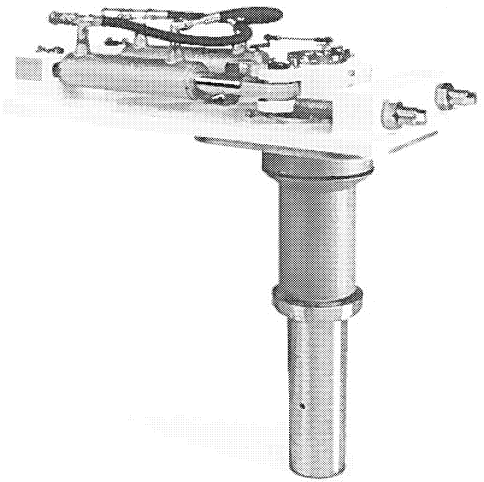
TECHNICAL SPECIFICATION DOCUMENT

QC1200

STABILIZER HULL UNIT



DESCRIPTION:

A stabilizer hull unit is the energy transfer device in Quantum's fin stabilizer systems. The hull unit is installed in the turn of the bilge with its main shaft penetrating through the vessel's hull to connect to the stabilizer fin. It uses hydraulic cylinders to rotate the main shaft, which in turn, deflects the fin to reduce roll.

Designed using the latest technology and high-quality materials, the QC1200 is a rugged machine that is capable of significantly reducing vessel roll during both underway and Zero Speed™ operations. The QC1200 can be made available with built-in porting and electronics to allow this unit to be used with Quantum's innovative extendable (XT™) fin system, or as a Heavy Duty (HD) unit with larger load bearing components.

FEATURES:

- **SIMPLE INSTALLATION:** The hull unit is delivered fully assembled for easy installation into the vessel's structure, via the supplied welding bushing.
- **PRECISE FITS AND CLEARANCES:** The main shaft features a tapered cut for true stabilizer fin connection, and a rotating-spline connection to the tiller and hydraulic cylinders. These precise fits promote a smooth transfer of energy from the hydraulic cylinders to the stabilizer fin.
- **SAFETY PRECAUTIONS:** Heavy-duty bolts are used to manually return the fin to its center position in the event of an emergency.
- **LOAD HANDLING:** A series of sleeve bearings and a spherical roller bearing distribute the motions and loads imposed on the hull unit.
- **MINIMAL MAINTENANCE:** The hull unit is simple to maintain during normal operation, with stainless steel components used extensively to minimize corrosion. Easily accessible grease nipples are built-in with internal porting for regular greasing of the bearings. The unit is designed for replacement of o-rings, seals, and bearings during vessel haul-outs every other year.

Equipment is covered by Quantum's 1 year comprehensive warranty.
Service and technical support are available worldwide.

Typical Vessel Length*	30-45m (100-150ft)
Fin Size Range**	1.4-2.5m² (15-27ft²)
XT™ Fin Size(s) Available**	1.2x1.6m² (13x17ft²)
Length *(including centering bolts)****	1145mm (45")
Width***	440mm (17")
Height *(overall)****	970mm (38")
Height *(inside vessel after installation)****	630mm (25")
Weight *(dry)****	290kg (640 lbs)

**Provided for reference only. Consult a Quantum representative for system sizing.*
*** Size may be limited for higher speed vessels; see a Quantum representative for more information.*

Guideline for Reducing Cavitation at the Fin Stabilizers

Purpose

This document is intended to relay detailed information to the designer and builder on proven methods to minimize cavitation noise due to the gap between the top of the stabilizer fin and the hull plating.

The Art of Cavitation Reduction

The presence of cavitation on fin stabilizers is a reality and cannot be avoided for all applications or in all operational states. It is however desirable and possible to reduce this cavitation to a level at which it does not cause irritation. There are many ship design aspects that influence stabilizer fin cavitation. These include but are not limited to:

- the longitudinal location of the fin on the hull
- the gap between the hull plating and the fin
- the boundary layer
- fin immersion depth
- fin aspect ratio
- vessel speed (VERY CRITICAL for higher speed applications*)
- installation techniques
- other hull appendages

These variables make every application entirely unique. It is possible to perform both mathematical and scale model testing to anticipate the onset of cavitation, but these methods are costly and are not always reliable. This guideline is offered to help abate cavitation related issues based upon Quantum's accumulated experience.

*The likelihood of cavitation increases with vessel speed. For vessels operating in excess of 20 knots, it is Quantum's recommendation that the fin-to-hull gap meets the minimum tolerance provided in the "Allowable Fin-to-Hull Gap" table. (*See Mitigation Steps: After Vessel Construction* for more information)

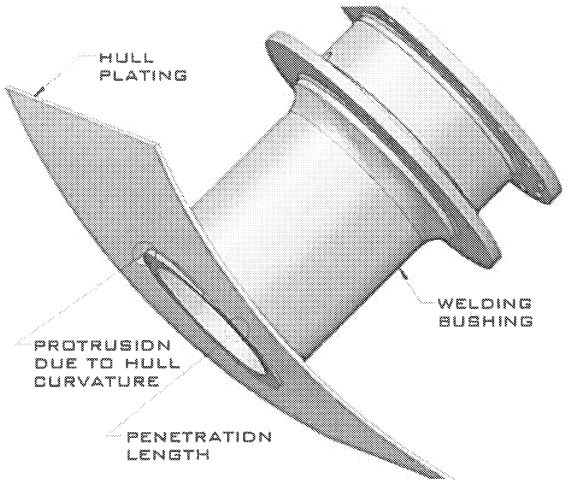
Mitigation Steps: During Vessel Design

During the vessel's design phase the fin size and location on the hull are determined. The designer and builder must check the location of the fins in relation to other underwater hull appendages such as hull penetrations, sea-chest scoops, and bilge keels. The designer should ensure that the installation details of the welding bushing include steps that will minimize the chance of cavitation at the fin. These details are described below.

Mitigation Steps: During Hull Construction

The distance that the welding bushing protrudes through the hull plating and its angle to the hull has a direct relationship on the fin-to-hull gap. Although this initial installation requires careful precision, it is one of the easiest implementable steps towards cavitation reduction.

Flush mounting the bottom surface of the welding bushing to the hull bottom with a back bevel weld is highly recommended over an exterior fillet weld. This allows the welding bushing to be drawn into the hull resulting in a surface that is as flush as possible. Purely for the purposes of structural integrity the welding bushing may protrude slightly, however the protrusion should not exceed 10mm. It should be noted that a



All information contained within this document remains the property of the Quantum Group. Any use of the information other than for the intended purpose is expressly forbidden.
All transactions are subject to Quantum's standard Terms & Conditions.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

protrusion of the welding bushing through the shell plate increases the fin to hull gap and therefore increases potential for cavitation.

The welding bushing must be installed normal to the local hull surface in all directions. A slight error in the angular orientation could result in either the aft end of the fin colliding with the hull, or resulting in a very large gap between the fin and the hull. It may be helpful to make and use an alignment tool or jig for this installation.

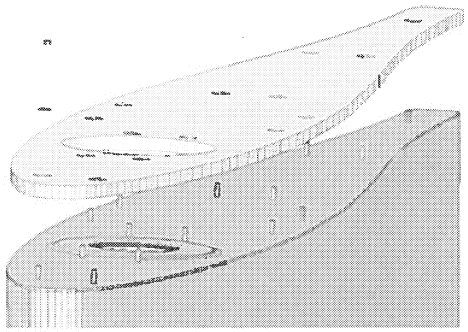
Mitigation Steps: After Vessel Construction

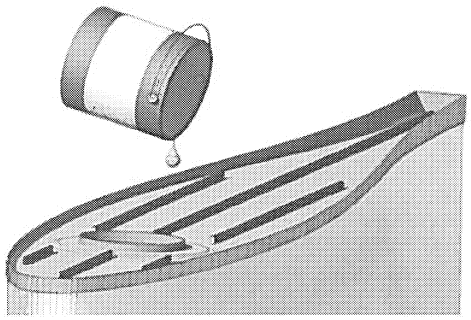
It is possible to reduce the gap after the installation is complete by adding material to the top of the fin. It is prudent to perform this task as a preventative measure to avoid cavitation. There are two notable techniques to accomplish this task. Be mindful when choosing materials as some may swell under water which would close up the gap further and may cause chafing or prevent the fin from moving completely. Keep in mind that some gap is required to accommodate increasing paint thickness over the years, marine life growth and most importantly shaft deflection due to hydrodynamic forces. The allowable gap shown in the table at right is to be maintained along the entire chord length of the fin in its center position.

Allowable Fin-to-Hull Gap		
Hull Unit	Min. [mm]	Max. [mm]
QC1000	8	18
QC1200		
QC1500		23
QC1800	10	
QC2200 QC2400 QC2600	12	25
QC3600	14	35

Quantum permits any of these modifications to the fin listed below as long as they do not compromise the integrity of the fin. However, Quantum cannot be held liable for damages to the equipment or hull caused by any modifications or consequences resulting from the modifications.

1. A full length shim can be shaped and attached to the top of the fin. To precisely attain the optimal shim thickness, it is best to first install the fin and physically measure the gap. It is recommended to use a bonding adhesive under the shim. Quantum can, upon request, supply a fin with threaded inserts to facilitate mounting a shim. If not supplied by Quantum, shipyard can weld threaded studs to the fin and counterbore the shim holes to keep the nuts from protruding.





2. An epoxy filler can be poured onto the top of the fin. One method is to install the fin and tack weld strips of metal to the side of the fin to create a temporary fence to hold the epoxy until it hardens. This method is easier to create a varying thickness of build up for a more uniform gap thickness. The green represents the removable border, while the blue represents permanent welded strips to increase fin bonding surface area for the epoxy.

Unless agreed upon in the terms and conditions for sale, Quantum is not responsible for the reduction of the fin-to-hull gap.

NOISE AND VIBRATION REDUCTION FOR HYDRAULIC PIPES AT BULKHEAD AND DECK PENETRATIONS

Insufficient vibration isolation of hydraulic pipes at bulkhead and deck penetrations can cause significant structure-borne noise and vibration. Pressure pulsations in the hydraulic fluid traveling through pipes - due to piston motion and valving, as well as mechanical vibrations originating in hydraulic pumps - can create structureborne vibration in bulkheads and decks, resulting in radiation of airborne noise from these large panel structures. To ensure that the vessel safety requirements are met without compromising noise and vibration control performance, special attention must be paid to bulkhead and deck penetrations.

The best solution to reduce the transfer of vibration from hydraulic pipes to bulkheads and decks consists of two components:

1. A soft attachment (or no attachment) to the bulkhead or deck, at
2. A relatively rigid point in the bulkhead or deck, achieved by
   - Existing stiffeners or additional stiffeners,
   - Proximity to intersections of structural members,
   - Increased plate thickness at the penetration location.

There are many types of commercially available soft attachments for bulkhead and deck penetrations, for different applications. The basic options are described below (all systems should be installed according to manufacturer instructions):

I. Fire-Rated and Watertight Rated

a) Softest

The softest hydraulic pipe penetration system, in J&A's experience, is the RISE system, from CSD Sealing Systems. The RISE system, shown right in Figure 1, consists of fire-resisting rubber sleeves that wrap the hydraulic pipes. Gaps in the deck or bulkhead penetration are then filled with additional rubber sleeves and the penetration is closed with a highly-elastic watertight sealant. In case of a fire, the rubber sleeves will expand up to five times their original volume and provide a tight seal against smoke and fire.

During installation, care should be taken that the additional sleeves are not packed too tightly as this could reduce the effectiveness of the vibration isolation they provide. Good alignment should be maintained such that the pipes are centered in the penetration.

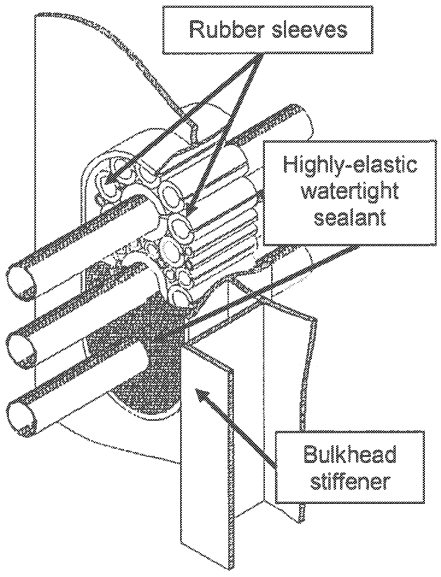

Figure 1: RISE System for Fire-Rated and Watertight Penetrations

All information contained within this document remains the absolute property of J&A Enterprises. Any use of the information for other than the intended purpose is expressly forbidden.

www.jandaenterprises.com

16 Broadway.
Salem, MA 01970
phone (978)-741-1551
fax (978) 741-4447

b) Semi-soft

Transit systems such as the Nelson Transit System, the Hawke Transit System, and the Roxtec sealing system, all provide fire and watertight rated, semi-soft attachment for pipes. These systems consist of a frame in which several pipes can be isolated in individual modules, as shown in Figure 2. The kit is then tightened and the modules compressed so that all gaps around pipes are eliminated.

c) Hard

Hard rubber plug systems, such as CSD Slipseal plugs, are available that meet fire and watertight ratings. These systems typically provide less vibration isolation than the soft and semi-soft systems described above.

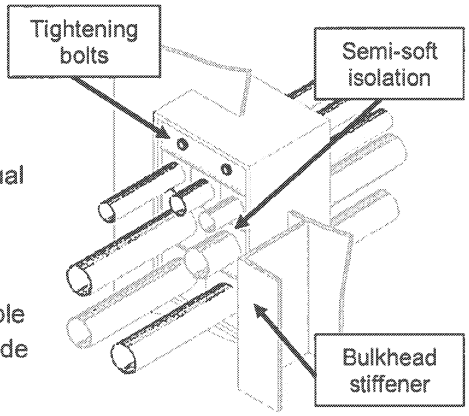

Figure 2: Transit System for Fire-Rated and Watertight Penetrations

II. Water-Resistant Penetrations

Several good options exist for vibration isolation of hydraulic pipes in water-resistant bulkheads and decks. One method is a vibration isolator around the pipe, such as soft rubber or Sylomer foam, in combination with a highly flexible watertight sealant. If Sylomer is used, 12mm (1/2") of Sylomer R (blue) is recommended. Compression of the Sylomer R-12 strip should not exceed 2.5mm. It is also important that the pipe is centered in the penetration before inserting Sylomer. This concept is shown in Figure 3.

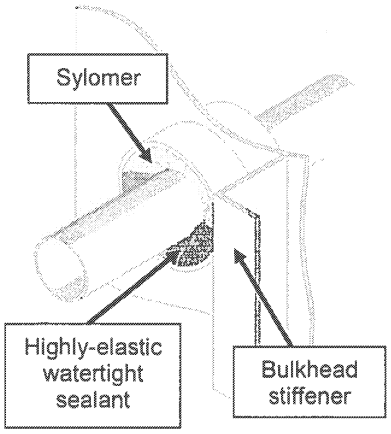

Figure 3: Sylomer Foam and Sealant for Water-Resistant Penetrations

Another option for pipe vibration isolation in water-resistant bulkheads and decks is a system such as the Flexicraft PipeSeal; see Figure 4. This system consists of rubber sections that are tightened to expand and fill gaps around the pipe. RISE and Roxtec (previously mentioned) also provide water-resistant bulkhead isolation systems.

All systems should be installed according to manufacturer instructions.

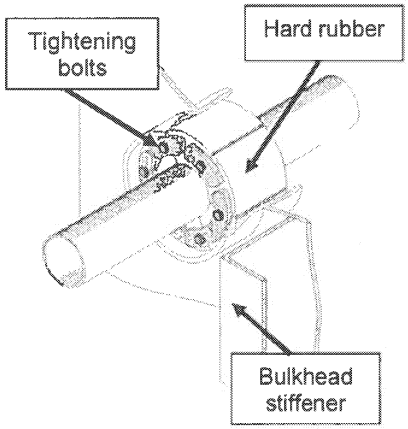

Figure 4: Flexicraft PipeSeal System

III. Non-Fire-Rated, Non-Watertight Penetrations

The best method for isolating hydraulic pipe vibration from non-fire-rated, non-watertight penetrations is to pass the pipes through the penetration without contact. Pipes can be supported on isolated pipe clamps on separate points of rigid vessel structure on either side of the penetration. See the J&A paper "Noise and Vibration Reduction of Hydraulic Pipes and Accessories" for guidelines on the isolation mounting of pipes.

Are you talking about promising that stabilizers are coming in 2 years? We're going to do the feasibility study and I think it looks promising but there will be trade offs that Fleet will have to agree to (carry less fuel, vessels that go slower because of the appendages) so I don't know that you'd be in a position to promise stabilizers. Even if ITS recommended them, it will likely come to a fleet decision because of what we may have to compromise on operationally.

Dave,

With the Captain Goddard's area of operation being the north coast of British Columbia we experience a wide range of different weather and swell conditions.

We are 100% in favor of any form of stabilisation. (I know our clients would be much happier)

As the engine room is quite cramped there is probably no chance of installing "Active stabilisers" but even bilge keels would be a great addition to the stability of the vessel.

Producing the CCR PDF Form (Points to look at)

- **2- Category:** Consider whether said changes should receive a wider application (such as class-wide, regionally and/or nationally) where additional benefits might be realized, before receiving RCCB approval. In such cases the scope for the CCR should be Major, rather than minor.
- **3- Work Description:** Break the work description into the following sub titles: Existing Condition, Solution, Benefits, maintenance cost, (Give more details of work using: Word, Excel, pictures, etc., attached documents to your email.)

Once you have completed **sections 1 to 5** of the most recent version of the pdf CCR Form, scan the form and sen ensure that the form is profiled into EKME. The RCCRC is then required to circulate the form secretarially or to ad Regional CCRC email addresses below.

Once the CCR has been signed by the Regional Authorities (section 6), the RCCRC is responsible to ensure that th inform the originator via email, with the NCCRC cc'd, of the request status. The NCCRC will then update the CCR

If you have any questions or suggestions regarding the CCR Form or Process, don't hesitate to email me at : NationalCCRCoordinator@DFO-MPO.GC.CA

Subject: Stabilizers on Hero Class vessels

Good Morning all,

I just wanted to give an update on the stabilizer request for Hero Class. CCR 3103 is up for approval by the director board shortly. I have made another request to the RCMP and C&P head office points of contact for information on any lost program time due to lack of stabilizers and vessel rolling. If you have any of this information then send it along as I know this will help the case to install stabilizers. I have had a response from Great Lakes only stating that no program time has been lost due to lack of stabilizers and vessel rolling. Nothing from QC, Atlantic or Western.

Team Nav Arc has hired Damen to do a study to see if the stabilizers can be implemented on our vessels. I expect this study to be done at the end of this month. Engineering will have to be done after this and approved by the board of directors.

I have attached what the stabilizer unit installed on the Dutch Coast Guard vessel that I visited in June looks like from the inside.

Dave, good morning from the west coast.

I have asked our client for any information regarding lost time etc as per your request.
I have copied an email thread below.

There are no hard facts to days lost or hours lost but as you scroll down you eventually come back to one of your emails.

Subject: RE: Hero Class vessel stabilizers

Hi Robert can you give this a read over and see if it makes sence? I added your comments and Myas.

Hi Linda

I have canvassed the C&P crew on the Martin Charles and they have provided the following feedback on vessel stabilizers.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

It goes without saying that the crew is in favour of having stabilizers installed on the ship. Having less pitch and roll is always a good thing when at sea. Walking around the ship, climbing stairs, launching and retrieving the RHIB, storing gear, having meals and even sleeping is safer, less tiring and physically more comfortable, especially for those that succumb to motion sickness.

Seasickness is felt by both C&P and Coast Guard personnel and has an impact on vessel operation, as those employees are not operational while seasickness persists. Many officers/ crew who are not typically effected by motion sickness when they are moving about and doing physical day to day work when at sea, but when having to focus on a computer screen or other "paper work" the effects of the motion will cause some people to get sick. C&P officers tend to do their admin work during the periods when the vessel is transiting. So the more we can reduce officer down time due to the effects of motion, the more productive the officers will be getting the admin done during these periods of transiting, therefore increasing their time on the water when arriving at the next port of call.

The crew are in favor of having vessel stabilizers that function while at anchor as well as when underway. The ship at times anchors in areas at sea subject to ocean swell, I have experienced this myself and can state first hand that it makes for a sleepless night and makes it harder to do your admin work during the day.

As well while transiting at night from Sound to Sound in the exposed waters of the West Coast of Vancouver Island can make for a very uncomfortable night . On the trip I did in July we transited up the coast overnight and had to put rolled up jackets under the outer edge of my bunk to keep me rolled to the wall so I would not come out of my bunk in the night give the amount of roll in the ship . Although the stabilizers would not completely eliminate this issue it would certainly lessen the effect.

When officers get motion sickness , most use a medication either prophylactically or in response to the symptoms. The main ingredient in motion sickness oral medication is Dimenhydrinate, which is an antihistamine used to prevent and treat nausea, vomiting, and dizziness caused by motion sickness. Drowsiness and blurred vision, are common side effects of taking these medications adding to the problems associated with the constant motion of the vessel. Officers manage this and ensure they do not put themselves in danger , but if we could mitigate the need for taking medication we mitigate the probability of risk associated to the side effects of the medication .

Currently when the M Charles transits in exposed waters the skipper will set a weather course to keep the ship from really rocking around. This course is based on the swell and wind direction and is used to alleviate excessive ship motion and not based on the shortest distance to the destination. This prolongs the ships exposure to the swell albeit in a mitigative fashion, therefore exposing the ships crew to motion and therefore motion sickness. As well the ship tends to travel further distances on the weather course therefore burning more fuel and putting more engine hours on the vessel and increasing operation costs.

Dave,

Since you have had no response from Quebec, I did a partial survey on my ship. (I had no idea this was asked). These were the responses:

Replacement Captain: No real opinion [redacted]

Second nav officer: There have been two days this year where wind conditions have prevented the ship from moving (A team) read: non-operational.

And below is what the team leader for the RCMP sent his boss which I think is being sent to you.

Regards,

Sheldon

Salut Hector,

J'ai regardé dans les fichiers de patrouilles des dernières années et j'ai noté approximativement 5 fois par saison où nous demeurons à quai à cause du mauvais temps. Ceci exclut aussi les jours de navigation que nous avons manqués pour profiter d'une fenêtre météo pour se rendre à destination. Je pense qu'il faut aussi prendre en considération que souvent nous prenons le large avec le KAEBLE en sachant que le trajet ne sera pas agréable. [redacted] Un autre point à considérer est celui de la mise à l'eau des Zodiacs lorsque la mer est agitée. Avec plus de stabilité du navire, celle-ci nous permettrait de larguer et de récupérer les Zodiacs beaucoup plus sécuritairement. [redacted] Une plus grande stabilité du navire serait appréciée par tout l'équipage et éviterait le mal de mer à répétition.

Pierre

Subject: RE: Hero Class vessel stabilizers

Good morning all,
I just wanted to touch base to see if there has been any updates on the following request? I have heard from the Great Lakes so far that there is no documented program time lost due to lack of stabilization. I understand the G. Peddle has just experienced some rough seas while they were on program. The CCR will be going in front of the board approvers shortly.
Any information on program time lost due to sea sickness, inability to launch the RHIB or inability to board vessels due to the vessel rolling in rough seas would be helpful.
Thanks
Dave

Good Morning all,
I have created a configuration change request (CCR 3103) to request engineering and implementation of stabilizers on the Hero Class vessels. This is a high priority for the CCG MSPV working group and vessels. But unfortunately since it is a big investment (I estimate around [redacted] CCG management will be looking for a good business case.
As discussed at the Partners User group workshop in Montreal, can the C&P and RCMP partners give me any documentation on program impact by not having stabilizers which would keep the vessel from rolling? Keep in mind there are different stabilizers, some stabilize the vessel only while underway and others might be able to stabilize while the vessel is idle and underway.
Any information on program time lost due to sea sickness, inability to launch the RHIB or inability to board vessels due to the vessel rolling in rough seas would be helpful.
Thank you
Dave

Hi Dave,

I'm not sure if you have made regional contact with C&P in Dartmouth.

I know they keep a record of all their ship time, i.e. Time on patrol, boardings, anchor, weather bound in port, anchor, transit.

If you haven't heard from them I can try and contact Michael Grace here to see if we can get that data.

[redacted]

I [redacted] can email and phone to assist with this if necessary.

Subject: Rép. : Hero Class vessel stabilizers

Good morning David, first I want to apologies for the delay in responding to your e-mail request. It is very good news to see that measures are being taken to improve the stability of those MSET Vessel. I have had the opportunity to patrol in the gulf of St. Lawrence and the rolling effect is very problematic.

With regard to your request regarding program lost. I have discussed with our officers that spend all their times on the ship and here is some of the comments that I received. Looking at the patrol files for the past few years, it shows that approximately 5 times per season where we are docked because of bad weather. This does not include navigation days that we had to stand down due to weather in order to get a window to travel to our next port. Because of the stability issues and rolling effects of the ship, often the crew knows in advance that the voyage they will undertake won't be pleasant, this create undue stress on everyone. Another point to consider is the launching of the Zodiacs when the sea is agitated. With more stability of the ship, it would allow us to launch and retrieve the Zodiacs much more safely. Greater stability of the ship would be appreciated by the entire crew and would avoid repeated seasickness.

Submitted for your information and follow up.

Yours truly,

Good Morning all,
I have created a configuration change request (CCR 3103) to request engineering and implementation of stabilizers on the Hero Class vessels. This is a high priority for the CCG MSPV working group and vessels. But unfortunately since it is a big investment (I estimate around [redacted] CCG management will be looking for a good business case.
As discussed at the Partners User group workshop in Montreal, can the C&P and RCMP partners give me any documentation on program impact by not having stabilizers which would keep the vessel from rolling? Keep in mind there are different stabilizers, some stabilize the vessel only while underway and others might be able to stabilize while the vessel is idle and underway.
Any information on program time lost due to sea sickness, inability to launch the RHIB or inability to board vessels due to the vessel rolling in rough seas would be helpful.
Thank you
Dave

Subject: MSPV User Group Workshop Action Items
Good morning,
Attached is the list of action items developed following the national CCG/RCMP/C&P MSPV user-group workshop held on March 9, 2017 in Montreal.
Please let me know if you have any questions or concerns,
Marc

Bonjour,
La liste des mesures de suivi ci-jointe a été élaboré suite à l'atelier national du groupe d'utilisateurs des PSH du 9 mars 2017 à Montréal.
S.V.P. laissez-moi savoir si vous avez des questions ou des préoccupations,
Marc

Subject: FW: Stabilizers on Hero Class vessels

Good Morning Dave,

I'm not sure if all this helps or if its just too much information.
To sum it all up we lost 44.5% 112 of 252 days of allotted ship time in 2016/17 to weather.
In 2016/2017 87 days of those weather days were in seas less than 3m, which is inside the TSOR operational envelope.
In the previous year they lost 133 days to weather of which 107 days of that was under 3m seas.

You can see the report below I was given by Michael Grace who is in charge of the OSO branch in Dartmouth which is just one of our DFO clients, but this is the branch that we have the most weather related problems with due to the area of operations being the East Coast and not in the Gulf of St. Lawrence or other sheltered waters like the Labrador Coast.

Also I will reiterate Mr. Grace in that the 2016/17 report is still draft as it has not been approved by Ottawa.

I hope this helps. If I can get anything else for you please do not hesitate to ask.

Regards,

Greg

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Greg extracts from C&P reports on Program delivery in relation to SLA. The 2015-16 report has been shared with CCG. The 2016-17 report still requires my Director's approval and CCG needs to be consulted prior to finalization. As well, it is understood that sea state and wind do not always have a direct relationship – table 1 is meant to document typical conditions. Weather conditions we either direct observations as recorded in ships log and/or marine Forecasts recorded by FO's where a PV was in port. I hope this information is helpful and please do not hesitate to contact me if I can be of further assistance.

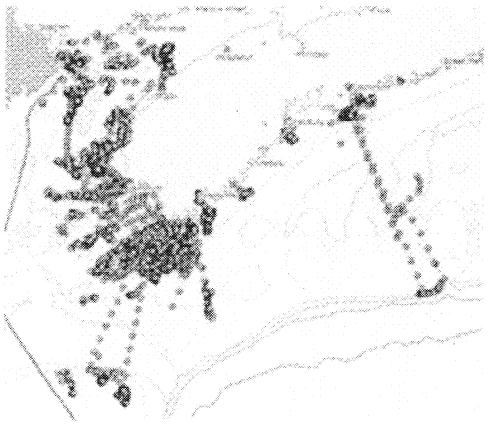
FYI – I have cc'ed Christena Lalonde as she is the staff officer at NHQ for large platforms and is C&P;s CCG contact in respect of large platforms.

2015-16 report – sharhed with CCG

Table 1: Anchored/ In Port Days and reported wind speeds /Sea state conditions (total 133.7 Days)

	≤ 20 knots		20 to 30 knots		30 to 35 knots		> 35 knots	
	Days	%	Days	%	Days	%	Days	%
	60.3	45	47.16	35.3	11.9	9	14.3	10.7
Sea State	.5 to 2 m		2 to 3 meters		3 meters		3+ meters	

Graphic 1: VMS depicting December 2, 2015 fishing activity



Several examples exist where the MSPV was "all fast" in port (e.g. Shelburne) as per Captain's direction due to weather while significant on water activity is taking place offshore. The graphic to the left, taken from Vessel Monitoring System Data (VMS) depicts fishing vessel activity from 0600 to 2359 on December 2, 2015 – 0600.

The Marine Weather forecast was: Winds Southerly 15 kts increasing to Southeast 20-25 kts in morning, veering to Southwest 20-25 kts. in afternoon, diminishing to Southwest 15 kts in evening, increasing to Southwest 25 kts overnight with 1 -2 meters seas. Unfortunately the MSPV was limited in ability to operate during the resulting conditions at sea.

Subject: Fwd: Stabilizers on Hero Class vessels

Good Morning Mike,

I am wondering if you would be able to assist me with some data for the proposal to install stabilization systems on the MSPV's.

I was contacted by Dave Wyse our national project manager for the vessels and he was unable to get any information from Atlantic region.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

I know that the Fishery Officer's normally record all their program time, whether they are working or delayed. I do not know if that break down is kept on file and if you have a total amount of ship time booked versus received and how much of that ship time was actually used for work and how much we lost to weather or other issues.

If you keep this data on file would it be possible to have access to it, or be provided with some statistics that we can provide Ottawa. The more important one would be the amount of program time compared to the number of ships days you received.

As we do not really record this on the vessels as weather delays do not make a big difference on our end, any data you or your Fishery Officers could supply would be greatly appreciated. It will go towards helping the case to get a stabilization system installed on the vessels to hopefully decrease lost program time and make the vessels more useful to your department, our client.

I [redacted] can be reached via email or my cell at [redacted]

> I just wanted to give an update on the stabilizer request for Hero Class. CCR 3103 is up for approval by the director board shortly. I have made another request to the RCMP and C&P head office points of contact for information on any lost program time due to lack of stabilizers and vessel rolling. If you have any of this information then send it along as I know this will help the case to install stabilizers. I have had a response from Great Lakes only stating that no program time has been lost due to lack of stabilizers and vessel rolling. Nothing from QC, Atlantic or Western.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Team Nav Arc has hired Damen to do a study to see if the stabilizers can be implemented on our vessels. I expect this study to be done at the end of this month. Engineering will have to be done after this and approved by the board of directors.

I have attached what the stabilizer unit installed on the Dutch Coast Guard vessel that I visited in June looks like from the inside.

Bonjour Dave,

C'est très difficile d'estimer le nombre de jours d'opérations perdus à cause des conditions de mer. Nous étudions les prévisions à court et moyen terme et adaptons notre programme et nos transits en conséquence. Depuis deux étés que je suis à bord, je suis peut-être resté « caché » 5 jours, mais probablement que nous ne serions pas sortis même avec des stabilisateurs !
Cela dit, je suis tout de même très en faveur de la pose de stabilisateurs. J'ai navigué un été sur le Frederick G Creed et ses stabilisateurs sont extrêmement efficaces (bien que ce soit un type de navire complètement différent). Ce serait une grande amélioration pour la sécurité du personnel, sans compter la qualité de vie.

Merci et bonne fin de semaine !

Subject: RE: MSPV Stabilizers

Gary,

Concerning stabilizers, the status of the work we are doing is the follows:

We have a contract in place with Damen to do a seakeeping analysis of the MSPV with various types of stabilizer systems. Damen did the original seakeeping analysis that was delivered with the vessels and we want to make sure we have the same baseline for comparison purposes. Entry into this contract was delayed due to issues working through the system with DFO Contracting and then, once we had the contract in place, the OPI went on vacation. But they are actively working on it now. I have asked Damen for an update as to when we can expect to see a report.

The next step, we plan a contract to have a company physically look at the vessel for the feasibility of installing a system, particularly an active stabilization system. And active system will require internal space to accommodate the hydraulic and mechanical systems.

One system that's been put forward to us as a preferred option by the operators is a Zero Speed system that is reported to work while the vessel is stopped – we note that this system appears likely to add about 1.2 tonnes to the vessel. Any active system is likely to have a similar weight impact.

Aside from the internal space required for the associated equipment, and the envelopes needed for maintenance and possible encroachment on other systems / spaces and any potential impacts that may be determined, there is the issue of the additional weight. These vessels have a load line restriction that limits future weight growth, and 1+ tonnes for a single engineering change will have a major impact on that.

Marine Engineering did an assessment to determine if there was the potential to relax the load line restriction and it was found that damage stability compliance was the limiting criteria. Marine Engineering proposed to Operations that the through life growth margin could be changed from 4 tonnes to 10.5 tonnes – but this would mean that the vessel would not comply with the Passenger Vessel standard for Damage Stability. In the worst condition, the margin line would be submerged at the transom – although water would not be on the deck. It was shown that the vessel would still comply with other international standards for damage stability – but not the Passenger Vessel standard.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Although it was tabled that there is no regulatory requirement for the MSPV to comply with any damage stability standard, this was an Owner's requirement for this project.

The results of the discussions with Operations last year were that they (Ops) were not willing to relax the requirement to meet the Damage Stability standard for Passenger Vessels and no change to the load line was authorized.

It appears that an approval for an active stabilization system for the MSPVs will require something to give.

With the analysis that we're doing, we aim to provide all of the benefits that the various types of stabilizers will bring to this class of vessels (including better seakeeping for operations and overall safety) so that they can be considered along with the costs (not just monetary, but space, weight, reduction of damage stability capacity).

Hopefully this gives a sufficient overview of the work we are doing.

Subject: MSPV Question FW: Stabilizers Contract

All,

I am providing some information on the MSPVs to Vladan with regard to the stabilizers. Please advise if I have misspoken.

Could you please also let me know what power supply there is on board (frequency and voltage).

There is 600V, 230V, and 115V power distribution @ 60Hz
Correct. Most probably, the stabilizers should be wired to 600V, 3ph, 60Hz

Also a question from them if zero-speed stabilising can be done using the main engines for power (as opposed to using the generator).

Not quite clear on the question. The main engines are not fitted with alternators so they would not be able to provide electrical power. They do provide hydraulic power via PTO driven hydraulic pumps.
Agree, the question is not clear. Might be also somehow related to automatic retraction at zero-speed. From what I know, these stabilizers should automatically retract back in ship's hull when ship's speed drops to a certain value. Assumption is made that ship is approaching a dock and this is a precaution to prevent the damage to stabilizing fins in case of human error (operator can forget to retract them).

Subject: RE: Stabilizers Contract

s.19(1)

Hi Vladan,

[redacted] I will finish the input next week. Here an update :

I want to mention the following points:
I took the quantum normal Stabilizers equal to those that are already installed on other 4207's.
Quantum gave preliminary numbers for the Pseries and is working on a more detailed fin. However they called me yesterday and said they need to make sure the vessels do not qualify as military. Can you confirm that your 4207s are not, based on the second page of the pdf I included (ITAR section).
Could you please also let me know what power supply there is on board (frequency and voltage).
Also a question from them if zero-speed stabilising can be done using the main engines for power (as opposed to using the generator). This is more stuff [redacted] will look into, but it may have a small influence on the capability of the fin. The answer shouldn't influence the fin much for this calculation.

Regarding the deck wetness, I advise to use the top of the bulwark instead of deck level, despite the holes in the bulwark. These holes will allow the deck to get wet, but the deck will be wet anyway due to spray in those conditions. The far more undesirable green water events will take place when the bulwark is submerged in a wave.

There are no other 4207s with bilge keels as far as I know, so I designed a bilge keel according to our standard practices.

[redacted]

Best regards, [redacted]

Hi Vladan,

[redacted]

I spent a day at MARIN this week to create the model for the zero speed Stabilizers. I finished that, so it is now ready to run.

I also spent an hour there working on the wave spreading tool, but we still did not get it to work. I also don't quite agree with the method they propose, but time was limited so we will continue next week.

Hopefully I will have all the parameters next week, which I then want to discuss with you prior to running the analyses to check if you agree with the designs.

Enjoy the weekend.

Best regards, [redacted]

Dave,

We got two questions from Damen related to electric power supply and main engine power supply on MSPV's. They are highlighted in the e-mail below. You got this already from John. We got answer on the first one, and would appreciate if you can get more info on the second one.

You can respond to Tracey, or directly to [redacted] Damen.

s.19(1)

Thanks.

Vladan.

Subject: RE: Stabilizers Contract

Hi Vladan,

[redacted] I will finish the input next week. Here an update :

I want to mention the following points:
I took the quantum normal Stabilizers equal to those that are already installed on other 4207's.
Quantum gave preliminary numbers for the Pseries and is working on a more detailed fin. However they called me yesterday and said they need to make sure the vessels do not qualify as military. Can you confirm that your 4207s are not, based on the second page of the pdf I included (ITAR section).
Could you please also let me know what power supply there is on board (frequency and voltage).
Also a question from them if zero-speed stabilising can be done using the main engines for power (as opposed to using the generator). This is more stuff [redacted] will look into, but it may have a small influence on the capability of the fin. The answer shouldn't influence the fin much for this calculation.

Regarding the deck wetness, I advise to use the top of the bulwark instead of deck level, despite the holes in the bulwark. These holes will allow the deck to get wet, but the deck will be wet anyway due to spray in those conditions. The far more undesirable green water events will take place when the bulwark is submerged in a wave.

Configuration Change Request (CCR)

Email DATA | Email PDF | Print

1. Identification

CCR Number	2017-3103	Originator	David Wyse	☎	9932710	Date	2017-07-27
		Contact		☎		Region	NCR
		Contact		☎			

CCR Title	Hero Class stabilizers	AMS W.O.#:	
Equipment		ABS #:	15E
System	Auxiliary Systems	Asset Title:	
Drawings and/or specification affected			

Type of work	☑ HME	☐ E & I	☐ MCI	☐ S / ER

2. Category

Priority		Description
Normal	☑	The proposed configuration change is justified, but not urgent or high priority.
High	☐	A solution to an operational or technical problem must be determined and implemented within three months.
Urgent	☐	Affects safety or the ability to conduct operations and must be implemented immediately.

Scope:	☐ Minor	☐ Major	☑ Major National	Description: Form, Fit Function

3. Proposed Configuration Change (Add attachment as required to explain the situation in detail)

EXISTING CONDITIONS: Item affected. Identify contracts, systems, subsystems and when possible, contract and items or components affected by change.

The parent Hero Class design vessels are delivered with stabilizers. The Hero Class vessels do not have stabilizers installed. All vessel operators agree the Hero Class vessels require stabilizers in all areas of operation. Program and operations can suffer do the fact that the vessels have extreme roll in high sea state conditions.

RECOMMENDED SOLUTION: Describe hardware or software modification, and / or recommended study to correct the problem or to capitalize on an improvement opportunity. Rough sketches or diagrams may be attached to amplify this description. Enter rough cost estimate for the project.

Phase 1 - Engineering and feasibility study

Phase 2 - implementation after approval of phase 1

ANTICIPATED BENEFITS : How change will improve systems, e.g. reliability, reduced weight, decreased cost, substantially improved performance.

Vessels will be more stable for program and operations in high sea state conditions.

IMPACT ON MAINTENANCE BUDGET :	Yes ☐	No ☐	IMPACT ON OPERATIONAL BUDGET:	Yes ☐	No ☐

Impact of not implementing change e.g. safety hazard, mission failure, high maintenance costs, schedule slippage. Explain relative desirability of each alternative way to meet need for change.

Without stabilizers there is an increased hazard of crew injuries and program failures.

PRELIMINARY Estimated Cost by Fiscal Year			Total Estimated Cost
FY:	FY + 1	FY + 2	(attach sheet with details)

Total Cost includes : Purchase, fabrication, installation, training, updated drawings and publications, etc.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Configuration Change Request (CCR)

Email DATA | Email PDF | Print

4. CCR Impact Assessment Checklist

Step 1		If impact applies, select (☑) for each item selected, attach file containing supporting details or AMS W.O. number related.
Step 2		To close CCR , (See Section 10) Verify that the action required to address impact was completed and attach the file containing supporting details or AMS W.O. # related.
#	1	Will Change have an impact on: (Give a brief description in an attached file.)
1	☒	Safety, health, habitability and human factors.
2	☒	Operational capacity, performance, and/or reliability.
3	☐	Compliance with laws/regulations and security requirements.
4	☒	Ship Stability, changes requirements - weight added and removed (Refer to standard operating procedure). TBD
5	☐	Other similar systems or interfaces with other systems.
6	☐	Real property.
7	☐	Environment.
8	☐	Other configuration changes that have been proposed or approved.
9	☒	Electrical power requirement; Electromagnetic compatibility; Equipment removal routes; HVAC and cooling.
10	☐	Existing inspections, tests and/or trials.
11	☐	IT Security: Seek Regional or National IT Security Coordinator advice where change could potentially compromise IT security. Arrange for action required (e.g. Risk Assessment, supporting documentation, etc) to maintain IT system security.
12	☒	Operations and Maintenance costs.
13	☐	Software.
14	☒	Procurement : Procure as necessary: Modification kits; Spares, repair parts and consumables; Special tools; Test equipment; and Diagnostic software.
15	☐	Existing inventory : Locate and modify all affected spares held in inventory.
16	☐	Disposal : Locate and purge all equipment and parts that are no longer required.
17	☒	Technical Data : Revise the affected drawing indices, drawings and parts lists. Affected Drawing(s) #:
18	☒	Amend the operating manuals and maintenance manuals affected by the modification.
19	☒	Update the maintenance requirements to be consistent with the revised configuration.
20	☒	Training : Update the training of personnel to reflect the modified equipment, including the revision of training
21	☐	Facilities : Modify / renovate facilities as necessary, including installation requirements such as space, power, air conditioning, lighting, etc.
22	☐	AMS: Update the asset structure in the Asset Management System, identifying new maintenance items.
23	☐	CM File: Place all documents pertaining to modification approval in the modification documentation file and retain for reference.
24	☐

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1 Introduction

The Canadian Coast Guard has nine vessels in the Hero Class, which are the Damen SPa 4207 type, patrolling the Great Lakes and coasts of Canada. Although these vessels were not built by Damen – they were built by Irving Shipbuilding in Canada – Damen did make the design and the speed and seakeeping analyses (1). These vessels have no special roll stabilizers installed and the vessels consequently show high roll response. The department of Fisheries and Oceans Canada has requested Damen, as designer of the SPa 4207, to analyse five specific roll stabilization methods in seven configurations (2). These methods include both roll stabilizers that act at speed and stabalizers that also act at zero speed.

The goal of the analysis is to compare these seven configurations to each other and the ships as they are now. Additionally, the effect on top speed and range is investigated.

For this analysis the 2D strip theory program Qship (v.2.0.1) was used, developed by MARIN. Qship is a pre- and post-processor that combines several other tools. The 2D strip tool is Shipmo, the operability tool WASCO and the used post-processor tools are RAOviewer (v.2.14.4) and OperabilityViewer (v.1.11.1).

The report starts with a summary of general particulars in chapter two, followed by a chapter describing the environmental conditions. The fourth chapter describes the seven roll damping configurations and their design parameters. In the fifth chapter the influence of these methods on speed and range is calculated. The sixth chapter gives more details on the seakeeping modelling and parameters. All the result plots are given in the seventh chapter. The eighth and final chapter contains a general discussion and conclusions.

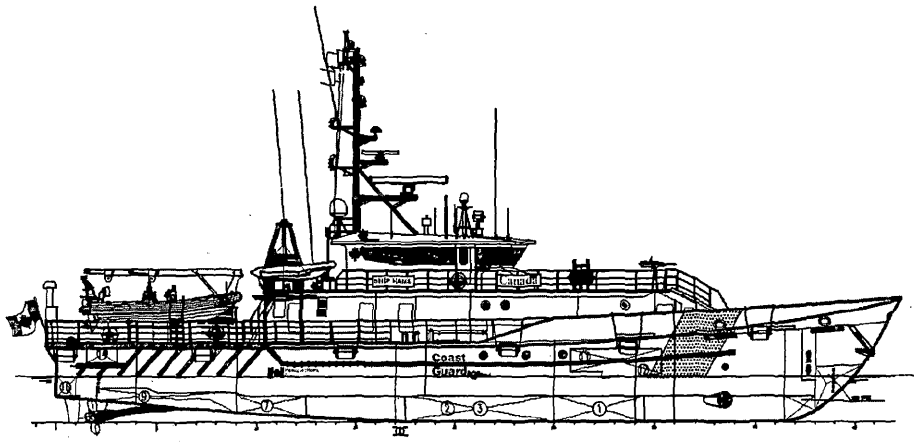
2.2 Principal dimensions and loading conditions

Overall length	:	42.8	[m]
Length w.l.	:	40.0	[m]
Breadth waterline	:	7.0	[m]
Draught aft / fwd	:	2.27 / 2.15	[m]
Displacement	:	264.0	[t]
GM	:	1.00	[m]
LCG	:	16.70	[m]
VCG	:	2.91	[m]
TCG	:	0.00	[m]
k_{xx}	:	2.69	[m]
K_{yy}	:	10.20	[m]
K_{zz}	:	10.20	[m]

N.B. Values as used in calculation in Qship. Values may differ slightly from stability booklet, due to small inaccuracies in the lines plan which was used in Qship.

2.3 *Outline*



Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2.4 Axis definitions

The axes of the coordinate system are:

X-axis: Longitudinal axis. Positive towards bow. Zero at aft perpendicular.

Y-axis: Transverse axis. Positive towards port side. Zero at centre line.

Z-axis: Vertical axis. Positive upwards. Zero at baseline.

2.5 Locations

The seakeeping analysis is performed for the following locations:

#	Description	X [m]	Y [m]	Z [m]
1	Bridge	20.92	0.93	7.20
2	RHIB launching station	5.00	3.50	3.90
3	Deck at 0.9L	38.50	1.75	5.72
4	Forefoot	38.50	0.00	0.00
5	Centre of gravity	16.70	0.00	2.91

Note that location number 3, the deck at 0.9 L, is used for green water occurrence estimation. Therefore the height is set to the top of the bulwark, rather than deck level.

2.6 Operational speeds

The vessel's cruising speed is 14 knots.

The maximum speed is 25 knots.

The seakeeping analysis is performed for 0 to 25 knots in 5 knot steps.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

3 Environmental conditions

The Hero Class patrols both the Great Lakes and the North Atlantic and North Pacific. The Great Lakes have a limited fetch and the seas are not fully developed. They are therefore best described by a JONSWAP spectrum. The North Atlantic and North Pacific are oceans where fully developed seas are more common. These oceans are both modelled as 2-parameter Pierson-Moskowitz (also called Bretschneider) wave spectra.

For both locations (Great Lakes and North Atlantic/Pacific) sea states 5 and 6 are analysed. In Table 2 the definitions of sea states are listed, as found in (3). The mean significant wave height and most probable peak period are selected. To combine the North Atlantic and North Pacific, the average of the peak periods is chosen. For the Great Lakes the most probable peak periods are assumed to be equal to those of the North Sea (4), by lack of data. Note that the North Sea / Great Lakes have much shorter waves (lower peak periods) than the more developed North Atlantic/Pacific. A summary of the analysed sea states is presented in Table 1.

Table 1. Sea states used in the analysis.

	Great Lakes		**North Atlantic/Pacific**	
	JONSWAP		Pierson-Moskowitz	
	Hs [m]	Tp [s]	Hs [m]	Tp [s]
Sea state 5	3.25	7.0	3.25	9.7
Sea state 6	5.0	9.0	5.0	13.1

In all the calculations the following definitions and assumptions have been used:

- The definition of heading with respect to waves is consistent with the direction in which the waves travel with respect to the vessel; 0° waves are stern waves, 90° is beam waves from starboard and 180° wave heading is sailing in head waves.
- Deep water has been assumed.
- The wave spectra are unidirectional or long-crested, i.e. no wave spreading was applied.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 2. Sea state definitions. Source: (3).

Open Ocean Annual Sea State Occurrences from Bales (1983) for the North Atlantic and the North Pacific							
Sea State Number (–)	Significant Wave Height $H_{1/3}$ (m)		Sustained Wind Speed 1) (kn)		Probability of Sea State (%)	Modal Wave Period T_p (s)

4 Roll stabilization methods

This chapter describes the selected roll stabilizing methods and their main parameters.

4.1 None – current situation

The Hero Class in its current form has no roll stabilizers. The only roll damping appendages that are taken into account are the skegs and rudders. The skeg parameters are listed below, according to Figure A and Table 3. The rudders are defined according to Table 4. Two skegs and two rudders are fitted, around either propeller.

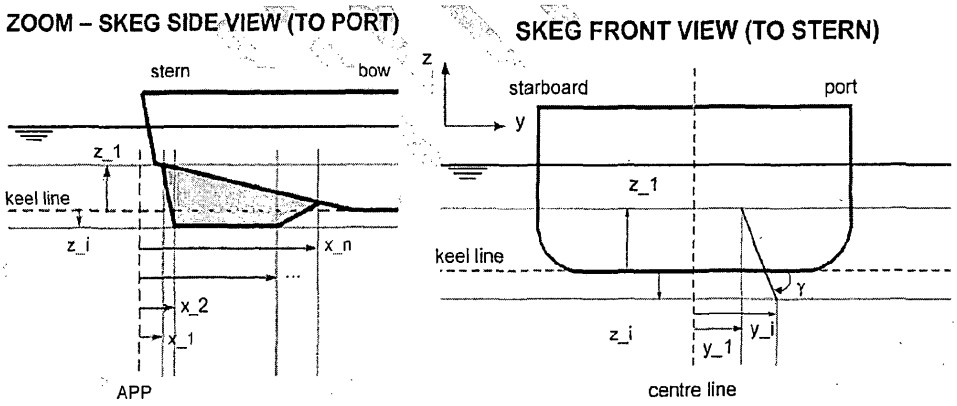

Figure A. Skeg parameter definitions.

Table 3. Skeg parameters

Parameter	Value	Unit
X_n	3.00 2.64 6.26	[m]
Y_n	±1.50 ±1.50 ±1.50	[m]
Z_n	1.20 0.60 1.00	[m]
Depression angle	90	[deg]

Table 4. Rudder parameters.

Parameter	Value	Unit
Root X	1.00	[m]
Root Y	±1.50	[m]
Root Z	1.30	[m]
Span	1.30	[m]
Chord	0.65	[m]
Depression angle	90	[deg]

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.2 Active stabilizer fin

The first roll stabilizer method is to use active stabilizer fins. These are wing profiles attached to the sides of the vessel and actively rotated to control the angle of attack. The Quantum Underway S-series active stabilizer, model QC-1200, was selected as appropriate fin. It is fitted on several other SPa 4207s. Two fins are fitted, one on either side of the vessel. The main parameters are listed in Table 5.

Table 5. S-QC1200 parameters.

Parameter	Value	Unit
Root X	18.00	[m]
Root Y	±2.50	[m]
Root Z	1.14	[m]
Span	0.86	[m]
Chord	1.45	[m]
Area	1.25	[m^2]
Depression angle	64	[deg]

4.3 Active zero-speed stabilizer fin

The second roll stabilizer method is to use active zero-speed stabilizer fins. These are wing profiles attached to the sides of the vessel and actively rotated to control the angle of attack. The difference with regular active stabilizer fins is that these are also effective at zero speed, when there is no flow velocity along the fin. The stabilization at zero speed is obtained by a combination of drag and inertial forces that occur when rotating the fin around its axis. To achieve maximum effect, the fin has a long chord and a shaft placed close to one edge. The fin also works like a regular stabilizer fin, though it needs a larger fin area due to the less favourable aspect ratio.

The Quantum ZeroSpeed & Underway P-series active stabilizer, model QC-1500, was selected as appropriate fin. Two fins are fitted, one on either side of the vessel. The main parameters are listed in Table 5. For reference, an example of a different, slightly larger, P-series fin is shown in Figure B.

Table 6. P-QC1500 parameters.

Parameter	Value	Unit
Root X	18.00	[m]
Root Y	±2.50	[m]
Root Z	1.14	[m]
Span	1.04	[m]
Chord	2.89	[m]
Area	3.00	[m^2]
Depression angle	64	[deg]

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

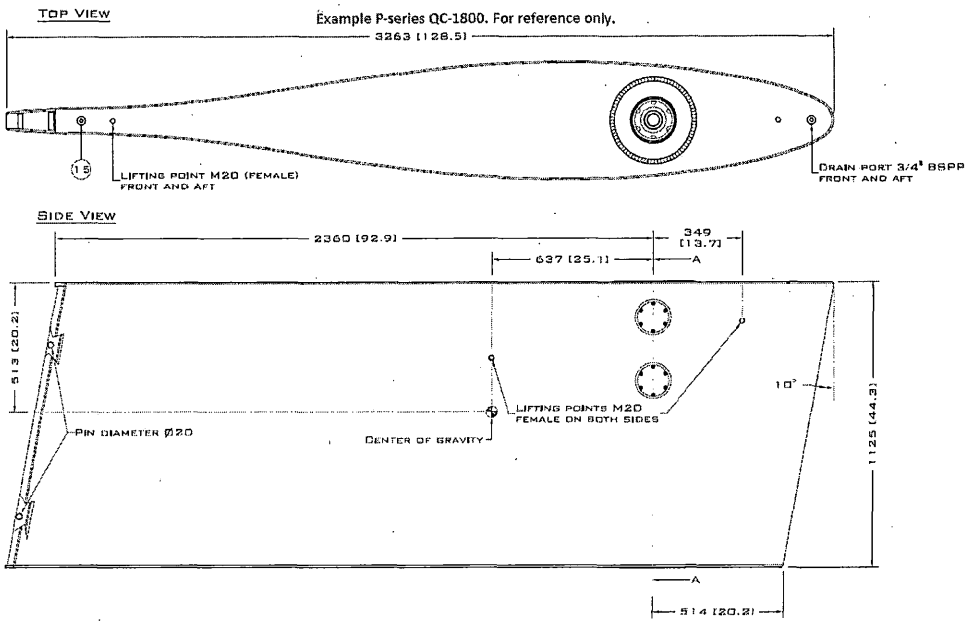

Figure B. Example of Quantum P-series fin, model QC1800 (not used in this analysis).

4.4 Bilge keels

The third roll stabilizer method is the application of bilge keels to the vessel. Bilge keels are long flat plates that run along a certain part of the length of the vessel, preferably at maximum distance from the roll axis (longitudinal through the centre of gravity) and as perpendicular to the flow in roll as possible.

Several design considerations are to be taken into account:

- The bilge keel should not interfere with the wake field. Starting the bilge keel at 1/3 L from the stern is usually a safe distance.
- The bilge keel should not extend forward too much, to avoid coupling with pitch. It also loses its effectiveness when it is placed closer to the roll axis, as happens closer to the bow. Generally the bilge keels are stopped at 2/3 L from the stern.
- The bilge keel should not extend below the bottom and out of the sides, to avoid them being vulnerable to collision of grounding damage.
- The height of the bilge keel is important for its effectiveness. However, at some point adding more height will only marginally increase effectiveness in roll damping, while still increasing resistance in forward direction. A common practice is to choose a large HP-profile.
- The bilge keel should be placed along the streamlines of the vessel, to

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

minimize forward resistance.

The parameters of the chosen bilge keel design is listed in Table 7, the definitions in Figure C.

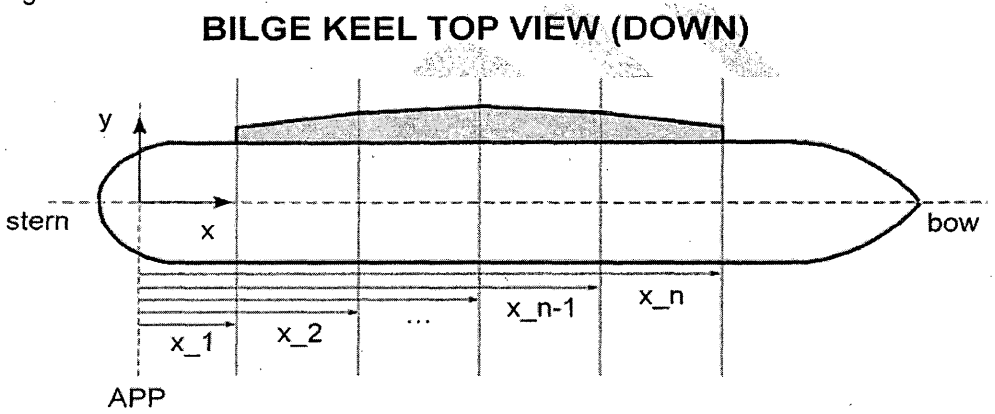

Figure C. Bilge keel parameter definitions.

Table 7. Bilge keel parameters.

Parameter	Value	Unit
X_n	13.9 18.7 23.0 28.0	[m]
Y_n	±2.75 ±2.67 ±2.58 ±2.12	[m]
Z_n	1.29 1.26 1.34 1.6	[m]
Depression angle	64	[deg]

4.5 Active rudder (existing rudder controls)

The fourth roll stabilizing method is active rudder roll damping. This uses the existing rudder and steering pumps installation but controls it to use the roll moment induced by rudder action to act as damping on roll motions. The inertia of the vessel in yaw (change of heading) is much larger than that in roll, making it possible to dampen roll without inducing large yawing motions. Since this method uses the existing rudders, the parameters are equal to those listed in Table 4. The appeal of this method is the absence of extra weight and hardware. N.B. The existing steering pumps may not be suitable for the intense use this method requires!

4.6 Active rudder (existing rudder controls) & bilge keels

The fifth method is a combination of the existing active rudders and bilge keels.

4.7 Active rudder (new rudder controls)

The sixth method is active rudder roll damping, using new rudder controls and steering pumps for a better performance.

4.8 Active rudder (existing rudder controls) & bilge keels

The seventh method is a combination of the new active rudders and bilge keels.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

5 Effect on speed and range

This chapter describes the effect of the presence of each of the roll damping methods described in the previous chapter on both maximum speed and range of vessel. For the calculations the assumption is that the active roll stabilizers (both fin types and rudders) are passive. Active systems will consume both hydraulic power and cause an increase in resistance due to changing angles of attack and drag coefficients, but these are highly dependent on the sea states, roll motions and speed of the vessel.
For all calculations a displacement of 250 tons is assumed, the displacement corresponding to 50% consumables. Some of the rudder stabilization method will add to the total weight of the vessel, thereby increasing the resistance and decreasing the maximum speed further. This is not taken into account in the following calculations, but rather a speed reduction in knots per ton gain in displacement is given at the end.

The reduction of the maximum speed is presented in knots, where the maximum speed itself is calculated at 24.9 knots for this displacement. An effect on maximum speed of e.g. -0.3 knots will therefore reduce the maximum speed to 24.6 knots.

For all range calculations the vessel is assumed to sail at cruising speed, i.e. 14 knots. The total fuel oil capacity is 31.3 m^3, or 31300 litre, leading to a range without any extra appendages of 2300 nautical miles.

5.1 Active stabilizer fin S-QC1200

The stabilizer fins are taken into account by adding the appendage drag to the vessel resistance. The appendage drag consists of two components:

- Friction. This depends on Reynolds number, velocity and wetted area.
- Pressure drag. This depends on frontal area, velocity and drag coefficient.

Effect on	Value	Unit
Maximum speed	-0.3	[kn]
Range at cruising speed	-68	[nm]

5.2 Active zero-speed stabilizer fin P-QC1500

The zero-speed stabilizer fins are taken into account by adding the appendage drag to the vessel resistance. The appendage drag consists of two components:

- Friction. This depends on Reynolds number, velocity and wetted area.
- Pressure drag. This depends on frontal area, velocity and drag coefficient.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Effect on	Value	Unit
Maximum speed	-0.6	[kn]
Range at cruising speed	-114	[nm]

5.3 Bilge keels

The bilge keels are taken into account by adding the appendage drag to the vessel resistance. The appendage drag consists of one component:

- Friction. This depends on Reynolds number, velocity and wetted area. The length of the bilge keel is increased by a factor of 1.25 to account for the fact that it will never be perfectly aligned with the flow. This is a very rough correction.

Effect on	Value	Unit
Maximum speed	-0.5	[kn]
Range at cruising speed	-113	[nm]

5.4 Active rudder (existing and new rudder controls)

The active rudder uses the normal rudder and when in passive roll damping mode does not add anything to the resistance.

5.5 Active rudder (existing and new rudder controls) & bilge keels

The combination of active rudders and bilge keels is equal to the results of applying only bilge keels, since the rudders are already installed and assumed passive in roll damping.

Effect on	Value	Unit
Maximum speed	-0.5	[kn]
Range at cruising speed	-113	[nm]

5.6 Effect of 1 ton increased displacement

An indication of the effect on both maximum speed and range of added displacement is given below for an increase of 1 ton, i.e. a displacement of 265 ton.

Effect on	Value	Unit
Maximum speed	-0.07	[kn]
Range at cruising speed	-5.6	[nm]

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

6 Seakeeping simulation parameters

Some of the more specialized seakeeping settings and parameters are described in this chapter.

6.1 Linearizing roll

Of all six motions a ship undergoes in seas, roll is almost always the largest. The roll stiffness of a regular hull is low compared to pitch and heave and the roll damping can be particularly low. Since the vessels natural roll period is often close to or even at the peak period of the wave spectrum it sails in, the roll motion is almost in resonance and damping dominates the roll amplitude. Since the roll damping is low, roll motions are often large.

The problem with modelling roll damping in linear theory, is that roll damping is very non-linear. That means that roll damping increases nonlinearly with roll angle (or rather, with roll velocity). This makes traditional approaches such as Response Amplitude Operators (RAOs) difficult, as an RAO is defined as a linear response per meter regular wave height. When the regular wave height increases from 1 meter to 2 meters, an RAO will predict an exact doubling of the roll angle. In reality, the roll angle will be less than double for the 2 meter wave.

To solve this issue, it is common to linearize the roll damping at several roll angles and then iterate to find the proper response. For every roll linearization angle a separate roll RAO is made.

It is therefore not meaningful to look only at 1 RAO and better to look at several. Best is to look at RMS values of the roll response in irregular seas.

That is why in this report, the values are often presented in terms of RMS. The RMS is defined as

$$RMS = \sqrt{M_0}$$

M_0 is the zero order spectral moment of the response or the variance. The spectral moment is defined as

$$M_n = \int_0^\infty S(\omega) \cdot \omega_e^n \cdot d\omega$$

In which $S(\omega)$ is the spectral density function of an arbitrary motion.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

6.2 Bare hull roll damping

The roll damping for the bare hull is modelled by so called PQ values. These describe the roll damping over a range of roll amplitudes and speeds and are obtained from model tests of the Spa 4207. The PQ values used are:

V [kn]	0	5	10	15	20	25
P	0.25	0.40	0.60	0.80	0.91	1.01
Q	0.030	0.029	0.027	0.026	0.024	0.023

6.3 Appendage damping gain parameters

The damping capacity of the active fins and rudders is influenced by the damping gain of the control system, which determines the active angle of attack on the fin as function of roll angular velocity and thereby the lift force on the fin. The choice of this gain is partly dependent on the roll angles of the vessels, but must be entered as 1 value for all sea states. These gains are determined in an iterative process, which ensures the fins' angles will stay between realistic limits. It was chosen to determine the damping gains for in between sea states 5 and 6 in the Great Lakes area, which yield the highest roll response. By setting these gains for these conditions, the roll damping will be somewhat overestimated in the other sea states in North Atlantic/Pacific.

When choosing these roll damping gains, the important boundary parameters are the maximum fin angle and maximum fin angular velocity.

The damping gain for both S-series and P-series was set at:

$$8\frac{deg}{deg/s}$$

The active rudder works in the same way. Although the maximum rudder angles are actually the same as the maximum fin angles, i.e. 35 deg, the maximum rudder angular velocity is much lower. From sea trial data of the Hero Class, the maximum rudder velocity with both existing steering pumps is estimated around 5 deg/s. The damping gain parameter is therefore also much lower than that of the fins. The damping gain for the active rudders with existing controls was set at:

$$0.8\frac{deg}{deg/s}$$

The damping gain of the active rudders, using new steering pumps capable of a recommended 15 deg/s rudder rates (5), was set at:

$$2.0\frac{deg}{deg/s}$$

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Although the damping gains of the active rudders are a lot lower than those for stabilizer fins, the much higher aspect ratio of the rudders results in a higher lift coefficient which ensures a decent roll damping performance.

6.4 Zero speed fin

The Quantum zero-speed stabilizers at zero speed are modelled by adding a damping, which is different for every linearized roll angle.

The zero speed fin is modelled by first principles of drag and inertial forces when rolling while the fin kicks from one extreme fin angle to the other extreme. The amount of work that is done by one cycle of the fin is then translated into an equivalent damping that acts during the entire roll motion of the vessel. Since the total work done in roll by the fin remains constant for every roll angle, the damping is calculated for specific roll angles and then used to interpolate between these.

6.5 Bilge keels

The bilge keels are modelled with IKEDA roll damping methods.

6.6 MSI

The Motion Sickness Index (MSI) according McCauley and O'Hanlon has been calculated for several locations. This index is an indication of the amount of people that get seasick in a population that is not accustomed to ship motions. Since the Hero Class crew are all highly accustomed sailors, the absolute numbers of the MSI results are not significant, but relative comparison is still valid.

6.7 Slamming

The slamming probability is calculated on the basis of the relative motion and relative velocity response at the specified location. The slamming probability is defined as the probability of emergence times the probability of exceedance of a specified relative velocity, as these parameters are assumed to be uncorrelated. The relative velocity is defined by Ochi's criterion (Ochi, 1964: Prediction of occurrence and severity of ship slamming at sea). Probability of exceedance is based on the local draught.

6.8 Deck wetness

The deck wetness is modelled in a similar way as slamming, where the relative motion threshold is equal to the local freeboard and there is no relative velocity threshold.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

7 Results

All seakeeping results are presented in this chapter. These include RAO plots of roll and polar plots of roll and other variables.

7.1 RAOs

The roll RAO plots are given for a range of speeds and headings (no head or stern waves as these cause no roll), for all 5 roll damping methods and current vessel at once. The vertical axis gives the roll response in degrees. The horizontal axis the regular wave frequency in rad/s.

The response is given for two different regular wave heights: 0.5 and 1.0 m. This is to illustrate the dependence of roll response to wave height. This means the plots are not strictly speaking RAOs, not even the plots that give roll response per 1.0 m wave, but RAOs for roll are not quite as meaningful as those for other motions, as explained in 6.1.

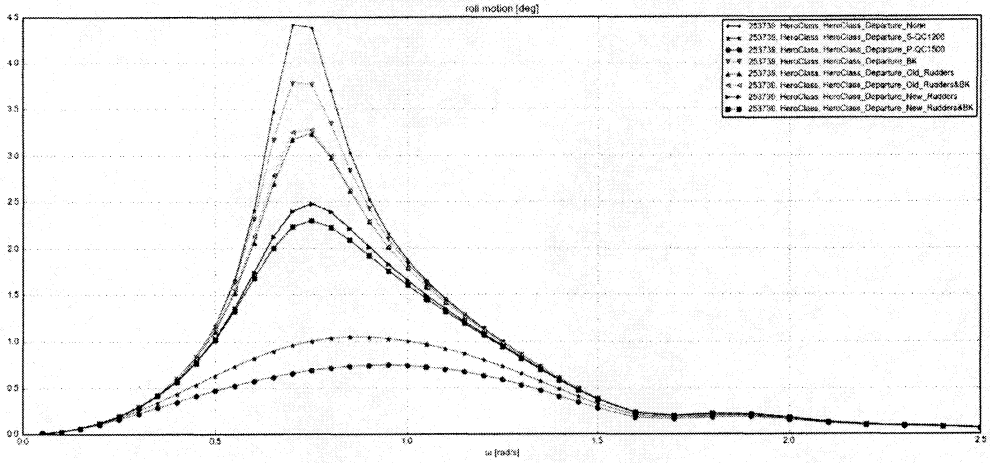
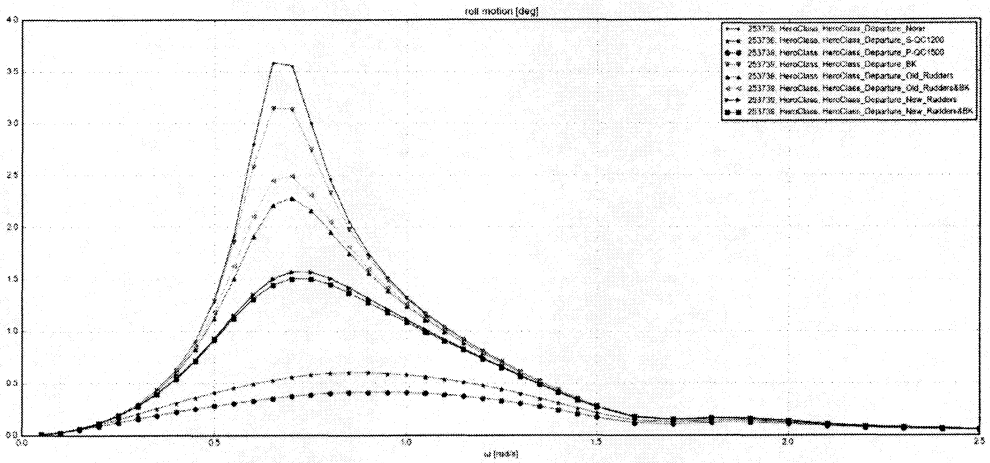
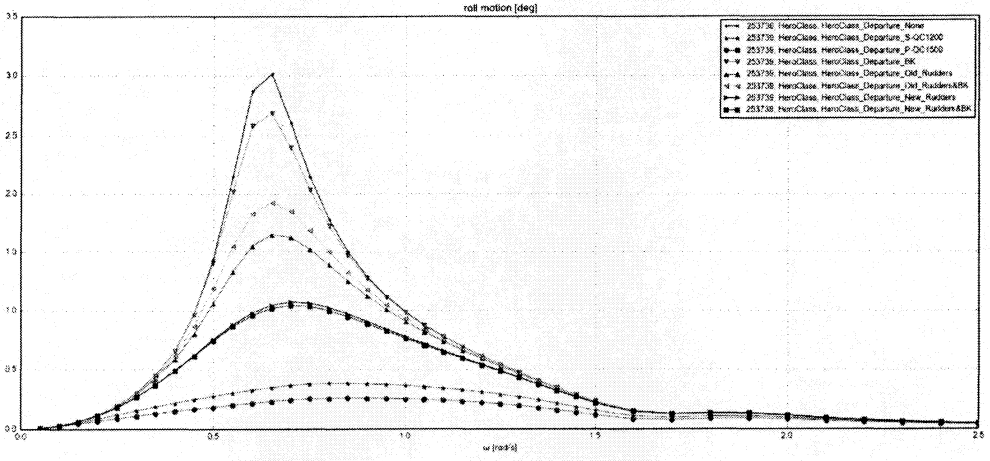
Roll RAO H = 1.0 [m] μ = 150 [deg]

Top to bottom: V = 15 [kn] V = 20 [kn] V = 25 [kn]







Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

7.2 Polar plots

The polar plots for roll and other variables are presented on the following pages.

Polar plots include heading variations in circumferential direction and speed variations in radial direction. The colours indicate the levels of response, mostly in RMS.

For each sea state and area combination the following plots are presented.

Variable	Response	Unit	# of plots
Roll	RMS	[deg]	6
Bridge lateral accelerations	RMS	[m/s^2]	6
RHIB station MSI	Probability	[%]	6
Pitch	RMS	[deg]	1
Bridge vertical accelerations	RMS	[m/s^2]	1
Sway accelerations	RMS	[m/s^2]	1
Heave accelerations	RMS	[m/s^2]	1
Green water events	Probability	[1/hr]	1
Bridge MSI	Probability	[%]	1

The first three variables are dependent on the roll stabilization method, which is why each method has its own polar plot. The remaining six variables were found to be roll independent or show negligible roll dependency. To avoid cluttering the results with too many plots, those variables are presented only once per sea state.

Since there are two different post processing tools used, there are small differences between MSI and green water plots on the one hand, and the RMS plots on the other. These difference include the omission of sea state information in the RMS plot headers. Also, in RMS plots the Bridge location is referred to as "ref_1" and Deck wetness as FEX_Deck.

The asymmetrical results in polar plots occur because some locations are defined away from centre line and therefore dependent on which side the waves are coming from.

8 Discussion and Conclusion

The discussion section below contains some general comments on the accuracy and right way of interpreting the results. The conclusion section contains several statements that can be made based on the results.

8.1 Discussion

The design of the appendages, i.e. dimensions and location and parameters, are first estimates, based on calculations or experience, and not to be taken as final values. The bilge keel design is by no means optimally positioned with respect to flow lines. If a more accurate design and resistance is required in the future, CFD analysis is recommended.

The software that is used is linear 2D strip theory. This means that the waterline plane of the ship does not change with waves or motions. This assumption is valid for small waves and motions, but becomes questionable for waves heights that exceed the draught. These limitations should be kept in mind when interpreting any of the results.

The roll damping linearization means that RAOs are not very meaningful to look at. This can clearly be seen when looking at the peak response of the unstabilised vessel in beam seas for 0.5 m and 1.0 m waves. The peak roll responses are around 11 and 17 degrees respectively, indicating it is by no means linear. It is therefore much more meaningful to look at RMS response in sea states.

The roll RAO plots show a dominant peak at the natural frequency, and sometimes other peaks at maximum wave excitation or roll-sway coupling frequencies. Generally speaking: the higher the velocity, the higher the roll damping.

There are some zero-encounter issues in the results, mainly visible for pitch. This occurs for stern (quartering) waves that travel with the ship, a dangerous situation that is avoided by captains. The mathematic of the tool failed to cope with this and pitch results where therefore cut and should be ignored for these headings.

MSI results are based on unaccustomed sailors and should therefore not be taken as absolute numbers. The MSI calculations are based on vertical motions, which is why there is no effect of roll on MSI in the COG for example. However, relative comparison is still valid between sea states and roll damping methods.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

8.2 Conclusions

The most relevant results are the RMS roll polar plots. The following conclusions can be drawn based on these:

- Shorter and higher sea states are worse for roll, particularly when peak periods are close to the natural roll period. JONSWAP is worse than Pierson Moskowitz. These two factors make the Great Lakes the worse region of the two.
- Active stabilizer fins are far superior to the other methods at high speed. The difference between the two fins (S- and P-series) is small at nonzero speed.
- Bilge keels and P-series are the only roll damping methods that act at zero speed. In general there is a turning point for which of the two methods is most effective. For low Hs the P-series is better. The lowest Hs at which bilge keels become better is at Hs = 1.3 m, at Tp = 6 seconds for JONSWAP spectra. Other peak periods and Pierson-Moskowitz spectrum will shift the turning points to higher Hs. See Appendix A for extra plots illustrating this effect.
- The active rudders using existing rudder controls are quite effective, but only at speed. They are better than bilge keels at max speed, but about the same at cruising speed. At zero speed they give no damping. Note that the existing rudder controls could be unsuited for the intense use required for active damping!
- The active rudders using new rudders controls are more effective than the existing ones, and perform somewhere in between existing active rudders and the stabilizer fins.

Based on the other plots the following conclusions can be drawn:

- Bridge transverse accelerations follow the same pattern as roll motion RMS.
- Motion sickness at the RHIB Launching station is influenced somewhat by roll stabilizers, mainly at speed. The effect is not very large, as roll is only one of three contributors, heave and pitch being the other two.
- The other variables are basically unaffected by roll. The coupling between them and roll is too small to be visible in the plots.

Based on the speed and range calculations, the following conclusions can be drawn:

- Active rudders are best for top speed and range, as these remain unchanged.
- Bilge keels and the zero-speed stabilizers are similar and worst for both top speed and range.
- The regular stabilizer fin performs somewhere in the middle.

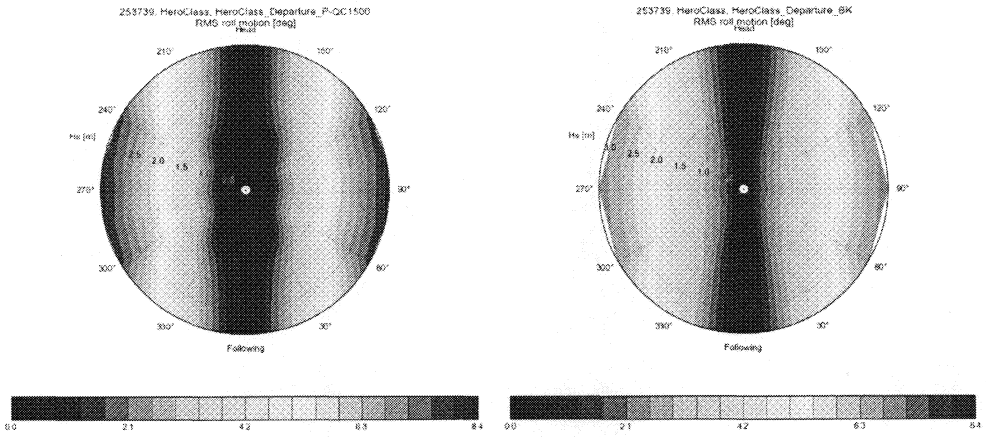
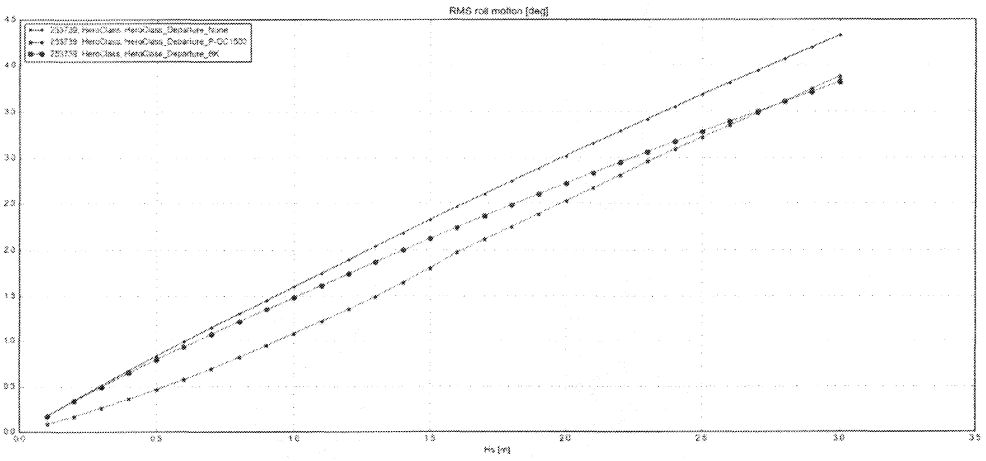
Appendix A Bilge keels versus P-series

Both bilge keels and the P-series fin give roll stabilization at zero speed. For low wave heights the P-series fin is better, but above a certain wave height (depending on wave period) bilge keels becomes better. Below are some results to show the performance of the two systems, both in polar plot for every heading and in graph form for beam seas only.



A 1. RMS roll for varying wave heights (radial direction) and headings. Tp = 6 seconds and spectrum type is JONSWAP.



A 2. RMS roll in beam seas at zero speed. Tp = 4 seconds.

Hey Meng,

Can you sort out and write up the agenda from this below and attached? You can ask Vitaliy to help you if you have any questions.

I might have some more stuff for you later in week.

But can you finalize the agenda and then print out 25 copies (staple) and bring to meeting?

More agenda topics as well as ones in the spreadsheet.

- Allied Crane FSR [redacted] to present and discuss the cranes – 10am to 12pm Thursday. Topics to cover – CT mode, how winches work, how belly pack works with CT mode, how to make adjustments, update on secondary safety system, wish list (load on belly pack, move crane boxes lower, etc)
- Maximo update 30 minutes wherever fits
- Drawing updates and way forward for as fitted drawing verification and redlining on Thursday for 45 minutes
- Wednesday morning with Wajax and Cullen – topics to cover – valve pitting, private Robertson and Constable Carriere failures, spares, Northern Lights generators
- Discussion on davit, rescue boat and Car hook maintenance – 1 hour either Tuesday or Thursday
- Stabilizers on Tuesday at 2pm with Lengkeek. Update on stabilizer study.
- Lunches 12 to 1pm each day, breaks around 10 and 3 for 15 minutes each day
- First day – roundtable and action item update
- Discussion on Lloyds survey schedules, continuous surveys, overboard valves at drydock and DSIP 1 hour
- Electrical items I sent you previously – 1 hour
- Wednesday night group dinner at Saltys (can you look up on internet and get address?) Dinner reservations at 6pm
-

I don't think that there is anything earth shattering here – the stabilizers fitted to most other Damen 4207s is the recommended solution for us.

The Quantum model S-QC1200.

Dave

Sent: March-15-18 3:51 PM
To: Wyse, David E; Kozarski, Vladan
Cc: [redacted] s.19(1)
Subject: RE: Presentation in Halifax to Hero Class annual working group

Hi Dave,

Following are our preliminary results:

CONCLUSION REVIEW OF DAMEN REPORT

If the Quantum P-QC1500 stabilizer fins would fit the hull and if the components would fit in the vessel, this would give the best results with regards to roll reduction and Sea Sickness Index.

Generally, second best with close results to the above is the Quantum Underway S-series active stabilizer system, model S-QC1200, which is fitted on several other Spa 4207s.

The Rudder Stabilization, combined with Rudder Stabilization with improved controls, works reasonable well at low speed, but not as good on speeds above 5 knots.

The Rudder Stabilization, combined with Rudder Stabilization without improved controls, works not as well, and we expect that the steering system will be overloaded and wear out fast, therefore not a good practical solution.

The bilge keels don't seem to do much in the RAO plots, but have reasonable effect at lower speeds in reducing roll angles, bridge transverse accelerations, and a small reduction in Sea Sickness Index .

RECOMMENDATION BASED ON SUPPLIER PROVIDED INFORMATION AND PRACTICALITY OF INSTALLATION.

The Quantum P-QC1500 fins do not fit the vessel's hull. The required HPU is too big and heavy. Large power requirement

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

The Quantum Underway S-series active stabilizer system, model S-QC1200, which is fitted on several other Spa 4207s is a feasible and is the recommended option. The best location is in the forward part of the engine room, similar to Damen design.

Rudder Stabilization is not recommended. It is very expensive, HPU heavy in weight and no room can be found Automatic control Unit and will require significant strengthening in the aft hull.

Bilge keels are the easiest / cheapest solution to add, consideration might be given to combine it with the active stabilizers.

More details for Quantum QC1200 active stabilizer system with 1.4m2 fins:

- System can be powered from supplied HPU (20ph) or likely from the existing hydraulic system onboard (hydraulic pumps driven from Main Engine PTO's). Possible to use generator PTO's if available (question has been posed to the Chief about this).
- Expect 80-85% roll-reduction at cruising speed of 15knots, 2m seas.
- Capable of partial zero-speed roll-reduction (approx. 30% @ 1m seas) – Requires optional HPU however.
- For active fin only option (i.e. minus HPU); this provides the greatest roll-reduction with the least installed weight (includes components, minus additional plate and stiffening i.w.o stabilizer units) and places that additional weight in the mid-ship area. By including the HPU (required for partial zero-speed capability), this places an additional 525kg in the aft end of the vessel. Otherwise, the main engines may have to be sped-up while idling.
- System will clash with some components and piping in the forward corners of the Engine Room and will require some relocation and re-routing of piping in these areas.

Attached is a spreadsheet with the information provided from suppliers and information about installation on the vessel.

I hope that is satisfactory for now. If you have any questions or comments, please do not hesitate to contact me.

Kind regards,

Hi Vladan,

Tuesday afternoon is no problem for me. Thursday could work also, but I need to know which day, so I can make firm plans for the other vessel survey.

Kind regards,

[redacted]

Hi there,

[redacted] It would be tight for me, but I will try. If I decide to travel on Tuesday morning (Feb. 20), could we pin the presentation early afternoon?

Thanks.

Vladan.

Hi David and Vladan,

I have to go out of town for a vessel survey the same week as the presentation. Would it be possible to pin the presentation on the 20th, so that I can have the rest of the week for the survey?

Kind regards,

[redacted]

Hi Dave,

Regarding the 3D model, can you work with Rhino?
Because we have the model in that format only and unfortunately it is without any equipment and systems in it.

Kind Regards,

Damen Services

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

I have been asked to do a presentation at the MSPV annual working group meeting detailing the results of the comparative analysis of the Hero Class stabilizers.
I have suggested that they also invite you are the author of the report and have the theoretical background. Would you be available and interested? It will be on either March 20th or March 22nd in Halifax, NS.

If yes, would Damen be able to fund the travel costs as a part of relationship building with Canadian Coast Guard?

Kind regards,

[redacted]

Joint Management Team Meeting
CCG and C&P
March 21, 2018 – DAY 2

1. Meeting details

Type:	In person				
Purpose:	Canadian Coast Guard/Conservation & Protection Joint Management Team meeting				
Meeting date:	March 21, 2018	Start	8:30	End	16:00
Meeting location:	1110 Howe Street, Holiday Inn & Suites – Vancouver, BC				
Co-chaired by:	Cédric Kinnard (CCG) for Tanya Alvaro and Brent Napier (C&P) for Judy Dwyer				
Secretariat:	Emilie Plows / Lise Loiselle				

2. Participants

Participant	Organization – Region	Title
Belliveau, Ron	C&P - Gulf - Moncton	Chief, Enforcement Operations
Byatt, Cyndi	CCG - Atlantic - Dartmouth	Superintendent, Operational Business
Emeneau, Fred	CCG - Atlantic - MSPV *G. Peddle S.C.*	Commanding Officer
Fulks, Jay	RCMP - Pacific - Vancouver	Liaison Officer
Gallant, Nicole	C&P - Pacific - Vancouver	Chief, Enforcement Operations
Grace, Michael	C&P - Maritimes - Dartmouth	Supervisor, Offshore Surveillance
Higgins, Linda	C&P - Pacific - Nanaimo	South Coast Area Chief
Hurley, Mike	C&P - Newfoundland - St. John's	Supervisor, Offshore Surveillance
Ivany, Gary	CCG - Headquarters - Ottawa	Director, Operational Support
Jersch, Russell	CCG - Western - Victoria	Marine Superintendent
Langlois, Jimmy	CCG - Central and Arctic - MSPV *A. LeBlanc*	Commanding Officer
Jones Larose, Nicole	C&P - Headquarters - Ottawa	Staff Officer
Kinnard, Cédric	CCG - Headquarters - Ottawa	National Manager, Maritime Security Operations
Loiselle, Lise	CCG - Headquarters - Ottawa	C&P Liaison Officer, Maritime Security Operations
Ludlow, Mandy	C&P - Pacific - Victoria	Acting North Coast Area Chief for Andy Lewis
Lynden, Al	CCG - Western - MSPV *M. Charles M.B.*	Commanding Officer
Morphet, Jason	CCG - Headquarters - Ottawa	Acting Manager, Readiness
Napier, Brent	C&P - Headquarters - Ottawa	Chief, Enforcement Programs
Burniston, Nancy	RCMP - Great Lakes - Niagara-on-the-Lake	Officer in charge, Marine Security Enforcement Team, Ontario
Picard, Marcel	C&P - Quebec - Québec	Chief, Enforcement Operations
Plows, Emilie	CCG - Headquarters - Ottawa	Acting National Liaison Officer, Maritime Security Operations
St-Pierre, Lisa	CCG - Central and Arctic - Québec	Marine Superintendent
Thirkell, Darcene	CCG - Western - Victoria	Superintendent, Operational Business
Wasson, Thomas	CCG - Central and Arctic - Sarnia	Deputy Marine Superintendent

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

	Joint Management Team Meeting **CCG and C&P** **March 21, 2018 – DAY 2**	

3. Agenda

Item	Topic	Presenter
1	Introductory Remarks and Roundtable	Cédric Kinnard/Brent Napier and All
2	Summary of Discussions from Day 1	Cédric Kinnard/Brent Napier
3	Requested CCR Updates	All
4	Vessel Class Standardization	Brent Napier
5	Season Summaries	CCG Commanding Officers and C&P Chiefs of Enforcement Operations
6	Future Meetings	Emilie Plows
7	Potential Support to Overall C&P Program – REMOVED	Emilie Plows
8	Potential Support to Other Programs	Al Lynden
9	LEFT Input from C&P	Emilie Plows
10	Summary of Action Items	Emilie Plows
11	Roundtable and closing Remarks	All

4. Meeting Report

1. Introductory Remarks and Roundtable

Welcoming remarks by Brent and Cédric and introduction of participants. Cédric says that the participants can express themselves in French or English.

2. Summary of Discussions from Day 1

Cédric briefly summarizes the items discussed with the Canadian Coast Guard (CCG) participants on Day 1 and Brent does the same for the items discussed with the Conservation and Protection (C&P) representatives.

3. Requested Change Configuration Request (CCR) Updates

RHIB

Brent says that the most important concern for C&P is deploying the RHIB (launch and recovery). After discussing the same problem for several years, the frustration level is high. C&P Senior management and Regions are very concerned by long-standing issue and ask that a solution be found as soon as possible to mitigate safety concerns.

Al Lynden says that this is not a safety issue, but one of convenience. There is a difference in perspective. Brent asks the CCG to find a short-term solution to bridge the gap between the two perspectives and to look at alternatives that will ensure that Fishery Officers feel safe. It is

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

proposed that a working group involving C&P, the CCG, the RCMP, and technical personnel focus on this concern and determine a critical path.

Gary acknowledges the importance of this technical concern. He mentions the challenges faced by the CCG when it wants to change or adjust a component on the MSPV. He also mentions that it (the CCG) must take into account the impacts on other factors such as the eventual installation of stabilizers and how the CCG could provide a safe platform. He adds that there will be compromises to make because there are several factors to consider.

Jay says that it is important to work together as opposed to the CCG working alone. Brent agrees. He asks Gary how long it will take to find a solution to this problem.

Nicole Gallant says that C&P spends 8-10 hours in the RHIB and that this is ineffective for what C&P needs to do. She asks to find a solution or mitigate the risk before installing stabilizers. Nicole mentions that they are considering towing the RHIBS behind them as a solution if nothing is done to address the issue.

[redacted]

s.16(2)
s.21(1)(b)

Gary says that communication is through the Joint Management Team meetings and adds that the stabilizers will have an impact and determine what happens next. He adds that this concern will be part of the discussions that he will be having with the MSPV Working Group the next day. He acknowledges that what is in place for now is not working well. What is wanted and needed for the RHIB must also be discussed. Gary mentions a feasibility study and consultations with engineering to look at different designs and that program and operational requirements will drive the technical requirements.

Ron says the RHIB used is not made for C&P and would like to see an improvement. He adds that after four years, C&P is frustrated at not receiving answers to their questions in terms of how long and what option will be implemented so they will be safe and comfortable.

Brent said that C&P is working within the scope of occupational health and safety, but they see no results. [redacted] Brent would like to see the critical path to finding a solution to this concern.

The launch and retrieval system currently in place results in safety concerns among Fishery Officers regarding foot entrapment, as well as fear of collision with the metal bars.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Gear Hauler

The *Corporal McLaren* will be the first of two vessels to receive it. The *G. Peddle* was not ready when it left dry dock. Fred reports that progress has been made and that once the vessel is ready, it will take about half a day to put them on. Mike Grace emphasizes the greatest need is for the vessel going to Gulf. Ron says that the same needs to be done for *G. Peddle* because while the old one works, it is not ideal; the issue is with resetting gear and not hauling.

Server & Storage / Connectivity

The needs on the East and the West Coasts are different. West coast would benefit from same solution as RCMP. Michael Grace says that he needs the satellite, but it is difficult to explain the problem to the Coast Guard technical personnel. He says that when working, the current connectivity suits their needs; he does not believe it to be the main issue and that he knows it comes at a cost. Both Maritimes and Newfoundland and Labrador Regions have a solution through the purchase of stand-alone mobile satellite unit (MSRTC system) that they will test. Jay mentions the *Privacy Act* and data integrity; should have unfettered access to the central data system.

Stabilizers

After the meeting with the MSPV Working Group, Gary will pass on the latest news about the solution. He estimates that it will take a few years to install them on the nine vessels.

Radar Transceivers

The noise is louder and higher pitched on the *Captain Goddard* than on the *M. Charles*, but it is not clear why. Mandy suggests that it is noise travelling through the vent. Using a shorter pulse was a suggestion to see if it would reduce noise. No complaints from *M. Charles*.

RHIB Operator Training

Emilie says that she has collected comments from C&P and will forward them to the CCG. There are some areas where Fishery Officers can operate the RHIBS, but not in all cases.

Brent stresses the importance of looking at various options and having training that is well-suited to their needs. C&P can take part in this training to feel at ease.

Nancy and Michael Grace share how the organization trains officers to maintain or develop improved skills.

Brent asks Emilie to follow up on this.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4. Vessel Class Standardization

Brent asks Gary how open and flexible the CCG is in the CCR process when it comes to particularities in each region. Gary explains that CCR processes are for more formalized changes. CCG acknowledges the program's differences in each region and are open to differences but not if change is significant. Common sense approach: vessels do not have to be identical but changes should be for a good reason.

Gary replies that the CCG needs to follow the program requirements. However, there may be particularities, as in the case of lobster trap haulers, where if you can't pull gear, it affects program requirements. C&P would like to note that a system is required to haul all forms of set gear and set nets where the appropriate hauler is attached. Jason adds that CCG fishery research vessels (e.g., the *Vladykov*) have some particularities that the other vessels do not.

Gary left the meeting at this point to go to the MSPV Working Group meeting in Halifax.

5. Season Summaries (from October 2017 to February 2018)

The following are additional comments made after the presentations by the CCG Commanding Officers and the C&P Enforcement Chiefs. A copy of these presentations is kept at Headquarters in Emilie's JMT file.

M. Charles / Captain Goddard

Al adds the importance of fully covering the region and welcoming another organization, such as the Canada Border Services Agency (CBSA) on board, to improve surveillance of the region. He also mentions that turnover of fishery officers is a challenge.

Jay also mentions that it would be beneficial, when the program allows, to work with other organizations in the coming years.

Nicole Gallant asks for a long-term solution to transceiver problems and data storage. Nicole adds that the CCG Electronics and Informatics group was fantastic at finding a short-term solution.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

G. Peddle / Corporal McLaren

Fred Emeneau for the CCG:

- *G. Peddle* was not used a lot due to sea conditions, spent 2 weeks in dry dock
- Would like to see the return of "constant tension mode" on the RHIB crane.
- The RHIB was used a lot for seizures this past fall; he says that the vessel still has no rope cutters but the other five do. Al says that the one on the *M. Charles* fell off anyway.
- Although the experience on-board the MSPV is interesting, not recognizing sea time is causing issues with employee retention.
- Other issues mentioned include seakeeping capability (high winds), exhaust flap, ice, and gangway.

Michael Grace for C&P:

- Presents a table showing the various sea conditions by situation; this table shows the probabilities of the MSPVs being anchored based on wind speeds and sea conditions.
- Also presents a video showing the situation that Fishery Officers and the CCG operator face during retrieval of the RHIB.
- Would like to be able to operate in a 20- to 25-knot winds to have more time on program.

A. LeBlanc

Marcel Picard for C&P:

- To present their work to the public, he suggested that his region do an advertising blitz. This was done through various media in the region, proved very effective and was much appreciated. This made it possible to promote C&P's, the CCG's and DFO's work, tools and equipment.

Other comments

s.16(2)

- Ron Belliveau thanks CCG personnel for their participation in the whale file.

s.21(1)(b)

- Marcel also mentions the collaboration with the Regional Operations Centre (ROC) and that the air surveillance aircraft was helpful.
- Mike Hurley says that the working relationship between C&P and the CCG is very good in Newfoundland and Labrador, [redacted] He also brings up the importance of properly communicating time frames during refitting.

6. Future Meetings

Emilie presents the list of current CCG-C&P meetings to discuss the possibility of improving the discussions at the Joint Management Team meeting.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

CCG-C&P Joint Management Team meeting: Acknowledges that the meetings in their current form are interesting and allow CCG and C&P concerns to be shared. Emilie suggests one meeting per year instead of two in the future and the participants agree.

It is suggested that the Joint Management Team meeting be held at the same time and colocated with the MSPV Working group meeting so that David Wyse, marine engineer and person responsible for following up on CCRs, can attend.

Brent agrees and asks how to add the RCMP to the meetings (Joint Management Team or other). It (the RCMP) could share its experience and certain elements because they also work on MSPVs.

Emilie suggests that it would be a good idea for Liaison Officers to attend some of these meetings. Agreement on the advantage of their presence as an opportunity to learn, to further improve working relationships, and to ensure the continuity of national files. Michael Grace and Cyndi also believe that the presence of Liaison Officers at the meetings would be helpful. Brent likes the continuity of their presence at the meetings.

Brent suggests that one RCMP representative and one C&P representative be involved in the MSPV Working Group meeting. Linda adds that a member from the law enforcement community would bring another perspective.

7. Potential Support to Overall C&P Program

Topic removed from agenda. More of a conversation for the program at Headquarters.

8. Potential Support to Other Programs

Al discusses an initiative on the west coast to use MSPVs to provide support to other departments. He says that the Vancouver area is a hub for drug trafficking and has a high crime rate. It is known as the "Vancouver model."

s.16(2)
s.21(1)(b)

Claire Doucette of C&P had been approached by the Canada Border Services Agency (CBSA) to spend 4-5 days on the vessel; this was moderately successful. The next time they were even busier and that started a working relationship between them.

[redacted] Jay says that sharing data—even sensitive information—with the CCG requires a risk assessment. Some information cannot be shared (e.g., regarding investigations). He adds that enforcement is complicated for all organizations. The discussion on security clearance levels resumes.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Brent cautiously approves the work with the CBSA from a Headquarters perspective. There are other departments that request support, such as Transport Canada and the Canadian Food Inspection Agency; the opportunity is there, but resources are needed so that assistance can be provided beyond the current program requirements. This would require further discussion and the relationship would have to be formalized, especially on the intelligence side. For the Coast Guard, this means including the work in the Fleet Operational Plan.

The relationship with the Marine Security Operations Centres is mentioned briefly in that it could be strengthened. Organizations in the centres were invited to give presentations at the Western Region MSPV Conference to discuss collaboration. Working in silos should be avoided.

9. Law Enforcement Familiarization Training (LEFT) Input from C&P

s.19(1)

It is mentioned that the C&P training chiefs should be involved in updating the curriculum. [redacted] a Fishery Officer on the West Coast, would be a good resource as a weapons specialist. Mike Hurley says that there are training standards for the Newfoundland and Labrador Region that Michael Grace could send us and he has provided comments on this previously. Brent decides that C&P at Headquarters funnel all relevant information to Emilie.

Jay says that it is possible to take some training online through the RCMP website, but taking online training is difficult for crew members. He encourages Brent and Emilie to get in touch with the RCMP training team in Ottawa; they can help provide access to certain training files. Emilie will work on this file after the G7 in June.

Russell says that it would be a good idea to formalize the live-fire training for the Arctic. Jason adds that someone at the CCG (Pierre Guilbeault) was hired under the Commissioner for the firearms file. He will see that a weapons safety policy is drawn up. Brent asks for follow-up on this file.

10. Summary of Action Items

- Harmonize the changes between the CCG and C&P into the following items:
  - Terms of Reference
  - Concept of Operations

- Create a working group to explore options and solutions for replacing the RHIB launch and recovery system. Determine the critical path.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

- Continue providing monthly CCR updates, especially on gear haulers, server and storage/connectivity, stabilizers, and radar transceivers.

- Coordinate CCG-C&P meetings:
  - Participation of Liaison Officers
  - Colocation of Joint Management Team and MSPV Working Group meetings
  - Program personnel representation on the MSPV Working Group

- Ensure prompt communication for any incidents on vessels (i.e., crane incident). Need a streamlined process.

- Collect feedback from program personnel on the Law Enforcement Familiarization Training course.

- Have a discussion between Fishery Officers and Commanding Officers on practice for RHIB operators.

- Share information on the installation of Toughpad docking stations.

11. Roundtable and Closing Remarks

Several people from both organizations acknowledge the collaborative effort between the CCG and C&P. These meetings help with the working relationship and it is nice to be able to demonstrate their value. Jay comments on both organizations' obvious enthusiasm.

Jimmy says that the same problems have been discussed for three years so there is a lot of work to do.

C&P comments that they are eager to see a solution for the RHIB cage. Brent is pleased with the progress made and requests focus on that item. He is also pleased to see the Maritime Security Operations group's desire to promote the resolution of issues. Cédric explains that Liaison Officers are not subject matter experts, but are listening and will make every effort to be transparent and to move things forward.

Nancy says that it is good to have C&P and the RCMP together in the same meeting. She also appreciates the CCG taking their concerns seriously.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

12. Other Topics Not on the Agenda

s.21(1)(b)

Whales: Gary asks if the plan is still to use MSPVs for towing whales. [redacted]

Toughpad installation: Michael Grace provides a presentation on the installation of Toughpads on vessels. The purpose of this solution is to address the issue of movement on vessels with equipment that will be installed permanently for all Fishery Officers. Michael is working with Tara Roberts (Fleet Delivery Planning Officer) on coordination.

Communication: Emilie explains that Liaison Officers share InfoPol bulletins with C&P when they concern health and safety; the information is also found on all vessels. Nancy asks Emilie to also keep the RCMP officers at Headquarters (Steve Barker and Jamie Solesme) in the loop.

1 INTRODUCTION

The Hero Class vessels are based on the Damen DSP 4207 design. This proven design was equipped with active stabiliser fins. Due to many changes to the original design the vessel had become too heavy and it was decided to drop the stabilizers to save weight and reduce hull resistance. The vessels are now known to be uncomfortable due to their rolling characteristics. Lengkeek Vessel Engineering Incorporated (LVE) has been tasked with performing a Comparative Analysis and a feasibility study for the installation of several roll stabilization configurations on the Hero Class vessels, based on the Seakeeping Analysis Report, prepared by Damen Shipyards Gorinchem (Damen). Damen Project number 253739, attached in Appendix C.

2 STABILIZER CONFIGURATIONS

The following stabilization configurations were analyzed by Damen:

a) None- current situation
b) Active stabilizer fin Quantum S-QC1200
c) Active zero-speed stabilizer fin Quantum P-QC1500
d) Bilge keels
e) Active rudder (existing rudder controls)
f) Active rudder (existing rudder controls) & bilge keels
g) Active rudder (new rudder controls)
h) Active rudder (new rudder controls) & bilge keels

3 REVIEW OF RAO PLOTS AND POLAR PLOT

3.1 RAO PLOTS

It appears that on all RAO plots, except the plots 7.1.7 V=0, 7.1.8 V=0, 7.1.9 V=0, the red line is the lowest (=best) response to the incoming waves, which is the Quantum Zero Speed & Underway P-Series, model QC-1500. In the 3 plots, where it was not lowest, it was still second best. In these conditions, where the vessel is at rest, (zero speed), it was outperformed by the bilge keels alone, and the combination of bilge keels and Active rudder, where the contribution of the Active rudders is minimal.

Except for zero speed, the 2nd best response is the dark green line, which is the Quantum Underway S-series active stabilizer, model QC-1200, which is fitted on several other Spa 4207s.

3.2 POLAR PLOTS

a) The polar plots for Great Lakes Sea State 5 and 6 – Roll, Departure condition confirm that at very low speed the bilge keels, with or without Active rudders provide the best roll reduction. At speeds over 5 knots the P-QC1500 work best, with the S-QC1200 being a close 2nd.
b) The polar plots for Great Lakes Sea State 5 and 6 – Bridge accelerations, Departure condition, give the same scoring results as above in section a).
c) The polar plots for Great Lakes Sea State 5 and 6 – Motion Seasickness Index show the worst approach angle of the waves is at between 210 and 240 degrees get and at higher speeds. In these analyses the P-QC1500 work slightly best both at low speeds as well as speeds higher than 5 knots, with the S-QC1200 being a close 2nd over 5 knots and

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

active rudder (new rudder controls) & bilge keels scoring 3rd at lower speeds. However, none of the systems shows to provide a significant improvement.

d) The polar plots for North Atlantic / Pacific, Sea State 5 and 6 – Roll, Departure condition confirm that at very low speed the bilge keels, with or without Active rudders provide the best roll reduction. At speeds over 5 knots the P-QC1500 work best, with the S-QC1200 being a close 2nd.
e) The polar plots for North Atlantic / Pacific, Sea State 5 and 6 – Bridge accelerations, Departure condition, give the same scoring results as above in section d).
f) The polar plots for North Atlantic / Pacific, Sea State 5 and 6 – Bridge transverse accelerations, Departure condition, show again that the P-QC1500 work best both at low speeds as well as speeds higher than 5 knots, with the S-QC1200 being a close 2nd and bilge keels with or without the active rudders scoring 3rd but only better at zero speed.
g) The polar plots for North Atlantic / Pacific, Sea State 5 and 6 – RHIB station, Seasickness index, Departure condition, show that just bilge keels at very speed give the best reduction. The P-QC1500 work best at speeds higher than 5 knots, with the S-QC1200 being a close 2nd over 5 knots. However, none of the systems shows to provide a significant improvement.

3.3 CONCLUSION REVIEW OF DAMEN REPORT

If the Quantum P-QC1500 stabilizer fins would fit the hull and if the components would fit in the vessel, this would give the best results with regards to reduction of roll, transverse accelerations in the wheelhouse and Sea Sickness Index.,

Generally, second best with close results to the above is the Quantum Underway S-series active stabilizer system, model S-QC1200, which is fitted on several other Spa 4207s.

The Rudder Stabilization, combined with Rudder Stabilization with improved controls, works reasonable well at low speed, but not as good on speeds above 5 knots.

The Rudder Stabilization, combined with Rudder Stabilization without improved controls, works not as well, and we expect that the steering system will be overloaded and wear out fast, therefore not a good practical solution.

The bilge keels don't seem to do much in the RAO plots, but have reasonable effect at lower speeds in reducing roll angles, bridge transverse accelerations, and a small reduction in Sea Sickness Index. It is the easiest / cheapest solution to add, and if no room can be found for installation of the active systems, it may be the only feasible option.

4 STABILIZER ARRANGEMENT OPTIONS

4.1 ACTIVE STABILIZING FINS

Initially three manufacturers of stabilizer fin systems were contacted to provide options for active and/or zero-speed stabilizers for the Hero Class vessels. At the time of this report, two manufacturers have provided to LVE, adequate information (i.e. dimensional drawings and component specifications) to allow a preliminary arrangement of components to be completed to determine the feasibility of having stabilizer fins installed on these vessels.

The first manufacturer to respond was Quantum who have provided two options for fin stabilizers. The first are model QC1200 stabilizers with S-Series active fins (1.4m2/fin) and the

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

second are QC1500 stabilizers with P-Series active/zero-speed fins (3m2/fin). Both systems can be supplied with a dedicated HPU suitable for active and zero-speed stabilizing of the vessel.

Rolls Royce also provided an option with the Gemini 10 model active fin stabilizer supplied with 1.1m2 fins. An HPU can be provided by Rolls Royce for this stabilizer model however at the time of this report, no dimensional or weight information was provided to LVE for the HPU. The Rolls Royce stabilizer units are approximately twice the weight of the Quantum units and included as part of their supply, a baseplate for installation that weighs more than the stabilizer unit itself. However, this baseplate can be modified to reduce some of the excess weight.

Dimensional drawings of the major components were provided by the manufacturers for the stabilizer systems and used with the ships machinery arrangement and structural section drawings to determine the arrangement and installation location options for the stabilizers within the middle third of the vessels waterline length. In addition, onboard surveys were conducted to view the potential locations to determine the extent of any clashes with existing components and with installed piping at these locations.

Two locations for installing stabilizer fins on the Hero Class vessels were investigated. The first area looked at was just forward of the Engine Room within the Motor Control Room on the port side and the Laundry/Stores room on the starboard side. Space and access limitations in these areas and a lack of available service space for the stabilizer units preclude any installation at these locations.

The second area considered was in the forward area of the engine room in the same general location where stabilizers have been installed on other Damen designed 4207's. This area provides more open space for installation and access to the stabilizer units, however both locations have existing components and piping installed that will require relocation and re-routing to allow room for the stabilizer units to be installed.

While arranging the stabilizer fins at Fr.16 within the engine room, it was determined only the smaller active fins (1.4m2) from both manufacturers could properly be installed without the fin width extending below the bottom of the vessel, or the fin length clashing with the hull chine when rotated upward. It has been indicated to LVE that the Quantum QC1200 system controller can be set-up to provide "partial zero-speed" capacity with the smaller fin still installed. It is assumed this is possible with the Rolls Royce option as well.

Sketches of the stabilizer components arranged within the vessel can be seen on LVE drawing. J18009-SK1, however these arrangements do not show the required structural supports for the installations. A list of components and piping affected by an installation at this location is included as part of the stabilizer comparison spreadsheet, J18009-R02. Section 4.1.1 below shows pictures of the stabilizer unit installation locations as seen on the Corporal McLaren.

The above comments apply to both the Quantum and Rolls Royce stabilizer options.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.1.1 INSTALLATION LOCATIONS FOR STABILIZER UNITS

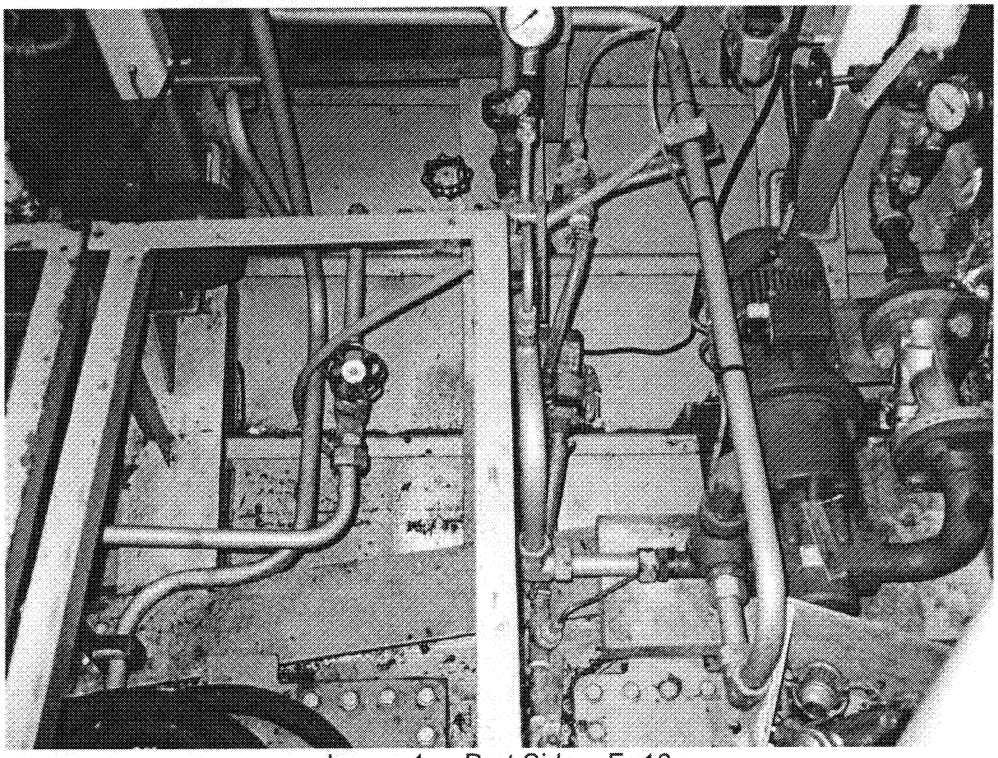

Image 1 Port Side – Fr.16

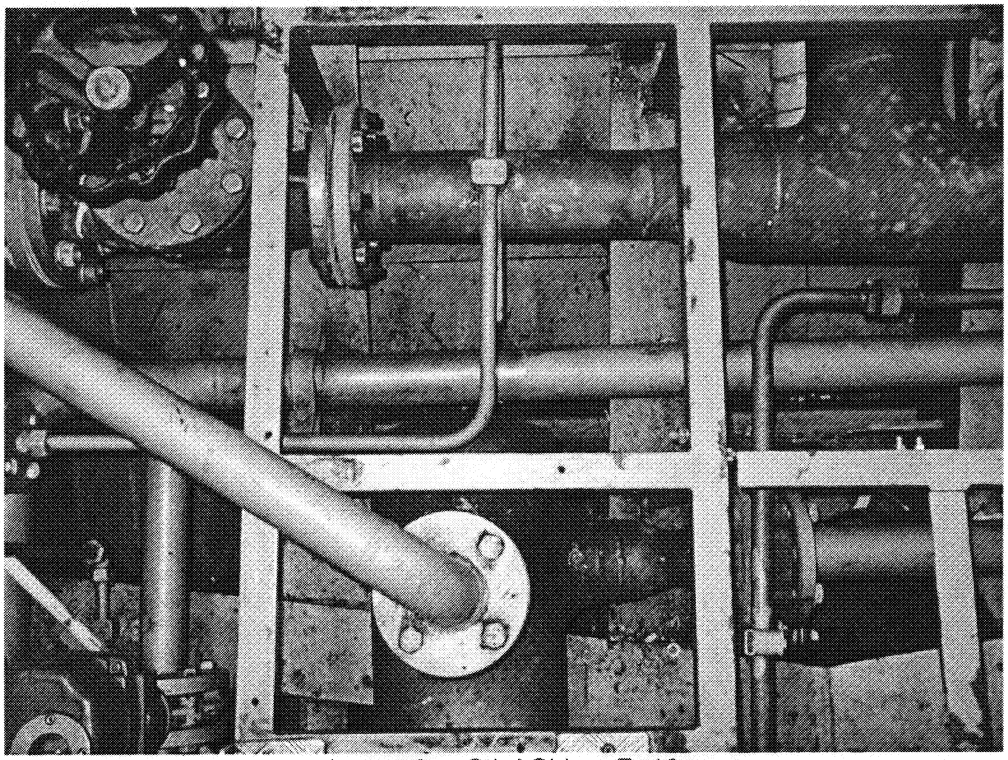

Image 2 Stbd Side – Fr.16

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.1.2 POWERING OPTIONS FOR STABILIZERS

Both Quantum and Rolls Royce can provide dedicated HPU's suited for the stabilizer models they have specified. An HPU provides a stand-alone, dedicated hydraulic system for actuating the fins while also providing partial zero-speed stabilizer capacity when the vessel is stationary, and the engines are idling. However, a new HPU represents additional weight on a vessel that is already weight sensitive with little available space onboard to accommodate the unit. The HPU's would require cooling water supplied from the ships sea water cooling system. LVE drawing J18009-SK1 shows a location for possible installation of an HPU within the steering gear compartment, however this restricts access within the compartment and is not ideal.

As zero-speed capacity is not a requirement for these vessels, this allows an alternate hydraulic system to be utilized. The existing ship hydraulic system currently powering the bow thruster and other components on the Main Deck should be investigated further to determine suitability for use with the stabilizing fins. A second possibility for powering the stabilizer fins would see the installation of a dedicated hydraulic system powered from a new hydraulic pump driven from an available PTO on the main engine or gearbox. If either option proves viable, the HPU would no longer be required thus freeing up space and reducing added weight to the vessels.

4.2 RUDDER ROLL STABILIZING SYSTEM

The option to modify the existing steering system to include roll stabilizing through rudder actuation was investigated briefly. The supplier of the existing steering system (Jastram) was contacted to determine suitability of the existing steering system to be modified/upgraded to provide rudder stabilization. In addition, RH Marine in Holland was contacted for their consideration on the suitability of installing this type of stabilization system onboard vessels like the Hero Class.

It was indicated to LVE that the Hero Class vessels are not suited for this type of stabilizing system. Firstly, the vessels are too small to warrant the installation while the system itself requires two new HPU's (larger and heavier) to replace the existing steering system pumps and a large control cabinet as well. Rudder roll stabilizing is usually planned during design stage of a vessel, not as a refit. To install this stabilizing system on the Hero Class vessels also requires a strength analysis of the existing rudder system and the aft end structure of the vessel and will likely require that both areas be significantly reinforced to account for the increased loads. The costs of the system components and the redesign of the rudder, supports and aft end structure will be significant in addition to not providing optimal stabilizing ability preclude the installation of this system

For these reasons, rudder stabilizing was no longer considered as a viable option.

4.3 BILGE KEELS (SINGLE AND DOUBLE-PLATE OPTIONS)

The installation of bilge keels has also been considered. Bilge keels provide decent stabilizing at zero-to-low speeds; however, their effectiveness drops off as speed increases. Bilge keels also increase hull resistance more than the stabilizer fins, which provide superior stabilizing at lower-to-high speeds. The main benefit of installing bilge keels on the Hero Class vessels is the simple nature of the installation. Fabrication and installation of bilge keels is straight-forward, and no interior space is needed within the vessel.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Bilge keels can be of single-plate, or double-plate construction depending on the depth of the plate and operating profile of the vessel. Options for both style of bilge keel can be seen on LVE drawing J18009-SK1.

The option to install both fin stabilizers with short bilge keels can be considered. The combination would provide additional zero-speed stabilizing in addition to very effective stabilizing at speed with the active fins but have a fair impact on speed and range.

4.4 STABILIZER DEFLECTORS AND SUITABILITY OF INSTALLATION ON WEST COAST VESSELS

The Hero Class vessels do experience an issue with catching lobster trap lines and other lines near the surface with the transducer appendage. With this in mind; installation of any stabilizer fin system should also consider the installation of line deflectors forward of the leading edge of the fins, or other measure to prevent the pinching of lines between the hull plating and the inboard edge of the fin. Any installation of bilge keels should have a sloped forward edge to direct any incoming lines out and past the bilge keels.

The Hero Class vessels on the west coast of Canada regularly encounter drifting logs also called deadheads. This issue shall be considered heavily when making the determination to install either fin stabilizers, on those vessels. Rope deflectors as described above will not be adequate to protect any new large appendages from hitting a wooden mass at speed.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

5 SUMMARY AND CONCLUSION

The Quantum Zero Speed & Underway P-Series, model QC-1500 fins would give the best performance in reducing roll and accelerations of the vessel. However, the P-QC1500 fins do not fit the vessel's hull and the required HPU is large, heavy and difficult to install in the vessel.

The Quantum Underway S-series active stabilizer system, model QC1200, which is fitted on several other Spa 4207s is feasible given the relocation of components and re-routing of piping at the installation locations is acceptable. The best location is in the forward part of the engine room at Fr.16, similar to the Damen design.

Rudder Stabilization is not recommended. The system requires two larger HPU's to replace the existing steering system hydraulics with little space available and is very expensive. There appears no room available for the Automatic Control Unit and this system will require significant strengthening in the aft hull and rudder support structure. All added weight to the aft end of the vessel.

Bilge keels are the easiest / cheapest solution to add and give the best roll reduction at zero speed. For the vessels on the West Coast this may well be the best solution as floating logs in the waters will likely damage the fin stabilizers at speed. In the Great Lakes and on the Atlantic Coast consideration might be given to combine the bilge keels with the active stabilizers to improve both zero-speed and higher speed roll reduction.

More details for Quantum QC1200 active stabilizer system with 1.4m2 fins:

- System can be powered from supplied HPU (20hp) or likely from the existing hydraulic system onboard (hydraulic pumps driven from gearbox PTO's). Possible to use generator PTO's if available (question has been posed to the Chief about this).
- Expect 80-85% roll-reduction at cruising speed of 15knots, 2m seas.
- Capable of partial zero-speed roll-reduction (approx. 30% @ 1m seas) – Requires optional HPU however.
- For active fin only (i.e. minus HPU); this provides the greatest roll-reduction with the least installed weight (includes components, minus additional plate and stiffening i.w.o stabilizer units) and places that additional weight in the mid-ship area. By including the HPU (required for partial zero-speed capability), this places an additional 525kg in the aft end of the vessel. Otherwise, the main engines may have to be sped-up while idling.
- System will clash with some components and piping in the forward corners of the Engine Room and will require some relocation and re-routing of piping in these areas.

The launching / retrieval of a FRC in high sea states is most likely the operation in which the rolling of the vessel makes it difficult to perform. If this operation needs to be performed at zero speed, adding bilge keels will probably be the best solution. If this operation can be performed at 5 knots speed or more, the addition of stabilizer fins will be a much more effective solution.

If DFO / CCG decide to go with any stabilizer system installation, LVE recommends the following steps:

1. Install one or more of the candidate vessels with accelerometers to measure motion characteristics of the vessel(s). Crew to log wave height, speed and heading to verify calculated values. Record power / vs speed.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2. Perform a full engineering package for the installation, including strength analysis of hull i.w.o. stabilizers, repositioning of equipment and rerouting of piping and wiring in way of installation, design of foundations for stabilizers and ancillary equipment. Load analysis and one-line diagrams for powering and control of equipment.

3. After installation, repeat the measurements with accelerometers and verify the effectiveness in roll reduction prior to installation on other vessels.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Subject: Hero Class load line meeting

Good morning Captains,

After our face to face meeting in Halifax, it is apparent that we need to have a meeting with Hero Class vessel captains to determine the way forward with the vessel load lines and weight issues. With all the new CCRs including possibility of stabilizers we have to make decisions on the way forward.

What is the best and realistic way to get a majority number of Captains in a meeting to make some decisions on the way forward in regards to Load line and weight management? This meeting has to happen shortly (months) for us to plan the way forward with some major CCRs (stabilizers)

- Face to face meeting?
- Teleconference?

My suggestions

Gary recommended that Emilie set up two separate meetings with the RCMP and C&P to review the Technical Statement of Operational Requirements (TSOR) for their organizations. David can provide the document to Emilie for circulation. One of the items Gary would like to review with the RCMP is the requirement to have two RHIBs to be able to be launched in a sea state 4 condition. David would also like to review the requirement to have gasoline outboards instead of diesel inboards on the Rhibs.

Before looking at options on modifying the RHIB launch and retrieval system, the impact of the installation of stabilizers (for seakeeping) needs to be evaluated. The recommended solution for the MSPV class of vessel is an active fin stabilizer. The least intrusive way to install the stabilizers would be to have an independent hydraulic power pack installed with the stabilizers. This would add more weight to the aft of the vessel. The vessels are currently at the weight margin and discussions will have to take place shortly on next steps to control the weight and deal with the load line.

Subject: Meeting notes review

Hi Jason and Dave,

Can you do a quick review of the notes and action items from the meeting on Friday?

From this point on, will one of you be official chair of the meetings/teleconferences? I'll take care of the logistics for them.

I'll send out the TSOR to the program heads for RCMP and C&P. I'm not sure I'll be able to organize something for next week before I'm on travel for a week and half, so I'll aim to set up those meetings when I'm back in the office first or second week of June.

Thank you,

Email about stabilizers I received this week. Just for info that this is a pressing problem for years now.

Stabilizers – I know this isn't E&I but we need these. I'm rolling 15 degrees port and starboard (30 degrees in total) out here today and the winds are less than 10 kts and seas are less than 1m. We need to make this platform more workable. Can we get the installed in our refit in November?

Subject: RE: Pour respecter la ligne de flottaison en eau salé

Thanks Natasa,

I have approval from Operations to have a face to face meeting with the Commanding Officers of the Hero Class to come to a decision whether they agree with moving the loadline up and increasing the weight margin. My question is – do I move forward with organizing this meeting or does a lightship and incline on the ships have to be done first?

2nd question – in order to determine weight growth and VCG increase, is that a lightship and incline experiment respectively?

Dave

Subject: RE: Pour respecter la ligne de flottaison en eau salé

Hi David,

I'm not sure what caused CCGS A. Leblanc to be heavier after the winter refit period, however it is an indication that either lightship weight, or deadweight, or both grew over the time. If crew can verify the effects, spares and tools, and other typical deadweight items as well as the cumulative weight impact of the CCRs implemented on the CCGS A. Leblanc over the past years, we could comment on the possible reasons for the current situation with the load line.

Before proceeding, it is important to note that the results of the following study were presented to Operational Support and it was decided by Operations that no change in the Load Line was to be accepted at that time. Can you please confirm that you have the approval of Operation to proceed with this request?

ITS/ME conducted "*Hero Class Life Service Weight Growth Assessment*" in 2015, for details of the assessment see EKME #3502569. In the executive summary it was concluded that Hero Class vessels:

- have very good intact stability with a good intact stability margin for potential lightship weight and vertical center of gravity (VCG) growth,
- have achieved values for deck wetness indices that are acceptable i.e. lay within the range of typical criteria and
- are shown to have good damage stability for all loading conditions considered in the existing damage stability book and to fully meet requirements of TCMSS *Passenger Vessels Operations and Damaged Stability Standards* TP10943 Part II, Sections 7(2) &9(1). This is all subject to the lightship weight growth margin of 4.406 tonnes and lightship VCG growth of 6 mm. Potential lightship weight growth over that margin is very small if the ship is required to meet fully the requirements of the same passenger damage stability standard.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Since the Hero Class ships are not classed as passenger vessels, ITS/ME has researched alternate standards for damage stability that could be considered applicable and then assessed them against these alternate standards. Based on the work done in this regard, ITS/ME has derived a new lightship weight and VCG growth margin of 10.5 tonnes and 30 mm.

It was also emphasized that increase in life service weight would mean increase in design draft, and if acceptable to Class, will require further verification of existing scantlings, speed performance and revision of stability books.

At that time CCGS Private Robertson was selected to be assessed based on the facts that it is the first ship in the class, it operates in fresh water and results in fresh water are more conservative than those in salt water. This meant that we considered all nine vessels as a class and this study was applicable across the Hero class.

In order to revisit this study it is necessary to confirm:

- what the actual weight growth and VCG increase is from the date each vessel was delivered to CCG and
- if the weight growth is consistent across the Hero class i.e. is the study still applicable for all nine vessels.

If weight growth and VCG increase is such that it does not impact results of the study, next step would be to verify existing scantlings, speed performance and revise stability books for the new design draft. This work would be subject to the Class approval.

If weight growth and VCG increase significantly changed and does impact results of the study we will have to revise study first. Also, if the weight growth is not consistent across the Hero class, results from analysis that considered CCGS Private Robertson only may not be applicable across the class.

If information on weight growth and VCG increase is not available, and there is a clear indication that weight (deadweight or lightship or both) increased like in a case of CCGS A. Leblanc, we cannot use the existing study as is to move forward and revise the load line until we confirm the lightship weight and VCG of all nine vessel. For example, if the A. Leblanc must now carry 4 tonnes of fuel less, that is an indication that the weight growth on that vessel could be in the order of 7.5 tonnes at this point, and a weight growth from this point would not be 10.5 tonnes, but 3 tonnes (VCG – unknown). With the proposed 50 CCRs as well as the desired stabilizers, these vessels could well be left with a very minimal through life growth.

Cc: Kozarski, Vladan; Morphet, Jason (NCR); DeAngelis, Vincenzo; Plows, Emilie
Subject: FW: Pour respecter la ligne de flottaison en eau salé

Hi Natasa,

The email thread below shows that after the winter refit period the A. Leblanc has to take on 4000 litres less fuel to keep the load line above salt water.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

My plan along with operations was to have a meeting with the Captains of the Hero Class to revisit moving the load line up on the vessels to give us more weight margin. It is a high priority for Hero Class program partners to add stabilizers to the vessels along with approximately 50 other CCRs that have been approved that may add weight to the vessel.

I would like to confirm that stability wise it is still ok for the Hero Class to move forward with plans of moving the load line and adding more weight to the vessel.

Thank you
Dave

Subject: RE: Sea state operation of vessels

Hello Dave,

You are correct that the MSPV TSOR says up to sea state 5 for programs and sea state 6 for secondary missions, and that is all we have ever received for instruction. Design and size definitely plays a big part. As well as area of operations.

I would like to point out that the Beaufort scale we use for sea state is based on events on the Ocean. I have always had trouble with the numbers in the TSOR as I know that sea state 6 says winds of 22-27 and waves heights 3-4M. On the ocean a 3-4 M swell would not be too bad, but a wave of that height on the lakes would be un workable in my opinion. The wave period is much shorter and would be very violent for the ship. I personally feel It would be unsafe to operate in that condition. I certainly would not want to have work in a beam too sea in anything more than a 1.5M sea without stabilizers. This ships rock like crazy tied to the dock!

Not sure if this is what you are looking for or not, but I hope it is a help.

Regards

Steve

Subject: Sea state operation of vessels

Good day Captains,

There is a risk based analysis of maritime SAR being done and there is questions concerning what sea state the vessels can operate in. As Captains how do you know this? Is there anything in writing? I can find that in the MSPV TSOR it says primary programs up to sea state 5 and secondary missions up to sea state 6.

So does it go by vessel design or is it always up to the Captain and then the question is how do you decide?

Thanks for your help

Dave

s.19(1)

Hey Vince,

Stabilizers are still a high priority as seen below. I just wanted to touch base to ensure that these are the next steps and give updates to the MSPVs and program personnel.

1. Any further work for the installation of stabilizers is on hold
2. Meeting next week with Ops to recommend that all the Hero Class be lightship surveyed and inclined tested ASAP.
3. Lightship survey and incline test will give next set of information required to determine if the load lines can be moved?
4. Once Ops determines that the load lines can be moved then that is the information we require to begin engineering on the stabilizers.

Thanks
Dave

Subject: RE: Sea state operation of vessels

Hi Dave,

Sorry for taking so long to answer,

I've been on this ship for 2 years now and I've seen 4 m waves a few times in the Gulf. I would not be pleased to head out for SAR in these conditions. The ship will take it, but the crew would be in bad shape upon arrival on scene.

Right now we are in the middle of the Gulf with a SW wind on the beam of just 15-20 kt and 1.5-2.0m waves , and I have to divert 20 degrees off my direct course to have the sea a little more on the hip to avoid rolling 20° either side. And the 10 kt speed limit doesn't help at all !!

So before going out for SAR in these conditions, I would consider my crew's state of fatigue, the distance to go, the course relative to the waves, and of course the vessel design.

By the way, stabilisers should never have been removed from the original design, please put them back asap ! Losing a few cubic meters of fuel space will be a minor factor compared to the huge gain in stability, safety and comfort for the crew.

Hope this helps,

Objet : RE: Sea state operation of vessels

Hello Dave,

You are correct that the MSPV TSOR says up to sea state 5 for programs and sea state 6 for secondary missions, and that is all we have ever received for instruction. Design and size definitely plays a big part. As well as area of operations.

I would like to point out that the Beaufort scale we use for sea state is based on events on the Ocean. I have always had trouble with the numbers in the TSOR as I know that sea state 6 says winds of 22-27 and waves heights 3-4M. On the ocean a 3-4 M swell would not be too bad, but a wave of that height on the lakes would be un workable in my opinion. The wave period is much shorter and would be very violent for the ship. I personally feel It would be unsafe to operate in that condition. I certainly would not want to have work in a beam too sea in anything more than a 1.5M sea without stabilizers. This ships rock like crazy tied to the dock!

Not sure if this is what you are looking for or not, but I hope it is a help.

Regards

Steve

Subject: Sea state operation of vessels

Good day Captains,

There is a risk based analysis of maritime SAR being done and there is questions concerning what sea state the vessels can operate in. As Captains how do you know this? Is there anything in writing? I can find that in the MSPV TSOR it says primary programs up to sea state 5 and secondary missions up to sea state 6.

So does it go by vessel design or is it always up to the Captain and then the question is how do you decide?

Thanks for your help

Dave

Subject: RE: MSPV TSOR Review Notes / Notes de l'examen de l'ÉTBO des patrouilleurs semi-hauturiers

Good morning Nicole,

Op Support and Marine Engineering are aware that changing the launch and retrieval system is C&P's number one priority, but before they can make any modifications, they need to install the stabilizers. As part of that process, as the vessel's load line is currently at maximum, they need to see where adjustments can be made to minimize the weight, which is why they did a review of the TSOR with each program. I've tried to capture this on the action plan I've been sending out each month.

The Coast Guard has a safety requirement that all the RHIBs need to be self-righting and a cover would impede that. The RCMP are talking about a "clip on" type shelter, but it only covers the operator and it hasn't been approved yet by Op Support. I'm not sure if they can provide other options.

Subject: RE: MSPV TSOR Review Notes / Notes de l'examen de l'ÉTBO des patrouilleurs semi-hauturiers

Thank you Emilie for putting this together. Below I noticed that we do not mention changes to the RHIB to have some kind of cover or change to the launching system. Is this being reviewed? s.16(2)

Comment(s):

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

- C&P: modified launching by stopping the vessel and people climb into the RHIB once it is lowered. 99% of the time, the vessel is stationary.

Hi everyone,

As part of the MSPV Partner Working Group, on June 28, Operational Support, Marine Engineering, and C&P reviewed the Technical Statement of Operational Requirements (TSOR) for the MSPVs. Representing C&P were: Marcel Picard, Andy Lewis, and Genevieve Cauffopé.

Please find attached the English and French versions of the notes from that teleconference. For those who have access to EKME 3933971 and 3949599.

If you have any questions, please let me know.

Bonjour à tous,

Dans le cadre du Groupe de travail de partenaires sur les patrouilleurs semi-hauturier, le groupe de Soutien aux opérations, l'Ingénierie navale, et la C&P on fait une révision de l'énoncé technique des besoins opérationnels (ÉTBO) pour les MSPV. Les représentants pour C&P étaient : Marcel Picard, Andy Lewis, et Genevieve Cauffopé.

Veuillez trouver ci-joints les notes de l'appel téléconférence. Si vous avez accès à EKME, ce sont les documents 3933971 et 3949599.

N'hésitez-pas à communiquer avec moi si vous avez des questions.

Subject: CCRs for Hero Class vessels that may increase weight

Hey Vince,

Here are some CCRs to be done to the Hero Class vessels that might increase the weight of the vessels over 100kg. Also note there are other CCRs that may decrease the current weight of the vessels.

CCR 2587 – Stern Quarter reinforcement – already done on Private Robertson
CCR 2693 – fuel tank #9 venting arrangement – done on various vessels
CCR 2699 – fire main piping replacement – sections done on various vessels
CCR 2850 – Hero Class flooring replacement – sections done on various vessels
CCR 2864 – Hero Class biofouling solution – done on M. Charles and Captain Goddard
CCR 2867 – Hero Class impressed current installation
CCR 3103 – Hero Class stabilizers
CCR 3219 – Hero Class engine removal and overhaul
CCR 2396 and 3220 – Hero Class galley reconfiguration

Subject: Hero Class CCR update

Good day all,

Here is my most recent list of Hero Class CCRs attached in the excel file. Remind me if I am missing any.

Any large weight implication CCRs are on hold by the Naval Architecture manager and HME manager. There is a meeting with Ops support tomorrow to request that lightship surveys and incline tests be done on all ships before installation of such items as stabilizers or stern fendering, etc.

The table below shows the E&I priority list we have delivered for engineering. Priorities 3 and 4 have regional teams developing solutions. Priority 1 – a new CCR had to be registered because the dual dome was rejected and Priority 2 was just approved for engineering. I hope to get engineering leads soon. CCR 3281 – Chart table and CCR 3284 AIS antenna relocation are new ones added. I put them as priority 5 and 6. Let me know if they have to move up or down.

Voici ma liste la plus récente des DCC de la classe Héros jointe au fichier Excel. Rappelez-moi si j'en manque.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information

Les principaux DCC à implication de poids sont en attente par le gestionnaire de l'architecture navale et le gestionnaire HME. Il y a une réunion avec les Opérations a AC demain pour demander que les lightship survey et incline test soient effectués sur tous les navires avant l'installation d'éléments tels que des stabilisateurs.

Le tableau ci-dessous présente la liste de priorités E & I que nous avons livrée pour l'ingénierie. Les priorités 3 et 4 ont des équipes régionales développant des solutions. Priorité 1 - un nouveau RCC doit être enregistré car le double dôme a été rejeté et la priorité 2 vient d'être approuvée pour l'ingénierie. J'espère obtenir rapidement des groupes d'ingénierie dans les regions. DCC 3281 - La table à cartes et le repositionnement des antennes AIS du DCC 3284 sont des nouvelles ajoutées. Je les mets en priorité 5 et 6. Dites-moi s'ils doivent monter ou descendre.

Engineering	Priority	
CCR 3271 improve satellite reception	1	
CCR 3148 Secure AIS for MSPV Rhibs	2	
CCR 2712 Navigation information in the CO Cabin/Office	3	Great lakes region developed solution?
CCR 3089 Echo Sounder Replacement	4	Western region developing solution for September drydock
CCR 3281 Chart table reconfiguration	5	
CCR 3284 AIS Antenna relocation	6	
CCR 3016 GMDSS Sailor 5000 replacement	7	
CCR 3222 ICS Replacement solution	8	
CCR 3258 Wind information in Vision Master	9

CCR Prioritization List for MSPVs

EKME # 3045741v1 Updated 2014/03/07 (*L. Richardson original author*)

MSPV Internal Communication System (ICS) modification	Existing Conditions Heise McCann ICP Internal Communication System is the as fitted ICS system on the MSPV vessels. It has been difficult and costly to maintain the PA portion due to low reliability of the speakers. There are also nine different models of speakers on the vessel which makes keeping them all in stock a challenge. Heise McCann, located in Florida, is the only distributor of their products. They do not have any authorized resellers and much of their equipment is made to order and ships internationally so the lead time to order spares is quite long (average of 3 months). In FY 2015/17 the cost to maintain the ICS systems on the two Atlantic Region MSPV's combined was $37.3K and in FY 2015/16 the cost was $28.7K. Recommended Solution: Replace with a modular system whose manufacturer has local suppliers and/or service representative. Standardization with other new vessels in the fleet would also be of benefit to minimize training requirements for staff and required held spares would decrease with commonality of systems. Anticipated Benefits: Decrease maintenance costs. Impact on Maintenance/Operational Budget: High maintenance costs and difficulty acquiring spares.		Select System	N/A	Jodie Lechere			Acknowledged	2018-02-14: Ack. CCR Registration. To MSPV Committee. Sections 3 and 4 should be completed. 5 and 6 must be Supported (E-Signatures) by Committee. CCR will be sent for Review/Support by CCR Committee, then to CCB for Approval										
MSPV pompe circulation eau chaude	Présentement la pompe pour la circulation d'eau chaude du réservoir est une pompe en provenance d'Europe. Les pièces sont dispendieuses et donnent de fois. Cette pompe est alimenté avec du 600V pour une pompe qui fait seulement que circuler de l'eau chaude dans le navire. Solution : Il est recommandé de remplacer la pompe avec une petite pompe de circulation TACO 110-24. En acier inox certifié NSF61 pour lequelle les pièces sont facilement disponible. L'alimentation pour cette pompe viendra du panneau principal. L1-24. Nous pourrons utiliser l'alimentation 600V pour la pompe dédiée au levage de la chaine d'ancre et réutiliser le démarreur. Impacts: Nous aurons de la facilité à avoir des pièces de rechange pour ce système. Si la pompe n'est pas remplacée nous condamnerons d'avoir des problèmes apprentissonnement pour les pièces et nous devrons avoir un nouveau démarreur pour la pompe de levage de chaine d'ancre.		Kenworth Systems	Hot water circulation pump	Isabelle Caillard Deschênes			Approved for engineering	2018-05-25: Ack. CCR Registration. sections 3 and 4 should be completed. 5 and 6 must be Supported (E-Signatures) by Regional Authorities. CCR must be Signed and returned to NCCR Coord with documentation. Major CCR will be sent for Review/Support by CCR Committee, then to CCB for Approval. 2018-06-06 CCR Supported by Region Routed to Committee to Rev./Support. 2018-07-26 Supported by Committee Routed to CCB seeking Engineering App't. 2018-08-03 CCB: Approved for Engineering	3001305							
MSPV pompe traitreat système d'eau noires	Présentement l'alimentation électrique de la pompe macérateur de transfert est une pompe monophasée 230V. Ceci a pour conséquence que le moteur travaille plus fort pour faire des démarrages et ce système est un système qui est appelé à démarrer et arrêter souvent. Solution : Il est recommandé d'acheter un moteur triphasé de 1.1 KW pour faire tourner une pompe équivalente que propose Hoverarm le remplacer du système d'eaux noires. Il est recommandé d'ajouter l'électricité triphasée à partir du panneau L1 Jodies 18. Impacts : Le bénéfice anticipé est de remplacer moins souvent le moteur électrique.	système électrique/ système eaux noires	18D	Systèmes de collecte, de traitement et d'évacuation des eaux	Isabelle Caillard Deschênes	All Vessels	Auxiliary Systems	Approved for engineering	2018-05-25: Ack. CCR Prioritization List for MSPVs

EKME # 3045742v1 Updated 2014/03/07 *(J. Richardson original author)*

[illegible]	[illegible]																			
Crab pot hauler arm extension	the trap hauler modification is to extend the arm as depicted in the engineering drawings to gain clearance over the railing. The arm would be fitted with a small block for the rope to travel on and the hauler would be mounted to the deck, that way when traps were raised to the ships side crew aren't leaning over the railing trying to pull them over the railing, instead the bottom of the traps should clear the railing making it a lot easier to bring on board. By not having the hauler hanging from the arm it also makes it easier to get the traps on board because someone doesn't have to guide the lead line on each trap through the hauler while two other people are trying to haul the trap over the railing Lobster traps in the Bay of Fundy region have concrete bottoms to combat the tide and can weigh 80-100lbs per trap without bait or catch so hauling them over the rail in strings of 18 or 21 traps per set has been very labour intensive.					Dave Wyse	Captain G. Peddle			Approved for prototype										
MSPV Additional at will whistle button	The only at-will whistle control within the bridge is located on the far starboard side. It is a tiny button mixed in on a panel with 28 other very similar buttons. Add an at-will whistle push button near the centre of the bridge consoles. This would require a cable to be run from the whistle control panel under the consoles and a hole to be drilled in a suitable space near the middle of the consoles. This should be a straightforward job. Able to sound the ship's whistle at-will quickly and without error from any of the forward bridge positions. Consequent increase in safety of navigation. There is a safety risk that in an emergency or close-quarters situation, when a sound signal is immediately required, it will not be sounded, in a timely fashion, or the wrong signal will be sounded, or some of the bridge team will be distracted trying to find the correct button. This could result in a collision			Vessel Communications and Navigation	Whistle	David Wyse	david.wyse@dfo-mpo.gc.ca	8133628263	Routed to CCB	2018-01-01: Ack. CCR Registration. CCR Prioritization List for MSPVs

EKME # 8045741v1 Updated 2014/03/07 (L Richardson original author)

Remplacement valve VS20055	Suite à un exercice d'une procédure ISM de l'armatrissement du compartiment du propulseur d'étrave, une situation préoccupante a été observée. Pour activer le pompage du compartiment envahi il faut démarrer la pompe incendie d'urgence et ouvrir manuellement et directement sur place la valve (VS20055) qui alimente le venturi d'aspiration directe (ES20003). L'effet venturi provoqué va aspirer l'eau et la diriger par-dessous bord en passant par la valve de risque(VS20058). L'Ouverture ou la fermeture de cette valve (VS20055) se fait directement à l'intérieure du compartiment inondé Donc il y a un risque d'ouvrir la porte étanche et inondé le compartiment adjacent. Il y a un risque hypothermie pour le personnel qui doit activer cette valve. Je propose de remplacer cette valve (VS20055) par une valve à ouverture et fermeture à distance et d'ajouter le contrôle dans la page CCAM (contrôle valve bouchain)			Auxiliary Systems	Venturi d'aspiration directe	Yves Arbour	(Guillaume Noel												
Secure AIS for Hero Class program Rhibs	Installation of a Secure AIS System similar to that of the offshore CSP vessels in Atlantic region, that will permit the ship to track the RHIB on AIS, yet remain undetected to any other vessels in the area that may be receiving AIS information			Communications Systems (Comms)	AIS	David Wyse													
Conversion au DEL compartiment de machinerie	Il y a 24 lumières fluorescentes dans les compartiments de machinerie (10 dans le MMR, 8 dans l'AMR, et 6 dans le compartiment d'appareil à gouverner). Ces lumières ne sont pas assez brillantes. Ils ne durent pas due à la vibration ou la chaleur produits dans ces compartiments. (plus particulièrement dans l'appareil à gouverner). En 2015 et 2016 nous avons eu besoin de réparer plusieurs lumières. Les Ballons d'ampoules et les démarreurs brûlent quand les composantes des lumières deviennent moins bien ajusté, la situation actuelle présente un risque d'incendie mineur			Electrical Power Distribution	Éclairage fluorescent	Sheldon Colley	Matthew Stares												
MSPV Alarm Monitoring System replacement	The major components of this critical system have all been designated as mothered. This designation basically means that there is no further OEM support for the software or hardware which will make both technical support and spare part acquisition increasingly more difficult as time progresses. Existing software hacks up from time to time and requires a system reset to bring the monitoring system back online. Failure of this system will impact vessel operations and without OEM support, could lead to extended non operational periods until access and/or technical support can be acquired. This system also implements automation for critical sub systems such as bilge suction valves, engine-room fans and distributed monitoring of fire zones in the event of a fire. The tank level monitoring system requires continuous attention to maintain proper level indication			Integrated Control Systems	Alarm and monitoring system	William Falconer	william.falconer@dnd-mdn.gc.ca	902 440 8231	Approved for prototype	2017-12-07 AIS, CCR Registration, Major Additional CCR Supported by Tech Authority is Routed to CCR Committee to Rec./Support, 2017-12-13, OCR Supported by Committee. 2018-01-18 Appendix D added to OCR, for design and Total including contracting steps. 2018-02-06 OCR Approved for Engineering/Prototype and one installation for Trial. CCR, OPI Vitaly Mokliakov, William Falconer to present Trial Report to CCB to get final Approval before proceeding with installation for Class.

EKME # 5045742v1 **Updated** 2014/03/07 *(a Richardson original author)*

Hero Class depth sounder replacement	During fire drills the Chief Mate is in charge of the Fire Team, the First engineer in charge of Fire Support and the Chief Engineer is in the control room. Currently 4 UHF radios are installed on the vessel which are given to the bridge, Chief Mate, First Engineer and Chief Engineer. The fire team does not have one and they are the ones being sent without radio communications to a space that may be hazardous. The Chief Mate cannot follow due to smoke, heat etc so in reality the situation temporarily the First Engineer/Chief Mate is giving their radio to the fire team.	MSPV	Vessel Communications and Navigation	echo sounder	David Wyse

EKME # 3045742v1 Updated 2014/08/07 *(J. Richardson original author)*

Decca Sound Reception System Replacement	Decca issued Technical Bulletin TB05-2013 on Dec 12, 2013, stating that the Type Approval against Dec 31, 2013 and once the SAS100 does not meet ISO standard 14139:2012. Type Approval will not be re-issued. HO supports the conclusion that there is no way to make the current system usable, and it must be replaced. There are many other makes and models of vessel reception systems on the market, and multiple systems should be analyzed before deciding on a new system. Whichever system is decided on, needs to be thrifted before making a final decision. Recommend that once a new inspector system is chosen, it becomes the new standard.	MSPV	Sound Reception System	Vessel Equipment Aides and Navigation	Norman Poppe		2/13/2014	Approved for Engineering	2017-08-14 Ack. CCR Registration. CCR raised by EE at HCR. Document forwarded to Operation to Plan /Support. 2017-07-19 CCR Supported by Committee, sent to CCB for Approval.	2017-03-01 - System does not work on all vessels. Robertson - this is a condition of class: in 4 months (very) will be another survey and the inspector will look at this. It has to be must forward.	2.4 MAR							
Life Cycle Replacement of VHF Direction Finding Systems	The current Very High Frequency (VHF) Direction Finder (DF) standard is becoming very difficult and expensive to maintain. Parts are in short supply and in some cases no longer available and lead times to execute replacement are typically 7 months minimum. Develops a new National Standard and deploys as the current systems require a service or replacement.	AIR Assets	VHF Direction Finder		Rod Pike		3/27/2013	Approved for Engineering/Prototype	2017-03-10_Ack. CCR Registration. CCR raised by HQ, Components are routed to CCR Committee for Rev / Support. 2017-04-07 approved for engineering - although some do not meet transport requirement, Transport not enforcing with CCG. to rewrite of regulation may require current measurement, Doc to determine Op. requirement.	2017-03-21- Controller Centers has the CURAC brand.	1.5 MAR

EKME # 8045742v1 Updated 2014/03/07 *(L Richardson original author)*

M Charbin M B SAB Silencer	Existing Conditions: The Current 60dB SAB Sil-X_87 Silencer is rated for a reflection of 29-35 dBA. It is most efficient at lower Exhaust Frequency and loses its efficiency very quickly. The current set up is extremely basic, and has escaped a number of noise nonconformity across the country. It would be in the best interest of the client to encourage trains with a higher quality exhaust silencer to reduce the noise over a WIDER range of operating conditions. The current silencers are 42" long and 12" in diameter. Spacemastered Solution, SilenTech, developed through ADF Distributors makes a better model SDUE-36-96-1 4 T that has a noise reduction rating of 29-33DBA but over a much larger range of the generators exhaust frequencies. In the frequency range that the SMS product is most efficient (35dBa reduction) the MinT-Tech Product is actually closer to 45DBA reduction, almost double that of the current Silencer. The SilenTech Product is 70.5" Long and 14" in diameter. There is room in the current installation but the exhaust piping will have to be cut back to accomplish the new length, and additional bracing installed on the deck beam. The increased diameter is negligible. The work could be done by engine crew if confident with welding, but I would suggest hiring a welding company to complete the exhaust modifications as it requires pressure by welding on thin metal. The silencer is a spark arrestor type and meets all requirements of the currently installed ones, including back pressure requirements from the generators. The silencers have a back pressure of less than 25 of the maximum allowable back pressure on the generators at max load. The quoted price from ADF is $ 7,079 per silencer Plus the cost to install. Each silencer weighs 121 pounds, the weight of the current fitted ones is not provided by the manufacturer but could be estimated at 60-80 pounds. Contact for ADF is Brandon Guevara brandon.guevara@adfdistributors.com Anticipated Benefits: Generator exhaust noise should be substantially lower. Reducing issues with noise pollution in the various areas of operation that we work in, it will also reduce the noise level on the aft deck of the vessel creating a better work environment for engine crew Impact on Maintenance Budget: Continued high noise levels	MSPV	Major Success Electrical Generation Systems	Major Service Electrical Power Generation	Core Isolation				2016-07-26 As a CCR Registrant, Scope need to know business line CCR should be applicable to MSPV Class. Subject: Lightship and incline surveys for the Hero Class vessels

Hey Jason,

In light of the ITS/Ops meeting being cancelled today, I am wondering if a meeting is required to start moving forward again with Hero Class CCRs such as the stabilizers and the stern strengthening that might add additional weight to the vessels. Is it possible from operations to give approval over email to begin the process of planning lightship surveys and incline tests for the Hero Class vessels?

Currently the CCRs are on hold with ITS marine engineering due to the fact that we are not confident that the same vessel stability numbers and displacement number as when the vessels first arrived for program. Having a zero point similar to the NSFRVs will help to make future decisions about upcoming CCRs.

Thanks
Dave

Good morning [redacted]

We are trying to work out the current displacement and stability of the vessels to make the right decision about the hydraulics. Hoping to have a plan shortly.

Thanks
Dave

Hi David:

I hope you are well and enjoying the summer.

It's been a few weeks, but I wanted to follow up on the HERO class refit you guys were considering – is the project still moving forward or has it been put on hold?

Sincerely,

s.19(1)

Hi David:

I just left you a VM – I think you are possibly in training, but I wanted to make sure we are still ok for tomorrows meeting at 11:30 at the Minto food court you mentioned previously.

Also I wanted to make sure you received the preliminary drawings and brochures I sent on the 17th?

I look forward to meeting you tomorrow Dave.

Sincerely,

Quantum Marine

Hi

I am the national lifecycle manager for the Hero Class vessels. I would like to meet you but unfortunately I am in training that whole week of May 31st. Can we meet at a lunch hour around 1130 to 1 one day at the Minto food court on Kent and Laurier streets on a day during that week? Tuesday the 29th doesn't work for me.

I would like to discuss the quantum model that best suits our Hero Class vessels and our weight and hydraulic issues.

I will get back to you on which model that was.

Thanks
Dave

Subject: RE: Telephone Message

Hi Gerry:

Yes that was my VM – sorry I missed you.

I just left another – basically we have been contacted by some of your colleagues over in Vancouver about TANU and the HERO class regarding stabilizer supply and support.

Since I will be in your area for CANSAC, I thought it might be of value to your technical dept., if I drop by and discuss some of the newer technologies we are now using for Zero Speed and low speed (loitering) for your ships.

Also since the request for the HERO class feasibility (through Langkreek out in Newfoundland and DAMEN [redacted], that it may help with any questions about the potential use of stabilizers – if in fact the CCG does refit them.

Would you be available for a short chat?

Dear Mr. Wyse,

Please find enclosed the signed contract + bank details that had been sent separately. We understood that the signed contract was considered as a PO and thus would function as an invoice.

The original contract concerned EUR 14.740 and the amendment concerned EUR 660, so total would be EUR 15.400.

Kind regards,

From: DeVink, Jean-Pierre
Sent: 11 juillet 2017 14:24
To: [redacted]
Subject: RE: DFO contract F5211-170139 - Hero Class Seakeeping assessment

Hi [redacted]

Below you will find the described am trying to finalize the contract and wanted to confirm with you that the following paragraph was the only modification we required?

A.3 Scope

CCG requires that the Contractor produce a new seakeeping assessment of several roll stabilization configurations on the Hero Class. The Contractor must produce a seakeeping assessment of the vessels as delivered with no stabilization and the following configurations:

- *Active fin (roll) stabilization,*
- *Rudder roll stabilization*
- *Bilge keels,*
- *Rudder roll stabilization plus bilge keels,*
- *'Zero Speed' stabilizers. P or XT Series (Quantum: www.quantumhydraulic.com)*

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Then the Contractor must analyze and compare the un-stabilized vessel against the five/six configurations.

Also, I have attached a copy of the contract document with the above revision.

Please ensure that this copy is executed on behalf of the Contractor by their duly authorised officers / agents or other person(s) legally authorised to bind the party and returned to the undersigned by email at your earliest convenience.

Please ensure the signatory signs and a scanned copy is provided at your earliest convenience.

Upon receipt and after execution on behalf of the minister, a copy will be forwarded to you for your retention.

Thank you,

Jean-Pierre deVink

From:
Sent: 7 juillet 2017 11:25
To: Kozarski, Vladan; DeVink, Jean-Pierre
Subject: RE: DFO contract F5211-170139 - Hero Class Seakeeping assessment

Hi Vladan,

Sorry about the delays on our side. I would like to inform you about the following:

The sales director agreed with the contract and had no further remarks. The remark I made earlier about the "P or XT series" would then be the only change in the contract.

However, I ran into an issue. I started the base analysis (no stabilizers) and found out that the wave spreading function is not working in the tool. I've been in contact a lot with the tool manufacturers this week and they created a workaround for me. However, the workaround is still not working properly. The spreading is not included in head waves and there are issues with zero encounter frequencies, leading to very large responses.

At this moment we have 3 options, as I see it:

1. Hold off on signing the contract until I have figured this out completely
2. Do not take wave spreading into account anymore. This has only a negligible effect on the assessment of the effectiveness of the different roll stabilizers, as the spreading would affect all solutions more or less equally. The RAOs are completely independent of spreading anyway. There is also no effect on the budget, as spreading was supposed to be fully automatic, so excluding it does not lead to time savings.
3. Put in the contract some hybrid form, where wave spreading excluded is acceptable, but spreading included is preferable. In that case I will both start the calculations and continue to solve this in time if we can.

I apologize for this inconvenience and look forward to your views on this.

Enjoy the weekend!

Best regards,

Subject: RE: DFO contract F5211-170139 - Hero Class Seakeeping assessment

[redacted] and Jean-Pierre,

I do agree with the change. Damen will analyze only one 'Zero Speed' stabilizer, so it should be P or XT series. Although we decided to go with the P series only, I would keep **P or XT Series** in the recommended text:

'Zero Speed' stabilizers. P **or** XT Series (Quantum: www.quantumhydraulic.com).

Hope this clears out the contract wording.

Regards.

Vladan.

Subject: RE: DFO contract F5211-170139 - Hero Class Seakeeping assessment

Hi Jean-Pierre,

Thanks for the contract. I've looked it over and noticed just 1 last detail: on page 7 it mentions 'Zero Speed' stabilizers. P and XT Series (Quantum: www.quantumhydraulic.com)

But this should be
'Zero Speed' stabilizers. P **or** XT Series (Quantum: www.quantumhydraulic.com)

Vladan has already indicated that this will be the P-series.

If you and Vladan agree, could you send a revised contract? I will forward this version to the right people so they can have a look already.

Best regards,

E-mail address: Vladan.kozarski@dfo-mpo.gc.ca

The Project Authority is the representative of the department or agency for whom the Work is being carried out under the Contract and is responsible for all matters concerning the technical content of the Work under the Contract. Technical matters may be discussed with the Project Authority, however the Project Authority has no authority to authorize changes to the scope of the Work. Changes to the scope of the Work can only be made through a contract amendment issued by the Contracting Authority.

6.5.3 Contractor's Representative

s.19(1)

Name: [redacted]
Organization: Damen Shipyards
Address: P.O. Box 1
4200 AA Gorinchem
The Netherlands
Telephone: [redacted]
Facsimile: +31 183 65 54 74
E-mail address: [redacted]

6.6 Proactive Disclosure of Contracts with Former Public Servants

By providing information on its status, with respect to being a former public servant in receipt of a *Public Service Superannuation Act* (PSSA) pension, the Contractor has agreed that this information will be reported on departmental websites as part of the published proactive disclosure reports, in accordance with Contracting Policy Notice: 2012-2 of the Treasury Board Secretariat of Canada.

6.7 Payment

6.7.1 Basis of Payment

6.7.1.1 The Contractor will be reimbursed for the costs reasonably and properly incurred in the performance of the Work, as determined in accordance with the Basis of Payment in Annex "B", to a limitation of expenditure of $14,740.00 (EUR). Customs duties are included and Applicable Taxes are extra.

6.7.1.2 All prices and amounts of money in the Contract are exclusive of the Goods and Services Tax (GST) or Harmonized Sales Tax (HST), whichever is applicable, unless

2

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

otherwise indicated. GST or HST, to the extent applicable, will be incorporated into all invoices and progress claims for goods supplied or work performed and will be paid by Her Majesty. The Contractor agrees to remit to Canada Revenue Agency any GST or HST paid or due.

6.7.1.3 Any payment by Her Majesty under this contract is subject to there being an appropriation for the fiscal year in which the payment is to be made.

6.7.2 Limitation of Expenditure

SACC Manual clause C6001C (2013-04-25), Limitation of Expenditure

6.7.2 Multiple Payments

SACC Manual clause H1001C (2008-05-12), Multiple Payments

6.8 Invoicing Instructions

6.8.1 Payments will be made provided that:

6.8.1.1 The invoice(s) must be emailed to DFO Accounts Payable, at the email address indicated below:

Email: DFOinvoicing-MPOfacturation@DFO-MPO.GC.CA

The Contractor must submit invoices in accordance with the section entitled "Invoice Submission" of the general conditions. Invoices cannot be submitted until all work identified in the invoice is completed.

The original and one (1) copy must be forwarded to the address shown above and on page 1 of the Contract for certification and payment.

6.9 Certifications

6.9.1 Compliance

The continuous compliance with the certifications provided by the Contractor in its bid and the ongoing cooperation in providing associated information are conditions of the Contract. Certifications are subject to verification by Canada during the entire period of the Contract. If the Contractor does not comply with any certification, fails to provide the associated information, or if it is determined that any certification made by the Contractor in its bid is untrue, whether made knowingly or unknowingly, Canada has the right, pursuant to the default provision of the Contract, to terminate the Contract for default.

6.10 Applicable Laws

The Contract must be interpreted and governed, and the relations between the parties determined, by the laws in force in **the province or territory where the goods and/or services are to be rendered**.

2

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

6.11 Priority of Documents

If there is a discrepancy between the wording of any documents that appear on the list, the wording of the document that first appears on the list has priority over the wording of any document that subsequently appears on the list.

(a) the Articles of Agreement;
(b) the general conditions 2010B **2015-07-03**, General Conditions - Professional Services
(c) Annex A, Statement of Work;
(d) Annex B, Basis of Payment;
(e) Annex C, Security Requirements Check List;
(f) the Contractor's bid dated June 1st 2017.

6.12 Procurement Ombudsman

6.12.1 The Contractor confirms that it has read the Code of Conduct for Procurement and agrees to be bound by its terms.

6.12.2 The office of the Procurement Ombudsman (OPO) was established by the Government of Canada to provide an independent avenue for suppliers to raise complaints regarding the award of contracts under $25,000.00 for Goods and under $100,000.00 for Services. You have the option of raising issues or concerns regarding the solicitation, or the award resulting from it,. With the OPO by contacting them by telephone at 1-866-734-5169 or by e-mail at opo-boa@opo-boa.gc.ca. You can also obtain more information on OPO services available to you on their website at www.opo-boa.gc.ca.

6.12.3 For further information, the Contractor may refer to the following PWGSC site:

http://www.tpsgc-pwgsc.gc.ca/app-acq/cndt-cndct/contexte-context-eng.html

6.13 Insurance G1005C (2016-01-28)

The Contractor is responsible for deciding if insurance coverage is necessary to fulfill its obligation under the Contract and to ensure compliance with any applicable law. Any insurance acquired or maintained by the Contractor is at its own expense and for its own benefit and protection. It does not release the Contractor from or reduce its liability under the Contract.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

ANNEX "A" STATEMENT OF WORK

A.1 Background

A.1.1 Vessel Info

Canadian Coast Guard (CCG) took acceptance of nine new Hero Class Vessels built by Irving Shipyards between 2012 and 2014 under "Lloyd's Rules and Regulations for the Classification of Special Service Craft, 2009".

Ships Particulars	
Length	42.8 m
Breadth	7.0 m
Draft	2.218 m
Freeboard	1.7 m
Gross Tonnage	253.0 t
Cruising Range	200 nm
Endurance	14 d
Cruising Speed	14.0 kts
Maximum Speed	25.0 kts

Class Notations:
Hull Notation: *+100A1 SSC PATROL, MONO, HSC, G4, EP.*
Descriptive Notes: *ABBREVIATED NOTE GREEN PASSPORT*

The Hero Class vessels operate in different environments. Five vessels of the Marine Surveillance (MS) variant operate in the Great Lakes and St. Lawrence River in predominantly fresh and brackish water. Two vessels of the Conservation and Protection (CP) variant operate in the North Pacific, and two others operate in the North Atlantic. All four ships in this variant sail within the cruising range of up to 200 nautical miles (370 km) from the coast at a maximum speed of 25 knots (46 km/h).

Each MS vessel carries two rigid-hulled inflatable boats (RHIBs) while each CP vessel carries one RHIB. The vessels have a single point davit launching arrangement for launching the RHIBs. Each vessel has accommodation for nine CCG personnel as well as up to five Department of Fisheries and Oceans or RCMP officers.

The Hero Class is a variant of the Damen 4207 particularized for service with CCG, and retains the same basic hull design of the parent vessel. As such, the Hero Class shares similar seakeeping characteristics as the parent 4207. However, the Hero Class vessels do not have fin roll stabilizers. The majority, but not all, of the international variants based on the 4207 parent hull are equipped with fin roll stabilizers.

CCG is looking to improve seakeeping performance of the Hero Class vessels. There are several applicable solutions on the market. However there are many restrictions for the application of stabilizers on the Hero Class that may stipulate some solutions rather than others. CCG is looking for the configuration that provides the best compromise between improved seakeeping performance on one side and increased lightship weight, reduced internal space and installation cost on the other side.

A.1.2 Existing Seakeeping Assessment

A seakeeping assessment of the Hero Class was conducted during the vessels' design phase by Damen Group and the report was delivered to Canadian Coast Guard. The report as well the analysis, conclusions and other details of the assessment are given in the [Ref. A].

A.2 Scope

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

CCG requires that the Contractor produce a new seakeeping assessment of several roll stabilization configurations on the Hero Class. The Contractor must produce a seakeeping assessment of the vessels as delivered with no stabilization and the following configurations:

- Active fin (roll) stabilization,
- Rudder roll stabilization
- Bilge keels,
- Rudder roll stabilization plus bilge keels,
- 'Zero Speed' stabilizers. P or XT Series (Quantum: www.quantumhydraulic.com)

Then the Contractor must analyze and compare the un-stabilized vessel against the five/six configurations.

A.2.1 Vessel Modeling

The seakeeping of the vessel at the following five locations must be assessed:

1. Bridge (accelerations) [m]: 20.92; 0.93; 7.2
2. RHIB Launching (accelerations) [m]: 5; 3.5; 3.9
3. Deck at 0.9L (deck wetness) [m]: 38.5; 1.75; 5.72 (or 4.54)
4. Forefoot (slamming) [m]: 38.5; 0 ; 0,
5. Center of Gravity

Coordinates are given in the following order: longitudinal, transversal and vertical.

Axes of the coordinate system are:

- Longitudinal axis is in the vessel's centerline plane and pointing positive towards bow,
- Transversal axis is in the frame 0 plane and pointing positive towards starboard side,
- Transversal axis is in the baseline plane and pointing positive upwards.

Origin of the coordinate system is located at the frame 0, Baseline and Centerline plane

Vertical coordinate of deck wetness location could be taken at the deck side or bulwark [Ref. C & D]. The Contractor must advise CCG on what location will be better to apply and take the most appropriate one.

Vessel radii of gyration (roll, pitch and yaw) must be taken as per values recommended in the [Ref. F].

The following motions, accelerations and probabilities must be assessed.

- Vertical and lateral accelerations at the locations 1, 2, 3 and 5,
- Roll and pitch motions,
- Probability of deck wetness (green water shipping) for the location 3,
- Probability of slamming must be assessed for the location 4.

This makes total of twelve variables to be analyzed.

The seakeeping assessment must be done for the following loading condition [Ref.B]:

- Departure:
  - Displacement: 264 tonnes,
  - Mean draft: 2.197m (draft @ 20.5m in salt water),
  - Trim by stern: 0.077m (per 36.7m length between draft marks in salt water),
  - Mean draft: 2.228m (draft @ 20.5m in fresh water),
  - Trim by stern: 0.076m (per 36.7m length between draft marks fresh water),

2

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

LCG: 16.709m,
TCG: 0,
VCG: 2.912m.

Hull appendages: rudders and shafts must be modeled.

Vessel speed range must be from zero to 25 knots in 5 knots step (total of six speeds).

A.2.3 Enviromental modeling and conditions.

The definition of wave direction in respect to vessel's heading must be as follows:

1. 0 degrees angle between waves' direction and vessel's heading are stern or following waves,
2. 90 degrees angle between waves' direction and vessel's heading are beam waves,
3. 180 degrees angle between waves' direction and vessel's heading are head waves.

The waves on the seaway must be modeled to represent as close as possible the sea environment and waves in which the vessels operate.

The seaway must be modelled using the following assumptions:

1. Bretschneider spectrum for North Atlantic and Pacific,
2. JONSWAP spectrum for Great Lakes area,
3. A uni-directional wave spectrum must be modelled using a point wave spectrum (Bretschneider, JONSWAP, ...).
4. The mean significant wave height and most probable peak period for sea states 5 and 6 statistics [Ref. F] must be applied for spectra modeling in North Atlantic and Pacific as well as Great Lakes,
5. Deep water.

Sea states 5 and 6 for North Atlantic and Pacific as well as appropriate states for Great Lakes must be applied.

A.2.4 Seakeeping Assessment Results

The contractor must deliver the seakeeping assessment results of all proposed stabilizers as raw data and as polar and RAO plots.
Raw data must be delivered for all twelve variables as required in A.3.1 in the Departure condition as well as in all waves' directions, all ship speeds and sea states.
Plots must be delivered in the two formats for selected motions, accelerations and probabilities in the Departure loading condition and environmental conditions as required in A.3.3. The required formats are:

- Polar plots for 360 degrees wave direction and all ship speeds. Polar plots must be delivered for the following variables:
  - Vertical and lateral accelerations at the locations 1 and 5,
  - Roll and pitch motions,
  - Probability of deck wetness (green water shipping) for the location 3.

  RMS values for the motions and accelerations must be used.

- Response Amplitude Operators (RAO) plots for 180 degrees wave direction, all six speeds and for roll motion only; each plot must show and compare curves of un-stabilized vessel against all stabilizing configurations.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

The Contractor must also add applicable seakeeping criteria as defined by NORDFORSK 1987 [Ref. F] to the plots. In addition, the Contractor must assess motion sickness against ISO 2634-1:1997 for the locations: 1 – Bridge, 2 - RHIB launching and 5 - Centre of Gravity.

The results of the seakeeping analysis must be presented in such way to provide enough information that the stabilizers can be compared by roll reduction efficiency. This seakeeping assessment will be used as an input for the comparative analysis and feasibility study of the stabilizers' implementation on the Hero Class. In that study several features of the stabilizers will be compared and one of them will be their ability and efficiency to reduce the roll motion.

A.3 Tasks

The following tasks are required to be completed but may be undertaken in any order the Contractor chooses:

- Carry out seakeeping assessment with vessel particulars, loading and environmental conditions as provided in the scope,
- Provide the results and analysis of the assessment,
- Review of expected roll reduction at different speeds and show the results in a comparative form,
- Review of effect on speed and range performance,
- Produce a report of all findings.

A.4 Deliverables

All deliverables shall be in an unprotected format to allow CCG full editing rights into the future.

Final report shall be delivered to CCG as one hard copy and a soft copy. Preferred report formats are Microsoft Word Document (.docx), AutoCAD (.dwg) and Adobe Acrobat (.pdf).

A soft copy shall include report both in Adobe Acrobat and Microsoft Word format as well as all source files used to create report (Excel tables, AutoCAD drawings, photos ...).

Drafts of Microsoft Word documents and drawings to be reviewed by CCG can be delivered by e-mail, or prepared for download from remote servers or web drives (such as FTP, OneDrive, Google Drive, etc.)

A.5 Schedule

Draft report of the seakeeping assessment, must be delivered to the project officer for review within the six weeks after the project initiation.

CCG must review the draft of the study and provide comments to the Contractor within two weeks of the receipt.

The final report of the seakeeping assessment must be delivered to the project officer within three weeks after receiving comments for the draft.

Additional meetings to discuss any issues can be organized at the request of either the Contractor or CCG on an ad hoc basis as the need arises.

If in any case the Contractor is not able to complete and submit the work by required deadline, an extension of up to three weeks may be granted.

Anticipated starting date is August 7th 2017. Anticipated date of the final report submission is October 27th 2017.

A.6 Applicable Documents

Ship drawings and reports (seakeeping report, stability books) available upon request.

2

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4. Brief Description of Work / Brève description du travail:
ITS CCG would like to award a contract to Damen through DFO Lorette Bay. CCG Hero Class vessels were built in Canada and used Damen Patent design for the hull as the original design. Canadian vessels were delivered without modifications. After a few years of service, CCG considers installation of the stabilizers and would like to get a comparative analysis of the two available systems on the market. Damen was chosen for this work as the owner of the original design and for their knowledge and the experience with the various roll stabilizers.

Hi [redacted]

I have attached the new vendor form to obtain billing information to set up payment.
I did my best to fill out all the sections I had information to input, we are missing the "tax code information and direct deposit information".
As you are an international company, I don't believe we require any tax code information, however if you do have this information, please fill it in.

Thank you,

Jean-Pierre deVink

Subject: RE: DFO contract F5211-170139 - Hero Class Seakeeping assessment

Hi [redacted]

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Below you will find the described am trying to finalize the contract and wanted to confirm with you that the following paragraph was the only modification we required?

A.3 Scope

CCG requires that the Contractor produce a new seakeeping assessment of several roll stabilization configurations on the Hero Class. The Contractor must produce a seakeeping assessment of the vessels as delivered with no stabilization and the following configurations:

- *Active fin (roll) stabilization,*
- *Rudder roll stabilization*
- *Bilge keels,*
- *Rudder roll stabilization plus bilge keels,*
- *'Zero Speed' stabilizers. P or XT Series (Quantum: www.quantumhydraulic.com)*

Then the Contractor must analyze and compare the un-stabilized vessel against the five/six configurations.

Also, I have attached a copy of the contract document with the above revision.

Please ensure that this copy is executed on behalf of the Contractor by their duly authorised officers / agents or other person(s) legally authorised to bind the party and returned to the undersigned by email at your earliest convenience.

Please ensure the signatory signs and a scanned copy is provided at your earliest convenience.

Upon receipt and after execution on behalf of the minister, a copy will be forwarded to you for your retention.

Thank you,

Jean-Pierre deVink **s.19(1)**

Sent: 7 juillet 2017 11:25
To: Kozarski, Vladan; DeVink, Jean-Pierre
Subject: RE: DFO contract F5211-170139 - Hero Class Seakeeping assessment

Hi Vladan,

Sorry about the delays on our side. I would like to inform you about the following:

The sales director agreed with the contract and had no further remarks. The remark I made earlier about the "P or XT series" would then be the only change in the contract.

However, I ran into an issue. I started the base analysis (no stabilizers) and found out that the wave spreading function is not working in the tool. I've been in contact a lot with the tool manufacturers [redacted] this week and they created a workaround for me. However, the workaround is still not working properly. The spreading is not included in head waves and there are issues with zero encounter frequencies, leading to very large responses.

At this moment we have 3 options, as I see it:

1. Hold off on signing the contract until I have figured this out completely [redacted]
2. Do not take wave spreading into account anymore. This has only a negligible effect on the assessment of the effectiveness of the different roll stabilizers, as the spreading would affect all solutions more or less equally. The RAOs are completely independent of spreading anyway. There is also no effect on the budget, as spreading was supposed to be fully automatic, so excluding it does not lead to time savings.
3. Put in the contract some hybrid form, where wave spreading excluded is acceptable, but spreading included is preferable. In that case I will both start the calculations and continue [redacted] to solve this in time if we can.

I apologize for this inconvenience and look forward to your views on this.

Enjoy the weekend!

Best regards,
[redacted]

Subject: RE: DFO contract F5211-170139 - Hero Class Seakeeping assessment

[redacted] and Jean-Pierre,

I do agree with the change. Damen will analyze only one 'Zero Speed' stabilizer, so it should be P or XT series. Although we decided to go with the P series only, I would keep **P or XT Series** in the recommended text:

'Zero Speed' stabilizers. P **or** XT Series (Quantum: www.quantumhydraulic.com).

Hope this clears out the contract wording.

Regards.

Vladan.

Subject: RE: DFO contract F5211-170139 - Hero Class Seakeeping assessment

Hi Jean-Pierre,

Thanks for the contract. I've looked it over and noticed just 1 last detail: on page 7 it mentions
'Zero Speed' stabilizers. P and XT Series (Quantum: www.quantumhydraulic.com)

But this should be
'Zero Speed' stabilizers. P **or** XT Series (Quantum: www.quantumhydraulic.com)

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Vladan has already indicated that this will be the P-series.

If you and Vladan agree, could you send a revised contract? I will forward this version to the right people so they can have a look already.

Best regards,

MSPV Seakeeping Assessment and Roll Stabilizers Comparative Analysis

Canada

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Overview

- Introduction
- Seakeeping – Roll Stabilization
- Stabilizers
- Pro's and Con's and Comparison
- Existing Seakeeping analysis and Effectiveness of Roll Stabilizing Systems

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Introduction

- CCG took acceptance of nine new Hero Class Vessels built by Irving Shipyards between 2012 and 2014 under Lloyd's Special Service Craft Rules 2009.

- The Hero Class is a variant of Damen 4207 particularized for service with CCG.

- Other Administration such as USCG, Mexico Navy, and a number of Caribbean countries have in service patrol boats designed and built as a variant of Damen 4207.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Introduction

- The issue of sea kindliness of the Hero Class vessels has been raised through discussions with Regional personnel.
- According to crew experience, Hero Class vessel experience excessive roll motions in Atlantic, Pacific and Great Lakes regions.
- Hero Class vessels are not fitted with any type of roll stabilization systems.
- The majority, but not all, of the international variants based on Damen 4207 parent hull are equipped with fin roll stabilizers.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Introduction

- CCG is looking to improve seakeeping performance of the Hero Class vessels.

- A new seakeeping assessment and comparative analysis shall be conducted to consider several different roll stabilization configurations.

- There is a number of constrains that should be regarded in the application of roll stabilization systems:
  - Effectiveness of the stabilization system (roll reduction),
  - Weight,
  - Available space for the installation ,
  - Cost ,
  - Power requirements.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Roll Reduction of Ship Motions

- Methods of motion reduction are often known by the generic name of motion "stabilization" - incorrect word to use!

- The oscillatory motions of all practical conventional ship designs are already "stable" i.e. they return to an equilibrium datum level after some small disturbance.

- Motion stabilization in terms of seakeeping indicates the reduction in motion which can be achieved by:
  - Increase the dumping,
  - Increase the inertia,
  - Reduce the exciting moment.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information

Vessel Stability v.s. Roll Stabilization

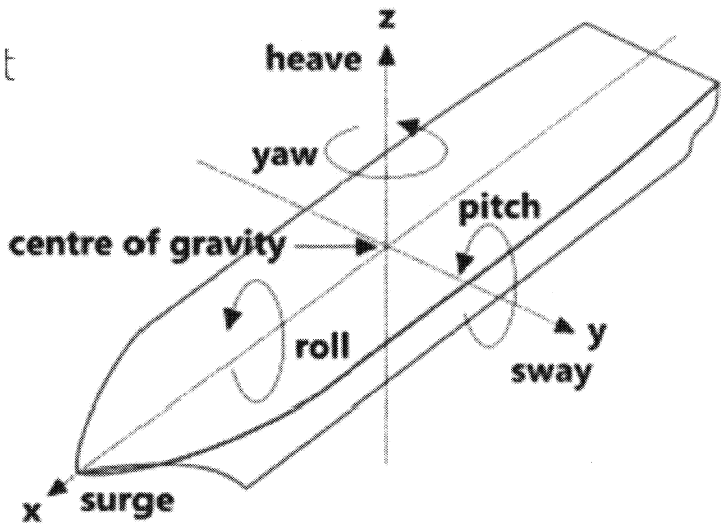
Roll Motion

A ship motion can be described with six degrees of freedom i.e. three translations and three rotations:

X axis – Surge and Roll

Y axis – Sway and Pitch

Z axis – Heave and Yaw



Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Seakeeping – Roll Stabilisation

Effects of Roll Motion on Ship Performance

- Operability - transversal acceleration due to roll induce interruptions in the task performed by the crew.
- Seasickness – vertical accelerations induced by roll at locations away from the ship's centerline and in bow quartering waves.
- Injury due to roll accelerations.
- Large roll angles limit the capability to handle equipment on board.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Stabilizers

- **Roll stabilizing systems to be analyzed in the study:**
  - Active fin (roll) stabilization,
  - Rudder roll stabilization,
  - Bilge keels,
  - Rudder-roll stabilization plus bilge keels,
  - Gyro,
  - Trim tabs.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Stabilizer Systems

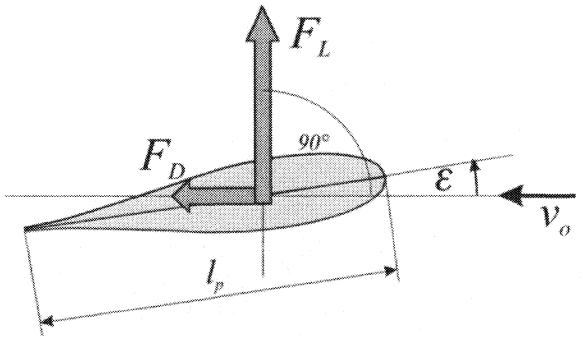
Active fin (roll) stabilization

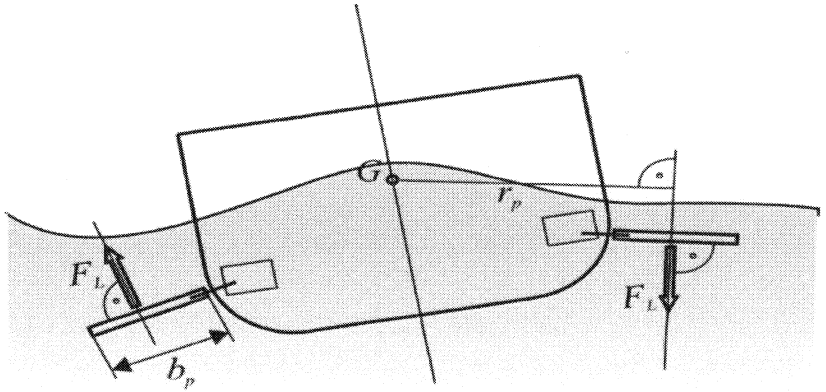
- a pair of hydrofoils mounted on rotatable stocks at the turn of the bilge located about amidships.
- As the ship rolls, this motion is sensed via gyroscopes and fed back to the control system, which commands the actuator to modify the angle of incidence of the fins.
- Once there is an angle between the flow and the fin, hydrodynamic lift is generated, and a stabilizing moment is obtained as a result of the generated lift and the location of the fins on the hull.
- As in any lifting device, the amount of lift, and hence the generated moment, depend on the vessel speed.
- Two types considered: retractable an non-retractable.
- Not efficient at zero and low speed.

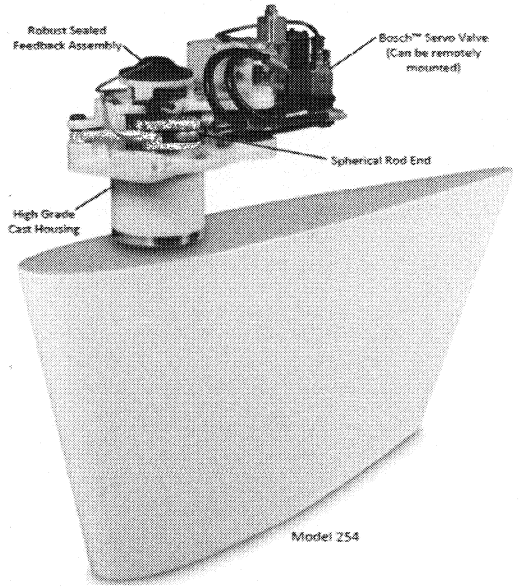
Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

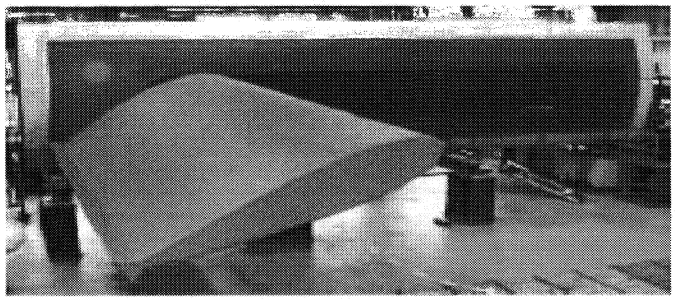
Stabilizer Systems

- **High performance: normally estimated in the range of 60-90% of roll reduction (RMS)**









Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Stabilizers

Rudder Roll Stabilization (RRS)

- Rudder roll stabilization is a technique based on the fact that the rudder is located aft and also below the center of gravity of the vessel, and thus the rudder imparts not only yaw but also roll moment

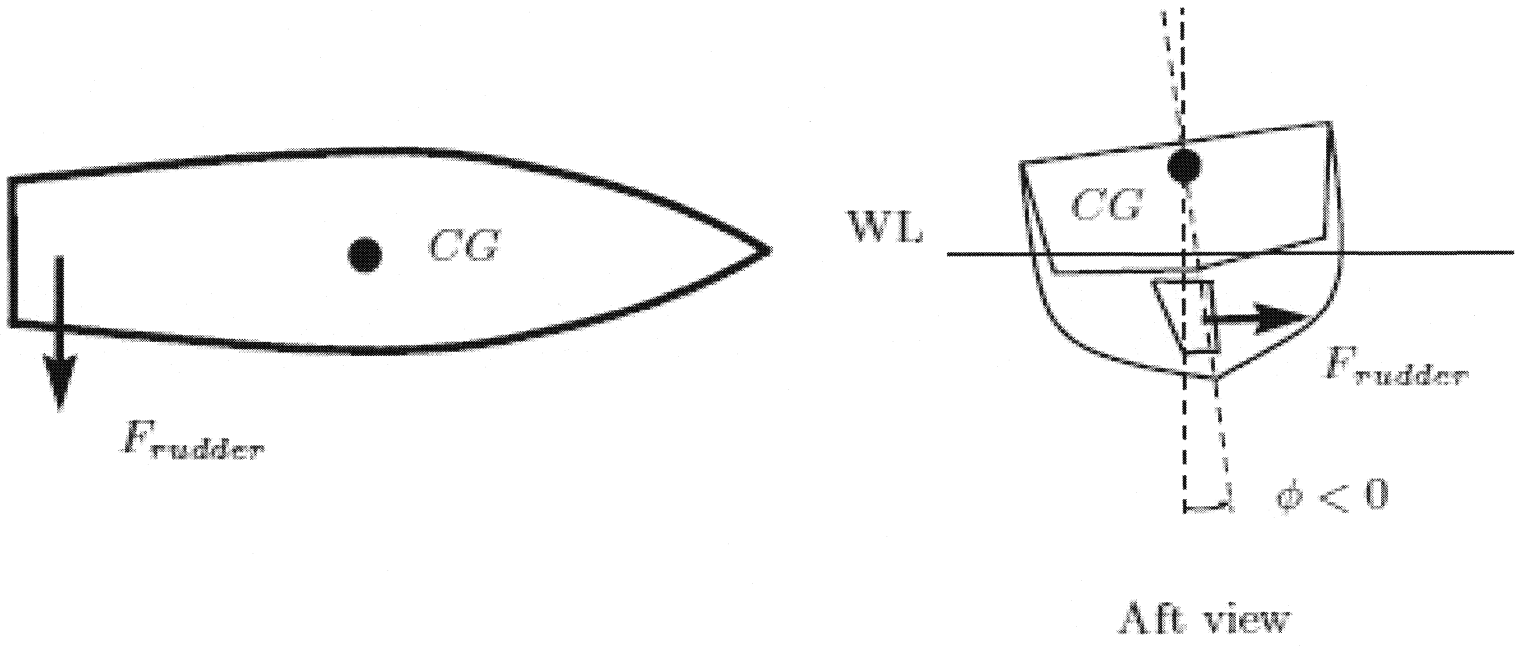
- Most of the drawbacks of conventional active fin stabilizers and anti-roll tanks are overcome by RRS. Provided the speed of the ship and the rudder rate are sufficiently high, this technique can be applied to different ship types:
  - small and large naval vessels,
  - patrol (coastguard) vessels,
  - ferries and some,
  - Ro-Ro vessels .

- Not efficient at zero and low speed, need responsive steering gear, and to be closer to CG.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Stabilizers

Medium to high performance – range of 50-75% of roll reduction (RMS)

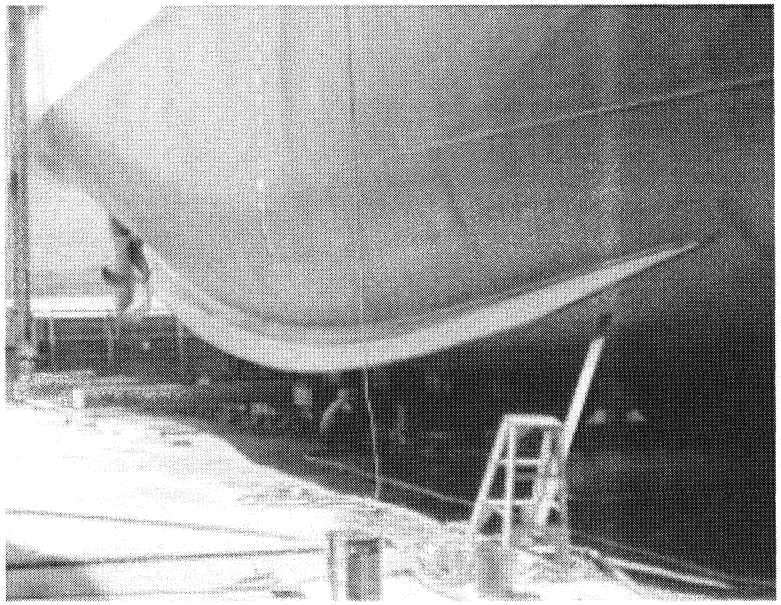


Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Stabilizer Systems

Bilge keels

- The simplest form of roll stabilization device - long narrow keels mounted at the turn of the bilge.
- They work by generating drag forces that acts perpendicular to the keel which oppose the rolling motion of the ship.
- The performance is in the range of 10-20% of roll angle reduction(RMS).
- Effective at zero and low speeds.
- Create extra resistance as a hull appendage.

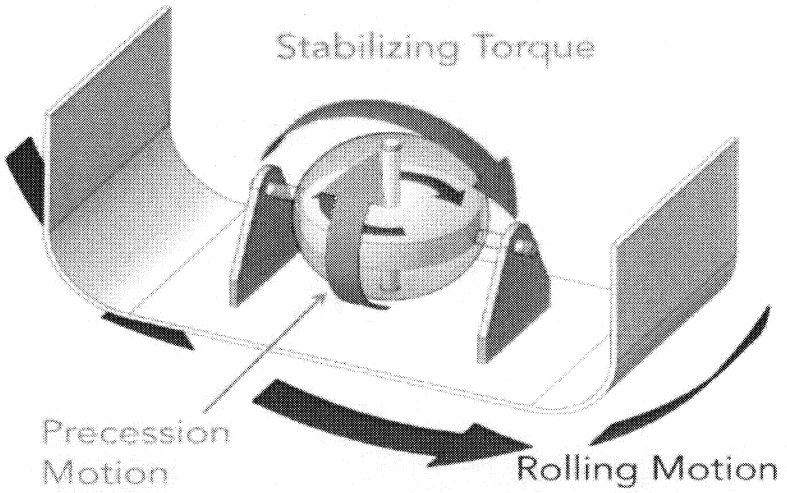


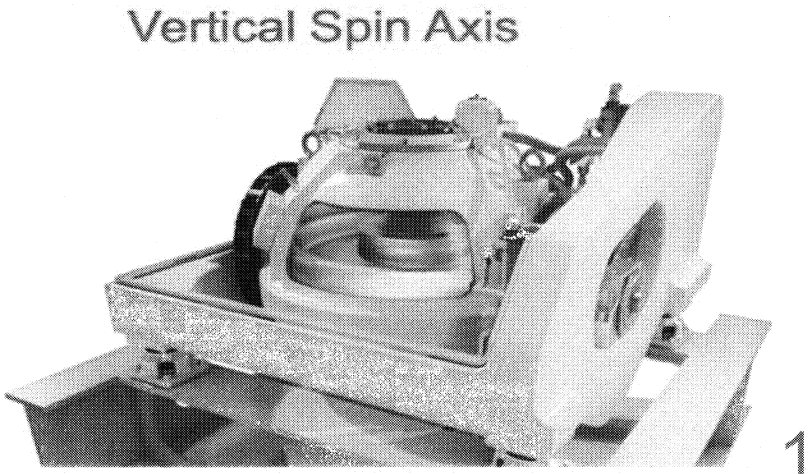
Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Stabilizers

Gyro

- A large spinning mass.
- Produces a righting moment by resisting movement of a rotating mass.
- Size of mass and rotational speed affects amount of righting moment.
- Effect decreases with increasing forward speed.
- Works while cruising (moderate speed) or at anchor.



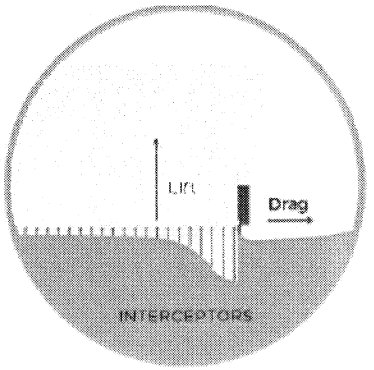


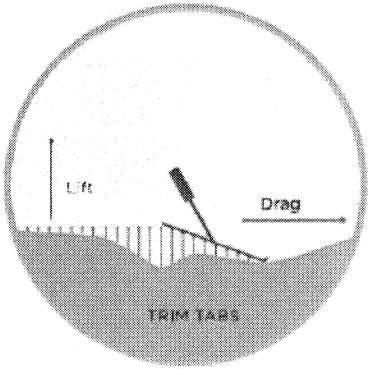
Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

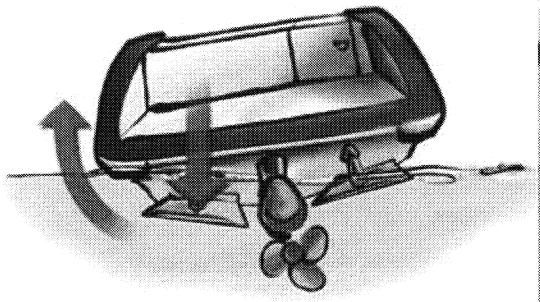
Stabilizers

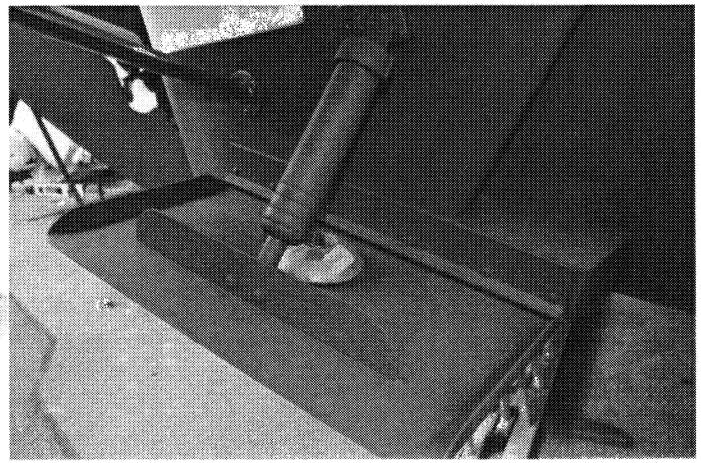
Trim Tabs

- Small surfaces connected to the trailing edge of a larger control surface on a boat.
- Counteracts hydro-dynamic forces and stabilize the boat.
- Effective at medium and higher speeds.
- Small pitch reduction at medium speeds, also can fix trim.
- Resistance reduction?









Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Pro's and Con's and Comparison

Stabilizer Systems	Weight	Space	Maintenance	Resistance	Underway Stabilization	Low Speed Stabilization	Power Req's	Cost
Active Fin (roll) Stabilization	medium, non-retractable are lighter, require less internal space.	Retractable fins may require large space	High. In addition easily damaged and with high risk of grounding when operating in shallow water	Increased resistance in calm water if they are non-retractable. A rough estimate of speed loss due to fin activity is 10%	At speeds higher than 10-15 knots it is the most effective stabilizer. 60 – 90%	Ineffective at low speed.	High – needs control system with sensors and powerful hydraulic actuator	High - Retractabl fins are more expensive
Rudder Roll Stabilization (RRS)	No significant increase in the lightship?	No large space required.	Medium - High. Steering gear??	No resistance?	Effective at medium to higher speeds. 50 – 75 %	ineffective at low speeds	Existing. May need steering gear upgrade.	Relatively inexpensiv ??
Bilge keels	No significant increase in lightship	No occupied space.	Low maintenance – no more than normally done to hull	Increase in hull resistance in calm water condition	Yes. 10 – 20%	Relatively effective source of damping at low speed	No. Simplest form of all stabilizers	Low price and easy installatior
Gyro	High	High.	Low??	No?	Yes.	Yes.	High?	Medium t high.
Trim tabs	Medium?	No. Ship size restrictions?	Low??	Improve?	Yes. Not effective as active fins or RRS.	No stabilization at zero speed	Medium to high.	Medium?

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information

Existing Seakeeping Analysis

Existing Seakeeping Analysis:

- The following parameters were assessed: significant amplitudes of the vertical and lateral accelerations at the Bridge and RHIB location, significant amplitudes of roll and pitch motions as well as probabilities of green water shipping (deck wetness) at Deck @0.9L and probabilities of slamming at Forefoot.

- Two loading conditions: Departure and Arrival.

- Sea states 5 and 6 on north Atlantic and Pacific and Class I and II on Great Lakes. Wave spreading is assumed ± 35 deg. from main wave direction.

- Range of speeds was taken from 0 to 25knots with the increment of 2.5knots.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Seakeeping Criteria:

General Operability Limiting Criteria for Ships (NORDFORSK, 1987)			
Description	Merchant Ships	Navy Vessels	Fast Small Craft
RMS of vertical acceleration at FP	0.275 g ($L \leq$ 100 m) 0.050 g ($L \geq$ 330 m)	0.275 g	0.65 g
RMS of vertical acceleration at Bridge	0.15 g	0.20 g	0.275 g
RMS of lateral acceleration at Bridge	0.12 g	0.10 g	0.10 g
RMS of Roll	6.0 deg	4.0 deg	4.0 deg
Probability of Slamming	0.03 ($L \leq$ 100 m) 0.01 ($L \geq$ 300 m)	0.03	0.03
Probability of Deck Wetness	0.05	0.05	0.05

Criteria for Accelerations and Roll (NORDFORSK, 1987)			
Description	RMS Vertical Acceleration	RMS Lateral Acceleration	RMS Roll Motion
Light Manual Work	0.20 g	0.10 g	6.0°
Heavy Manual Work	0.15 g	0.07 g	4.0°
Intellectual Work	0.10 g	0.05 g	3.0°
Transit Passengers	0.05 g	0.04 g	2.5°
Cruise Liner	0.02 g	0.03 g	2.0°

Surveyor to Lloyd's Register North America, Inc.

Lloyd's Register

A member of the Lloyd's Register Group

Note:
1. To establish the classification status of this ship, the ClassDirect Live web site and the Interim Certificates issued on completion of classification surveys should be consulted in addition to this certificate. Access to ClassDirect Live is available via http://www.cdlive.lr.org.
2. Where an operational envelope is assigned, it will be attached as an appendix to this certificate.

Lloyd's Register, its affiliates and subsidiaries and their respective officers, employees or agents are, individually and collectively, referred to in this clause as the 'Lloyd's Register Group'. The Lloyd's Register Group assumes no responsibility and shall not be liable to any person for any loss, damage or expense caused by reliance on the information or advice in this document or howsoever provided, unless that person has signed a contract with the relevant Lloyd's Register Group entity for the provision of this information or advice and in that case any responsibility or liability is exclusively on the terms and conditions set out in that contract.

Notes

1. In accordance with the Rules and Regulations for the Classification of Special Service Craft, class will be automatically suspended and this certificate becomes invalid if not endorsed annually within three months of the due date of the Annual or Intermediate Surveys.
2. This certificate expires on the due date of the Special Survey. Consideration can be given at the discretion of the Committee to any exceptional circumstances justifying an extension to the Special Survey completion date for a maximum period of three months beyond the validity of this certificate.
3. Prior to the endorsement of this certificate all overdue hull and machinery surveys should be dealt with or postponed by agreement.
4. In normal circumstances the Annual or Intermediate Survey is to be held in conjunction with the Periodical Load Line Inspection and the Safety Construction Annual Survey.

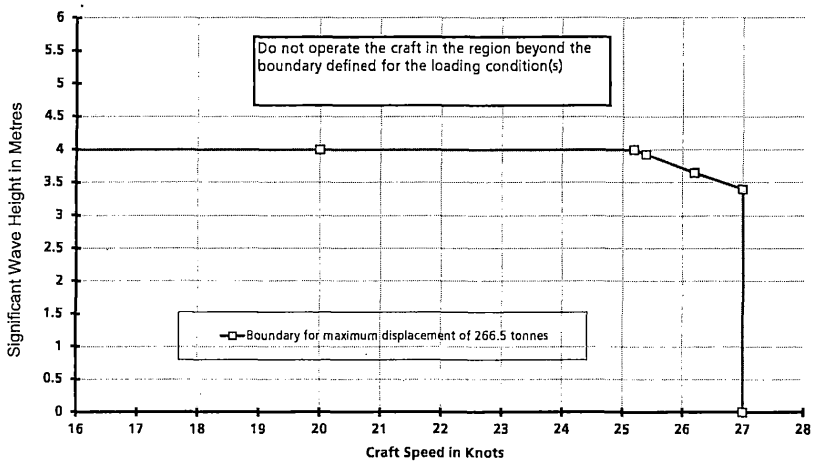
Operational Envelope (Special Service Craft)

Craft Name:	**CORPORAL MCLAREN M.M.V**	Builder:	**HALIFAX SHIPYARD LTD**
Yard Number:	**6099**	IMO Number:	**9586083**
Class Notation:	**✠100A1 SSC Patrol, Mono, HSC, G4**		



Information for the Owner and Operator:
The Operational Envelope shown above is an integral part of the Certificate of Class and must be permanently displayed in the wheelhouse within the viewing area of the Master and/or Helmsman.

Under the terms and conditions of Classification it is the responsibility of the operator to load and operate this craft at all times in a seamanlike manner and in accordance with the conditions of classification and restrictions shown in the Operational Envelope and Service Area Restriction. Failure to comply with these requirements may result in the suspension or withdrawal of class.

The Operational Envelope has been calculated using the Rules and Regulations for the Classification of Special Service Craft to indicate the limiting speed and significant wave height combinations at which the craft may operate. The significant wave height of a fully developed irregular sea is the average of the one third highest waves in a short term wave measurement record, and closely approximates wave heights reported by experienced seafarers. Where the prevailing sea state exceeds the approved parameters the Master must adjust speed accordingly and seek calmer waters or refuge.

The Service Area Restriction "**G4**", as defined in the Rules and Regulations for the Classification of Special Service Craft as "Service Group **4**", covers craft **intended for service in waters where the range to refuge is 250 nautical miles or less**

Issued at ***Toronto*** on **24 July 2014**

INTERNATIONAL REGULATIONS FOR HIGH-SPEED CRAFT AN OVERVIEW*

Heike Hoppe
International Maritime Organization (IMO)
4 Albert Embankment, London SE1 7SR, United Kingdom

ABSTRACT

The paper presents an overview of the international regulations in force concerning high-speed craft, i.e. the Code of Safety for Dynamically Supported Craft (DSC Code) and the International Codes of Safety for High-Speed Craft 1994 and 2000. The historical background of the development of regulations for high-speed craft is briefly highlighted and the technical contents of the Codes are described. The status of the Codes, i.e. mandatory or recommendatory, is explained, together with their association with the International Convention for the Safety of Life at Sea (SOLAS) 1974. Finally, on-going work in IMO regarding the review of the Codes and the preparation of appropriate amendments is outlined.

INTRODUCTION

The international conventions ratified in respect of conventional ships and the regulations applied as a consequence of such conventions have largely been developed with construction and operation aspects in mind. Traditionally, ships have been made of steel and have been expected to operate on a world-wide basis with a minimum of operational controls.

The requirements for ships engaged on long international voyages are therefore framed in such a way that, providing the ship is presented for survey and a Ship Safety Certificate is issued, the ship may go anywhere in the world without any operational restrictions being imposed. Providing the ship is not involved in a casualty, all that is needed is to make it available to the Administration for the purpose of a satisfactory renewal survey before the Ship Safety Certificate expires and the Certificate will be reissued.

However, the traditional method of regulating ships should not be accepted as being the only possible way of providing an appropriate level of safety. Nor should it be assumed that another approach, using different criteria, could not be applied. Over a long period of time, numerous new designs of marine vehicles have been developed and have been in service. While these do not fully comply with the provisions of the international conventions relating to conventional ships built of steel, they have demonstrated an ability to operate at an equivalent level of safety when engaged on restricted voyages under restricted operational weather conditions and with approved maintenance and supervision schedules.

1. HISTORICAL DEVELOPMENT OF HIGH-SPEED CRAFT REGULATIONS

1.1. General

The safety philosophy of the regulations for high-speed craft (HSC) is based on the management and reduction of risk as well as the traditional philosophy of passive protection in the event of an accident. Management of risk through accommodation arrangements, active safety systems, restricted operation, quality management and human factor engineering should be considered in evaluating safety equivalent to current conventions. The application of mathematical analysis to assess risk and determine the validity of safety measures is encouraged.

The regulations take into account that a high-speed craft is of a light displacement compared with a conventional ship. This displacement aspect is the essential parameter to obtain fast and competitive sea transportation and consequently the regulations allow for use of non-conventional shipbuilding materials, provided that a safety standard at least equivalent to conventional ships is achieved.

To clearly distinguish such craft, criteria based on speed and volumetric Froude number have been used to delineate those craft to which these regulations apply from other, more conventional, craft.

EKME # 3045742v1 Updated 2014/03/07 *(J. Richardson original author)*

2014	2590	Major National	Normal		Relocation of M/E and S/S start air pressure guages and M/E sensors	All of the start air pressure gauges should be relocated to a position after the isolation valves for the respective engines. The same is also true for the pressure transducers for the main engines; these too should be relocated after the isolation valves and separated so that each pressure sensor is connected to its own engine.	Mid-Shore Patrol (MSPV)	Compressed air lines and guages	Auxillary Systems	Matt Klebert	Atlantic Region	06/12/2014	Cancelled	2014-12-09: Acknowledgement: Email sent to originator to submit completed and signed CCR by approved users and Region authorities.								
2014	2591	Minor	High		Addition of Primary Sock Filters to the RO SW suctions	1. The prefilters for the RO's are expensive and we are changing them quite frequently. The solution to this problem would be to add 20-25 micron sock type filters on the suction to each RO with a crossover in between to facilitate cleaning of the filter without having to shut the unit down. Another option which may prove to be more beneficial is to have a common suction line that's large enough to accommodate both RO's with a duplex course strainer and a duplex sock filter. This may prove to maximize on the lack of space in the bow thruster compartment. 2. The boost pump for the upper RO, should be turned around on the other vessels as well so	Mid-Shore Patrol (MSPV)	Reverse osmosis water maker	Auxillary Systems	Matt Klebert	Atlantic Region	06/12/2014	Cancelled	2014-12-09: Acknowledgement: Email sent to originator to submit completed and signed CCR by approved users and Region authorities.	Replaced by 2694

EKME # 3045742v1 Updated 2014/03/07 *(J. Richardson original author)*

2014	2594	Minor	High		Addition of Duplex SW strainer for ship service Generators	At present, there is no means of cleaning the strainer fitted inside the Sea Water regulating valve for the auxiliary generators without having to shut it down and change over to the standby generator. This has become problematic because the filtering capability of the small mesh screen is insufficient. It takes very little debris to clog up the strainer which in turn causes the jabsco impeller sw pump to go into a vacuum state. This has the potential to damage the vanes on the impeller. There is often a frequent requirement to clean the filters due to the water the vessel may be operating in. This has become very tedious and has also subjected the strainer in the valve, as	Mid-Shore Patrol (MSPV)	Sea water system for ship service generators	Auxillary Systems	Matt Klebert	Atlantic Region	06/12/2014	Cancelled	2014-12-09: Acknowledgement: Email sent to originator to submit completed and signed CCR by approved users and Region authorities.									
2014	2595	Minor	Urgent		Secure AIS Transponder for FRC	Installation of a Secure AIS System similar to that of the offshore C&P vessels in Atlantic region, that will permit the ship to track the RHIB on AIS, yet remain undetected to any other vessels in the area that may be receiving AIS information.	Mid-Shore Patrol (MSPV)	RHIB electronics	Deck Equipment / Ship Support Systems	Fred Emeneau	Atlantic Region	06/12/2014	Acknowledged	2014-12-09: Acknowledgement: Email sent to originator to submit completed and signed CCR by approved users and Region authorities. 2016-12-05 This CCR is not a regulatory requirement. CCR is not supported by operations unless a change to regulations take place. 2017-01-24 Update: Some vessels have already installed. Dave Wyse.

Western piping too heavy.							
2015	2694	Major	High		Addition of Primary Sock Filters to the RO SW suctions	1. The premiers for the RO's are expensive and we are changing them quite frequently. The solution to this problem would be to add 20-25 micron sock type filters on the suction to each RO with a crossover in between to facilitate cleaning of the filter without having to shut the unit down. Another option which may prove to be more beneficial is to have a common suction line that's large enough to accommodate both RO's with a duplex course strainer and a duplex sock filter. This may prove to maximize on the lack of space in the bow thruster compartment. 2. The boost pump for the upper RO, should be turned around on the other vessels as well s	Mid-Shore Patrol (MSPV)	Reverse osmosis water maker	Auxillary Systems	Matt Klebert	Atlantic Region	06/12/2014	Approved by CCB	2014-12-09: Acknowledgement: Email sent to originator to submit completed and signed CCR by approved users and Region authorities. 2015-04-09 Supported by CCR Committee. 2015-04-10 CCR is Approved in Principle for MSPV Class. Note from HME, Marine Engineer: Engineering OPI to follow up that installations were performed and that any drawings are updated.						Resubmitted due to loss regionally

CCR Prioritization List for MSPVs

EKME # 3045742v1 Updated 2014/03/07 *(J. Richardson original author)*

2015	2830	Major National	Normal	Both	Install isolation valve for ME manual priming pump	here are no isolation valves between the day tank and the port or starboard main engine fuel oil manual priming pumps. In the event of a failure of the diaphragm inside the manual hand priming pump, there is presently no means to isolate the pump to make repairs unless the main engine supply valve is closed at the day tank. We are proposing to insert a shutoff valve on the supply side of each manual priming pump. There is room to modify the existing DN15 piping to insert a new DN15 bronze globe valve complete with compression fittings and seals below the manual priming pump in front of each main engine.		Fuel oil system				18/12/2015	Routed HME Engineering	2015-12-18, Ack. CCR Registration, Received CCR Form completed, Document Routed to Operation for Rev./Support. 2015-12-18 Supported by Operations, sent to ME Davis Wyse for Signature. 2016-02-22 CCR Supported by CCR Committee, on list for next CCB for Approval. 2016-03-07, Engineering OPI is Dave Wyse CCR is Approved in Principle by CCB.									
2015	2831	Major National	Normal	Both	Stern draft marks on Hero Class	The stern draft markings are on the port and starboard aft quarter. Due to the hight of most docks that we secure at it is almost impossible to read the after draft marks when we are dockside. Add another set of draft marks on the transom.		Draft marks				18/12/2015	Approved in Principle	2015-12-18, Ack. CCR Registration, Received CCR Form completed, Document Routed to Operation for Rev./Support. 2015-12-23 CCR Supported by CCR Committee, 2016-01-15 CCR is Approved in Principle, Engineering OPI David Wyse.	Vladykov has done something similar, must be Lloyds approved during implementation							
2015	2833	Major National	Normal	Both	Hero Class HVAC condensing receiver	The receivers installed on the HVAC system do not have a safety margin for increases of pressure in the system which have caused refrigerant discharges. A new receiver and safety valve are required for this type of refrigerant and system with a greater safe working pressure.		HVAC unit				04/01/2016	Acknowledged	2016-01-05, Ack. CCR Registration, CCR Form Section 1 to 5 should be completed, Section 6: Signed by Regional Authorities, then returned to National CCR Committee for Rev./Support. 2017-01-24 Implemented before CCR (none), Dave Wyse.

2014	2398	Major	Normal		Shelf Removal Wet Gear Locker	At present the design configuration for the Wet Gear Locker does not allow for effective storage and drying of wet gear due to lack of space. There is insufficient space, with the current arrangement, to hang the gear that would be hung in the space during normal operations. There is no other space within the vessel to hang gear that is wet. When wet gear is placed in this locker it is dripping onto any items stored on the shelf unit in questions. See attachment. The largest of the two shelf units that are presently located in the Wet Gear Locker is to be removed from the vessel and placed in storage ashore. The smaller of the two shelf units is to be re-positioned to allow for easy access to the locker. Removal of the shelf unit will allow for wet gear to be properly hung and dried in the space. The shelf unit weighs approximately 120lbs. Given the restrictions regarding the addition of weight on this vessel the removal of this shelf would be a benefit in this regard.	Mid-Shore Patrol (MSPV)	Wet Locker	Deck Equipment / Ship Support Systems	Alexander J Curry	Atlantic Region	2014-01-06	Routed to ACM	2014-01-07 This CCR is MSPV Class, Scope is changed to Major. Ack. CCR Registration. Email sent to Originator: If CCR not already done, Please submit Form when Completed and Signed (Approved by Users and Region Authorities). 2014-01-24 Received CCR Form Completed and signed, Documents are routed to CCR Committee.	Shelf has been removed on Vessel 5 and kept in storage in case it needs to be put back.	3041-1388							
2014	2608	Major	Normal	Both	MSPV - Removal of UHF Antennae in way of Running lights	Remove two UHF antennae (1 each on port and starboard side) that produce reflected light in way of the port and starboard side (red and green) running lights on all vessels of the MSPV Class. Existing wiring to be preserved in place and waterproofed in case of future requirements.	Mid-Shore Patrol (MSPV)	UHF Radio Antennae	Vessel Communications and Navigation	Michael Glew	NCR	2014-01-20	Approved by CCB	2014-01-21, Ack. CCR Registration. Email sent to Originator: If CCR not already done, Please submit Form when Completed and Signed (Approved by Users and Region Authorities). 2014-02-06 Received CCR Form, Request is Supported by Manager Operational Requirements Jim Nunn, info is Routed to CCR Committee for Revision. 2014-02-13 CCR is Supported by CCR Committee. CCB is Approved in Principle by CCB, Radio must be removed if still installed. E & I would prefer that cable be removed, also DWG should be updated.	Work must be completed exactly as described in the ECR: remove antenna and tape ends. Antennas have been removed on Kaeble, other vessels should be done by end of March.	3041-1388							
2014	2498	Major National	Normal	Both	MSPV - Trash compactor removal (C&A G1 sector vessels)	Removal of trash compactors onboard that are not in use. Consists of unbolting the compactor and removal from space. Space will then be used for storing addition deck equipment. 2014-06-06 CCR Approved in Principle for MSPV Class.	Mid-Shore Patrol (MSPV)			Melvin Tun	Central and Arctic	04/04/2014	Approved in Principle	2014-04-09 Ack. CCR Registration. Email sent to Originator: If CCR Form not already produced, please submit when completed and signed (Approved by Users and Region Authorities). 2014-04-17 Received CCR Form and DWG, Documents are Routed to CCR Committee for Rev / Support. 2014-04-25, CCR Raised to Major (applies to MSPV Class), CCR Supported by CCR Committee, see complete comments from Operation. 2014-05-06 CCR Approved in Principle for MSPV Class. Storage part of the proposed solution is not approved at this time, until weight control analysis is completed and program in place, Greg Lick Dir. Operations.	Supported by all MSPVs, supported by fleet, waiting for CCB approval	3041-127							
2014	2504	Major National	High		Required Changes to Safety Control Plan and Fire Control Plans on MSPV's	Changes proposed were adopted shortly before transiting vessels back to C & A region for safety reasons. Extra lifejackets required and/or immersion suits depending on the number provided by shipyard at time of delivery. Plan approval cost $3,500.00 per vessel. Extra 5 Life Jackets.	Mid-Shore Patrol (MSPV)	Fire Plan Update and approval	Select System	Christian Jensen	Central and Arctic	23/05/2014	Approved in Principle	2014-05-27, Ack. CCR Registration. Email sent to Originator: If CCR not already done, Please submit Form when Completed and Signed (Approved by Users and Region Authorities). 2014-12-05:Registered. routed for signatures and email sent to originator.								
2014	2511	Major	Urgent		Replacement of Air to Ground Antenna on MSPV	Antennas currently fitted on the MSPV generate a High VSWR outside specification. The existing grounding plane is a 6"x6" and manufacturer confirmed that there was a misprint in documentation and a 6'x6' grounding plane was required for existing antenna. This can't be achieved on this class of vessel. To replace the existing antenna with the SG2.5B-SF15NM as this is the Standard throughout the Fleet. Substantially improve performance by meeting the VSWR Standard specification.	Mid-Shore Patrol (MSPV)	Jotron TR7725	Vessel Communications and Navigation	Pierre Lamycon	Atlantic Region	02/06/2014	Supported by ACM and CCB committee	2014-06-02, Ack. CCR Registration. Email sent to Originator: If CCR not already done, Please submit Form when Completed and Signed (Approved by Users and Region Authorities). 2014-06-25 CCR Urgent, Routed to Operation for Rev. / Support. 2014-11-06: Supported by MME see complete note in EKME #3287158. 2014-11-07 CCB agreed to return to CCB note for E&I support.								
2014	2529	Major National	High		Lubrication Program Modifications for the Hero Class Mid Shore Patrol Vessels	The modification of lubrication related equipment aboard the vessel both minor, such as the addition of breathers, filters, ISO quick disconnects and offline / delivery filtration units. The optimization of lubricants using lubricant identification labels on equipment and reservoirs with the standardization of the storage and handling practices based on industrial best practice and WHMIS recommendations. The standardization of the process for the collection of oil samples, using sample ports with the setup of equipment specific lubricant alarm limits and recommended actions.	Mid-Shore Patrol (MSPV)	Systems modified are detailed in the EKME Document #3286567	Propulsion/Maneuvering Systems	John Riga	NCR	24/07/2014	Supported by ACM and CCB committee	2014-07-25, Ack. CCR Registration. Email sent to Originator: If CCR not already done, Please submit Form when Completed and Signed (Approved by Users and Region Authorities). 2014-08-15 Received CCR form signed by Originator, with specification document: EKME: 3337804, also Lubrication Program available on EKME: 3286567. 2014-11-06, CCR supported by CCB Committee, Routed to CCB for Approval.								
2013	1647	Major National			Modification compartiment à batterie devant timonerie	Le compartiment utilisé pour le rangement des batteries d'urgences est très grand et ne contient que 4 batteries. Le compartiment est situé sur le devant de la timonerie avec un accès par deux écoutilles extérieurs. Le compartiment est muni d'une entré d'air et de deux sorties. Il est de plus muni d'une élément chauffant. Le navire ne dispose pas de rangement pour l'entreposage des boyaux et de l'équipement utilisé pour les ravitaillement en eau potable. Selon la procedure 7.A.12 Qualité de l'eau Potable du manuel de sécurité de la flotte, les boyaux utilisé pour l'eau potable doivent être purgés, scellés et entreposés dans un caisson propre, sécuritaire et utilisé exclusivement pour l'entreposage d'équipement d'approvisionnement en eau potable. Déplacer deux batteries avec leurs assises sur le côté bâbord du compartiment. Fabrication et soudure d'une cloison en aluminium étanche au milieu du compartiment afin de créer une séparation. Garder la ventillation naturel des deux compartiments. Protéger l'isolation sur les parois à l'aide de grillage. Installer un drain dans le fond du compartiment. Déplacement (re-localisation) de deux extincteurs dans le même compartiment. 2013	2649	Major National	High	Risk Assessment - Transformers Mitigation Plan	Implement mitigation plan as it relates the the Risk Assessment - Transformers	1 pilot vessel 1. Change location of the emergency generator fuel tank vents to outside 2. Metal protective shields around transformers 3. Addition of ground fault monitoring capabilities 4. Move discharge for inline drains from duct work in AmR 5. Install heat trace on hatches 6. Replace battery boxes in emergency gen room with proper type 7. Installation of burst pipe protection on certain pipes	Mid-Shore Patrol (MSPV)	Electrical Power Distribution	Various	Chris Dort	NCR	18/02/2015	Approved in Principle	2015-02-19: Routed to CCR Coste for approval/signatures. 2015-02-02 CCR supported by CCR Committee, note added to file from HME engineering: " From Hull perspective the weigh is the only issue, estimated to 450 lb.", this modification will reduce the actual margin. Technically it looks all right. 2015-03-13 CCR is Supported by CCB Secretariatly.	1424971		Glassey	Nanires / Vessel		2649	19/02/2015	02/03/2015	
2014	2690	Minor	High		Addition of Duplex SW strainer for ship service Generators	At present, there is no means of cleaning the strainer fitted inside the Sea Water regulating valve for the auxiliary generators without having to shut it down and change over to the standby generator. This has become problematic because the filtering capability of the small mesh screen is insufficient. It takes very little debris to clog up the strainer which in turn causes the Jabsco impeller sw pump to go into a vacuum state. This has the potential to damage the vanes on the impeller. There is often a frequent requirement to clean the filters due to the water the vessel may be operating in. This has become very tedious and has also subjected the strainer in the valve, as well as the valve itself to suffer damage due to the number of times it's had to have been opened up. The screens located in the regulator are also inadequate in that it still allows debris to pass by and clog up the cooler tubes on the engine. This was observed on the 2000 hour inspections for both generators. The recommended solution is to fit a duplex sw strainer on the main sw supply line to the generators. The best location for minimal interference would be aft of the port main engine underneath the flow meter for the stern tube cooling. The main sw supply piping to the generators would have to be modified slightly to accommodate the duplex strainer. The sw piping to the stern tube cooling water regulator may also have to be modified as well to accommodate the strainer.	Mid-Shore Patrol (MSPV)	Sea water system for ship service generators	Auxillary Systems	Dave Wyse	NCR		Approved by CCB	Resubmitted nationally as was lost in regional process Contract is in the technical evaluation stage									
2016	2691	Major	Normal		Aft Gate Access for embarking or disembarking RHIB	The solution we have come up with is to add additional gates in the railings on the aft end of the vessel in order to come and go from the RHI in a safer manner that we are able to with the current arrangement. Attached you will find pictures of the sections to be removed in order to install new gates along with a sample picture of what we would like installed. The estimated cost of installing the gates is $1750-2200. The only difference from the sample pictures that we would like to see is that the gate simply be removable with pins instead of a hinge.	Mid-Shore Patrol (MSPV)	Aft railings	Hull and Related Structures	Dave Wyse	NCR		Approved by CCB	Resubmitted nationally as was lost in regional process									
2015	2692	Major National	High		FO Tank vents removable sections	Currently, #1, #2, and #3 Fuel tanks share a common overflow/vent line that connects to the forward port corner of #9 FO Storage Tank. The overflow/vent lines from those forward tanks have loops that extend above the deck, port side forward. These loops are solidly welded with no means to break the lines to facilitate testing of the tanks individually. In the future, when testing is required again by the Classification Society, we will have to have a means to test the individual tanks and at present, that is not possible as all of the tanks are connected together through this common vent/overflow. Note 9 of the "Air Pipes and Sounding Diagram" stipulates that the "Combined air escapes shall be fitted with a removable section to permit the testing of the tanks individually." The air vent for #9 FO tank is located at the forward port corner of the tank. #9	Mid-Shore Patrol (MSPV)	Fuel overflow system	Auxillary Systems	Dave Wyse	NCR	08/12/2014	Approved by CCB	Resubmitted nationally as was lost in regional process Spec and drawings sent to have implemented. Lloyds can approve locally									
2015	2693	Major National	High		#9 Fuel Oil Tank reconfiguration	The air vent for #9 FO tank is located at the forward port corner of the tank. #9 FO Tank is stepped and the vent is located at the lowest point of the tank top. This arrangement prohibits the complete filling of the tank since the higher part of the tank effectively becomes air locked. If fuel is still being pumped into #9 when the common vent/overflow line for #1, #2, #3 FO Tanks is blocked, there is a potential to pressurize those forward tanks. This will result in false high level alarms in all of the forward tanks since the Tank Level Indication System works off pressure sensors. The resulting alarms can cause confusion for those unfamiliar or new to the vessel. #9 FO Tank is essentially "full" when it's at approximately 75%. There have been special fuelling procedures developed in an attempt to fill the tank to a higher level but that is a compensation for poor design. The overflow/vent line loops above deck should be removed and have flanges installed to facilitate testing of the tanks individually. The vent line for #9 FO Storage Tank should also be connected to the aft section of the tank at its highest point. There would be no need to relocate the vent entirely, just an addition.	Mid-Shore Patrol (MSPV)	Fuel overflow system	Auxillary Systems	Dave Wyse	NCR		Approved by CCB	Resubmitted nationally as was lost in regional process Spec and drawings sent to have implemented. Lloyds can approve locally									

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2015	2694	Major	High		Addition of Primary Sock Filters to the RO SW suctions	1. The prefilters for the RO's are expensive and we are changing them quite frequently. The solution to this problem would be to add 20-25 micron sock type filters on the suction to each RO with a crossover in between to facilitate cleaning of the filter without having to shut the unit down. Another option which may prove to be more beneficial is to have a common suction line that's large enough to accommodate both RO's with a duplex course strainer and a duplex sock filter. This may prove to maximize on the lack of space in the bow thruster compartment. 2. The boost pump for the upper RO, should be turned around on the other vessels as well so that the pump casing is not directly adjacent to the shore power transformer and its openings. Ideally, this pump should be moved below the waterline as well. 3. The SW suction for the upper RO's should be lowered to the same level as the lower RO suction, which is to say below the waterline. If the upper RO Boost pump is lowered as well then this will ensure that both pumps can be easily primed. It will also be beneficial to lower the position of the 2-way valves for the respective RO's as well. These 2-way valves are much higher than the boost pumps and sea suctions and are used only when cleaning the RO membranes.	Mid-Shore Patrol (MSPV)	Reverse osmosis water maker	Auxiliary Systems	Matt Riebert	Atlantic Region	06/12/2014	Approved by CCB	2014-12-09: Acknowledgement: Email sent to originator to submit completed and signed CCR by approved users and Region authorities.						Resubmitted due to less regional		
2015	2698	Major	High	Both	Potable water UV sterilizer replacement	The Ultra-Violet (UV) sterilizers supplied with the MSPVs have proven to be unreliable and expensive to maintain. Several vessels in the class have already experienced issues with abnormally low intensity readings, despite following the OEM recommendations for maintenance.	Mid-Shore Patrol (MSPV)	Domestic Systems	UV sterilizer	David Wyse	NCR	15/04/2015	Routed to ACM	2015-04-16: Ack. CCR Registration. CCR sent to CCR Committee for Rev/Support. Waiting for trial information from the M. Charles - implementation went well		3H3098, 3H3097						
2015	2699	Major National	Urgent		Hero Class Water Fire Main Piping Replacement	Existing Condition: Currently 8 out of the 9 hero class vessels have stainless piping in the water extinguishing fire system. The incident reports and failure analysis have shown that the stainless steel piping is corroding and allowing water to leak. See attached reports. Recommended Solution: 1. 2 vessels in the C&A region have had a borescope inspection of the piping. The vessels in the Atlantic region will then be inspected and a priority list for a solution to be implemented will be formed. 2. An engineering study must be done to create a solution for the replacement of the piping (material, piping, class approved drawings, weight analysis, etc.) 3. A solution to be implemented for the Class. Anticipated Benefits: A solution to provide reliability of the water fire extinguishing system and solve the corrosion and leak issues. Impact on maintenance budget: High maintenance costs by implementing band aids whenever a leak is found, increase the life cycle of the system, ensure that the system is operational, ensure that no other equipment or materials or damaged due to leaks.	100	Fixed fire fighting system	MSPV	Dave Wyse				Final solution to be determined by senior management								NCR
2015	2700	Major	Normal		MSPV RHIB Wireless Intercoms	Currently, communication on board a Rigid Hull Inflatable Boat (RHIB) traveling at speed is very challenging. Wind and engine noise force boat operators to have VHF radios turned to MAX volume, and any communication between boat operators is done through shoulder taps and hand signals. Taking these safety issues into consideration and combining that with increased operational / program requirements, wireless headset communications is necessary aboard the RHIB's paired with the MSPV's. Install David Clarke wireless headset communication system, standard to Western Region SAR RHIB's.	Small Craft (SC)	16802807	Wireless Headsets	Adam Cochrane			Approved	Vessel Communications and Navigation	adam.cochrane@dfo-mpo.gc.ca	250-413-2853	Gabriel Chaikin	Gabriel.Chaikin@dfo-mpo.gc.ca	250-363-0228			
2015	2701	Major National	Normal		Hero Class Crane ram design change and remote control changes	Shorten the crane cylinder RAM to be able to engage the RHIB in the cradle. Belly pack remote controls do not allow for booming in and out simultaneously hoisting or lowering the crane. This function is required for safe operations with the crane. This must be rectified with the manufacturer. An engineering study must first be done to develop solutions and a prototype for the class. Existing Condition: 1. Currently the cranes on board the Hero Class vessels do not have enough vertical movement to reach the lifting hooks on the RHIB(s) while they are sitting the in the cradle. 2. The cranes cannot be operated safely because the control does not allow simultaneously hoisting or lowering and booming in or out using the remote belly packs. Recommended Solution: 1. An engineering study must be completed to acquire a solution for the issues above. 2. The solution must be planned and implemented across the class. Anticipated Benefits: The solutions will ensure safety and proper handling of the crane throughout the life cycle of the vessels. Impact and Maintenance Budget: Safety risks to personnel and risk of damaging assets.	Mid-Shore Patrol (MSPV)	Deck Equipment / Ship Support Systems	Hydraulic Crane	David Wyse	david.wyse@dfo-mpo.gc.ca	993-2710	Requested/ In Progress	Engineering contractor working on a solution					NCR	24/04/2015	Acknowledged	2015-04-24, CCR registered by LCM HQ, document routed to CCR Committe for Review/Support.

2015	2702	Minor	High		Ship Service Fuel System_addition of Primary fuel filters, Duplex Racor Unit	We currently have no primary means of filtration for the fuel system on the ship service diesels. The secondary filters that are fitted directly on the engine have become the only method of filtration and water separation. This arrangement has resulted in a number of "blackouts" due to the plugging of the respective filter. Suction and discharge pressure gauges were fitted on either side of the filter but these have proven to be inadequate as a tell-tale for when the filters need to be changed. When the generator shuts down on loss of fuel oil, the emergency bus momentarily dies until the Emergency Generator starts up and goes online. All of the navigation equipment is on that bus and those pieces of equipment vital to the safe navigation of the vessel do not have a dedicated UPS. The equipment all shuts down and takes time to restart. This could have extremely negative consequences especially in high traffic areas. It is recommend that Racor (Duplex) 75500MAMX with the 2010 filter elements be installed in the fuel supply line. This duplex unit can be installed in the main line fuel supply and is capable of servicing both generators. These units are also fitted with a differential gauge that gives a clear indication of when the filter element needs to be changed. It removes the guesswork of when the engine mounted filter should be changed especially since the gauges cannot be relied upon. This problem arises more commonly when new staffs are aboard the vessel and are not familiar with the system.	Mid-Shore Patrol (MSPV)	Fuel oil system	Auxiliary Systems	Dave Wyse	NCR			Resubmitted nationally as was lost in regional process									
	2703	Major National	High		MSPV Techsol A&M HMI Screen Install	EXISTING CONDITIONS:There is no Techsol Alarm and Monitoring Human Machine Interface (HMI) screen in Cabin 209 where the Senior Engineer will occupy if the Engine Room is going to be operating in Unmanned Machinery Space (UMS) mode and working 0700-1900. or if gender confliction requires the Senior Engineer to occupy that Cabin. RECOMMENDED SOLUTION: Install Techsol Alarm and Monitoring HMI in Cabin 209 and have the Senior Engineer occupy that cabin. Require Cat 5 Cable from PC #A. Require 24V DC power supply from UPS-B. Require 12" Seaview HMI screen.	Mid-Shore Patrol (MSPV)	Integrated Control Systems	Techsol Alarm and Monitoring	M.Charles Chief Engineer	Western Region	42122	Acknowledged	2015-06-05, Ack. 2015	2709	Major National	High		Install Maximo on MSPVs	MSPV's require an asset management system to be installed on ship servers to provide a comprehensive maintenance solution. As per the CCG commissioners guidelines, the AMS to be used on CCG vessels is to be Maximo.	Mid-Shore Patrol (MSPV)	Informatics Systems (IT)	N/A	Jordan Dim	NCR	13/05/2015	Supported by ACM and CCR Committee	2015-06-13, Ack. CCR Registration, CCR Form available on EKME:#3471224. Routed to CCR Committee (Operations) for Rev./Support. 2015-06-21 CCR Supported by CCR Committee and Routed to CCB for Approval, next CCB meeting June 12th. Engineering OPI at HQ is Jordan Dim supported by Regional VMM.		3471224							
	2712	Major National	Normal		Hero Class (MSPV) Navigation information in CO cabin/office	The new video collection/switching equipment and spare outputs already provides the basic capability. All that is required is a single cable run from the Operations Room cabinet to the Commanding Officers cabin. The cable distance may require a VGA to Ethernet converter.	Mid-Shore Patrol (MSPV)	Vessel Communications and Navigation	Navigation video collection	David Wyse		27/05/2015	Routed to Operation	2015-05-29, Ack. CCR Registration, CCR Form and documentations available on EKME:#3477622, 3477624, 3477525. Documents Routed to CCR Committee (Ops.) for Rev./Support.		3477622, 3477525, 3477624,							
	2713	Major National	Normal	Both	Hero Class (MSPV) Automatic Chlorination system	install in-line sanitation system between the ROs and the fresh water tanks. The system comprises mainly of a flow meter (to monitor the amount of water being sent from the ROs to the tanks), a dosing controller and pump (to analyze the volume of water produced, according to the flow meter, and add the appropriate amount of chlorine), and a static mixer to distribute the chlorine (this is a length of plastic pipe with baffles inside to promote turbulence. It is installed in the RO product water line)	Mid-Shore Patrol (MSPV)	Domestic Systems	Chlorinator	David Wyse		27/05/2015	Routed to Operation	2015-05-29, Ack. CCR Registration, CCR Form available on EKME:# , Routed to CCR Committee (Ops.) for Rev./Support.		3477533, 3477534							
2015	2737	Major National	High		Hero Class General and Fire Alarm Tones	The General and Fire alarms aboard the Hero Class vessels are two different tones. Ships officers and crew do not believe the general alarm has the minimum sound pressure levels to alert crew. The General and Fire alarms should be the same tone and ensure that the decibel levels meet requirements as per the Life Saving Appliances code and to satisfaction of the Commanding Officer. Merged with CCR 2400 - The present telephone communication system is not equipped with the Night Bells feature. When in port duty personnel are required to carry out Fire and Security rounds. If the vessel is on SAR standby duty personnel must be available to answer the telephone in the event of a SAR call. The Night Bell feature to be installed in telephone communication system. Installation of Night Bells will ensure that the telephones are answered even when duty personnel are carrying out other responsibilities onboard. Important calls, such as SAR calls, will not be missed. and 2114 - reprogramming numbering system	Mid-Shore Patrol (MSPV)	Safety and Security Equipment	Fire and General alarm bells	David Wyse	NCR	14/07/2015	Routed to Operation	2015-07-14, Ack. CCR Registration, request raised by HQ OPI David Wyse. CCR is Routed to Operation for Rev/Support.		3501378							
2015	2738	Major National	High		Hydraulic bow thruster damper	addition of a timer circuit on the bow thruster damper module to slow down the valve on the closing motion. This will help to stop hydraulic hammer on the Bow Thruster hydraulic circuit.								Parts to be sent to all vessels									

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2015	2776	Major National	High	Both	Bilge drainage for Hero Class	install limber holes for proper drainage in the outboard girders that support the main engines.								Spec and drawings sent to vessels. Lloyds has given us the go ahead									
2015	2758	Major National	Normal	Both	Hero Class (MSPV) Rope Locker ventilation	The compartment located on the forward, starboard end of the superstructure, adjacent to the HVAC compartment is not ventilated. On the Constable Carriere, this compartment is used to store mooring lines and other deck gear. Mold easily grows in this compartment due to the zero air flow. This poses a health hazard for the crew and has been brought up by the vessel's MOSH committee. It also prevents any damp lines or deck gear from drying properly. The wet gear locker is used in a similar way and is equipped with a supply inlet and exhaust outlet with an in-line fan. The addition of an intake line and an exhaust line with extraction fan would allow fresh air to circulate through the space.	11J05	Deckl ockers	Hull and Related Structures			Rope Locker		Waiting for final spec and drawings to send out	2015-07-29, Received CCR Form Supported by Region (Signed Section 6), document are Routed to Operation for Rev. / Support. After support this Major CCR will be sent to CCB for Approval, next meeting October 2, 2015-10-01 CCR Supported by CCR Committee.	3801306							
2015	2757	Major National	High	Both	Pumps power supply reconfiguration	Request for engineering study to connect the following pumps to Emergency Switch Board supply: CCP P3 pump x 2, MMR Bilge/Fire pump x 1, Sea Water Cooling pump x 1.			Propulsion/Manoeuvering Systems			pitch control, bilge and sea water cooling (stern tube) pump		Waiting on Lloyds approval	2015-09-29, Ack. CCR Registration, CCR Form Section 1 to 5 should be completed, Section 6: Signed by Regional Authorities, then returned to National CCR Committee for Rev./Suppor t. 2015-09-30 Routed to Operations for Rev/Support . 2015-10-01 CCR Supported by CCR Committee, Sent to CCB for Approval.	3801819	william.falco ner@dfo-mpo.gc.ca	902-440-6231					
2015	2326	Minor	High	Both	Power Supply for Emerg. Generator Control and Battery Monitor	Existing conditions: There is no indication of the current voltage of the start batteries, the only indication that they may be charged is the green LED on the battery charger, indicating that it is on and not outputting current, there is no low voltage alarm on CCAM's for the Emergency Generator control batteries. Recommended Solution: Install 30A battery monitoring module similar to what we have on UPS A and UPS B, refer to attached pic For this we will have to add a cable between the generator?s battery and the AMOI panel, add TMH32 modules, add point in the HMI and set the alarm, so in the event of low voltage an alarm will be triggered on the CCAM prior to losing the battery start function. (refer to UPS B 24 V wiring diagram for how the EGEN battery Charger should be wired up from 120V Emergency Switchboard panel breaker 3C04 with the battery monitor. Anticipated Benefits: Full monitoring of the voltage of the Emergency Generator's Start batteries. Triggered alarm point in the event that the DC voltage drops below a specified set point. Ensure the reliable operation of the redundant EGEN start function. Impact on Maintenance Budget: Without implementing this change, there could be the potential of a safety hazard if the Emergency Generator does not start up when required in the event of an emergency if the batteries are not fully charged. Maintenance cost of the proposal change will be minimal.	CAPTAIN GODDARD M.S.M.	Power Systems	Emergency Generator Control System and Batteries	Simon Williamson	goddard-chiefengineer@gpd.gc.gc.ca					3805288				2015-12-03, Ack. CCR Registration, Received CCR Form Completed/Signed, CCR Routed to Operation for Rev./Support.		
2015	2324	Major National	Normal	Both	Ship service generator fuel oil pressure indicators Hero Class	Install local fuel oil pressure gauges to the Ship service generators. Install remote fuel oil pressure indication and alarm points into the alarm and monitoring system.				David Wyse													
2015	2816	Major National	Normal	Both	Relocation of M/E and S/S start air pressure guages and M/E	All of the start air pressure gauges should be relocated to a position after the isolation valves for the respective engines. The same is also true for the pressure transducers for the main engines, these too should be relocated after the isolation valves and separated so that each pressure sensor is connected to its own engine.		Start air gauges		David Wyse		10/12/2015	Acknowledged								

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information

2015	2829	Major National	Normal	Both	Install drain to ship side on forward flush escape hatches	The flush design of these hatches and the inability to drain off the water is contributing to increased maintenance inside the space due moisture and corrosion, and a safety risk due to freezing and inaccessibility during the winter. The hatches are designed with a drain, but the shipyard capped this pipe and there was no contractual requirement to connect it. We are proposing to connect the existing 1-1/4 NPT drain valve on the underside of the hatch drain line to a new shell penetration above the waterline.		Hatches				18/12/2015	Approved In Principle													
2015	2830	Major National	Normal	Both	Install isolation valve for ME manual priming pump	here are no isolation valves between the day tank and the port or starboard main engine fuel oil manual priming pumps. In the event of a failure of the diaphragm inside the manual hand priming pump, there is presently no means to isolate the pump to make repairs unless the main engine supply valve is closed at the day tank. We are proposing to insert a shutoff valve on the supply side of each manual priming pump. There is room to modify the existing DN15 piping to insert a new DN15 bronze globe valve complete with compression fittings and seals below the manual priming pump in front of each main engine.		Fuel oil system				18/12/2016	Routed HME Engineering													
2015	2831	Major National	Normal	Both	Stern draft marks on Hero Class	The steri draft markings are on the port and starboard aft quarter. Due to the hight of most docks that we secure at it is almost impossible to read the after draft marks when we are dockside. Add another set of draft marks on the transom.		Draft marks				18/12/2015	Approved In Principle	Vladykov has done something similar, must be Lloyds approved during implementation											
2015	2833	Major National	Normal	Both	Hero Class HVAC condensing receiver	The receivers installed on the HVAC system do not have a safety margin for increases of pressure in the system which have caused refrigerant discharges. A new receiver and safety valve are required for this type of refrigerant and system with a greater safe working pressure.		HVAC unit				04/01/2016	Acknowledged												
2015	2850	Major National	Normal	Both	Hero Class flooring replacement	Replacement of the vessel linoleum flooring on an as required basis. Hero Class linoleum flooring is cracking and bubbling on every vessel. New marine flooring and sub floor will be trialed and if successful will be installed on the Hero Class vessels when required.																			
2015	2851	Major National	Normal	Both	Hero Class HVAC controllers	he HVAC controller aboard the CCGS A. Leblanc has been deemed by the OEM Bronswerk to be unserviceable and is not supported by the OEM anymore. A new controller is required.																			
2016	2863	Major National	Normal		Sea Chest grate failures Hero Class	Sea chest grates fitted to the Hero Class hulls are failing by losing fasteners and weld tabs. This in turn allows the grate to vibrate loosely on the hull of the ship and if lost will allow large debris or foreign objects to enter the cooling water system.	MSPV		Sea chest grate	David Wyse	NCR	11/03/2016	Routed to Operation	2016-03-15 Acknowledge Reception of CCR Form Completed, document are Routed to CCR Committee for Rev. / Support.		Folder: 9999999, CCR: 3999999, rev:3.4.5							
2016	2861	Major National	Normal		Black water transfer system Hero Class	The black water transfer/macerator pumps on the Hero Class have been failing prematurely. A solution is required to ensure that the pumps last more than months. The pumps are roughly 10k each to replace.	MSPV		Black water transfer/macerator pump	David Wyse	NCR	11/03/2016	Routed to Operation	2016-03-15 Acknowledge Reception of CCR Form Completed, document are Routed to CCR Committee for Rev. / Support.		9999999, 3999999, rev:3.4.5							
2016	2863	Major National	Normal		Gearbox cooler replacement solution Hero Class	There has been several gearbox cooler failures on the Hero Class vessels that have resulted in oil leaking out the cooling water discharge. A long term solution is required to avoid	MSPV		Gearbox cooler	David Wyse	NCR	11/03/2016	Routed to Operation	2016-03-15 Acknowledge Reception of CCR Form Completed, document are Routed to CCR Committee for Rev. / Support.		9999999, 3999999, rev:3.4.5							
2016	2864	Major National	Normal		Hero Class cooling system biofouling (mussel infestation)	Hero Class vessels in fresh water are having zebra mussel infestations in the cooling water systems that block the flow of cooling water. Hero Class vessels in salt water are having blue mussel infestations in the cooling water systems that are blocking the flow of cooling water. It takes a lot of time and man hours to clean the cooling water systems. A solution is required to prevent mussel build up in the cooling system	MSPV		Cooling water system	David Wyse	NCR	11/03/2016	Acknowledged	2016-03-15 Acknowledge Reception of CCR Form Completed, document are Routed to CCR Committee for Rev. / Support.		9999999, 3999999, rev:3.4.5							
2016	2865	Major National	Normal		Wet exhaust transom corrosion Hero Class	The transom at the wet exhaust ports are corroding. The steel plate at the transom is only 4mm thick. The flaps at the exhaust ports are made of aluminum and are being deformed which in turn is allowing water to enter the exhaust system and damage the silencers. The fasteners holding the exhaust flaps are also loosening and being lost at sea. A solution is required to prevent corrosion of the transom and not to allow water to enter back into the exhaust system.	MSPV		Transom and exhaust	David Wyse	NCR	11/03/2016	Acknowledged	2016-03-15 Acknowledge Reception of CCR Form Completed, document are Routed to CCR Committee for Rev. / Support.		9999999, 3999999, rev:3.4.5

High Priority	Year	CCR #	Scope	Priority	Variant	Title	Work Description	Dave Wyse Comments
High	2014	2504	Major National	High		Required Changes to Safety Control Plan and Fire Control Plans on MSPV's	Changes proposed were adopted shortly before transiting vessels back to C & A region for safety reasons. Extra lifejackets required and/or immersion suits depending on the number provided by shipyard at time of delivery. Plan approval cost $3,307.00 per vessel. Extra 5 life jackets.	Dave Wyse is comparing drawing submissions from RCMP vessels. Will go back to vessels to agree on one drawing to be approved. / Dave Wyse compare les soumissions de dessin à partir de navires de la GRC. J'y retournerai aux navires pour se mettre d'accord sur un dessin pour être approuvé.
High	[illegible]	2648	Major National	High	Risk Assessment - Transformers - Mitigation Plan	Implement mitigation plan as it relates the the Risk Assessment - Transformers	1 pilot vessel 1. Change location of the emergency generator fuel tank vent to outside 2. Metal protective shields around transformers 3. Addition of ground fault monitoring capabilities 4. Move discharge for inline drains from duct work in AMR 5. Install heat trace on hatches 6. Replace battery boxes in emergency gen room with proper type 7. Installation of burst pipe protection on certain pipes	Installed on G. Peddle and A. Leblanc, will send information to other vessels / Installé sur G. Peddle et A. Leblanc, va envoyer des informations à d'autres navires
High	2014	2690	Minor	High		Addition of Duplex SW strainer for ship service Generators	At present, there is no means of cleaning the strainer fitted inside the Sea Water regulating valve for the auxiliary generators without having to shut it down and change over to the standby generator. This has become problematic because the filtering capability of the small mesh screen is insufficient. It takes very little debris to clog up the strainer which in turn causes the jabsco impeller sw pump to go into a vacuum state. This has the potential to damage the vanes on the impeller. There is often a frequent requirement to clean the filters due to the water the vessel may be operating in. This has become very tedious and has also subjected the strainer in the valve, as well as the valve itself to suffer damage due to the number of times it's had to have been opened up. The screens located in the regulator are also inadequate in that it still allows debris to pass by and clog up the cooler tubes on the engine. This was observed on the 2000 hour inspections for both generators. The recommended solution is to fit a duplex sw strainer on the main sw supply line to the generators. The best location for minimal interference would be aft of the port main engine underneath the flow meter for the stern tube cooling. The main sw supply piping to the generators would have to be modified slightly to accommodate the duplex strainer. The sw piping to the stern tube cooling water regulator may also have to be modified as well to accommodate the strainer.	First trial set of strainers will be sent to the A. Leblanc in Mid May, once trialled ok, the rest of strainers will be ordered for July delivery / Première série de crépines d'essai sera envoyé à la A. Leblanc dans la mi-mai, une fois mis à l'essai ok, le reste de crépines sera commandé pour livraison Juillet
High	2015	2692	Major National	High		FO Tank vents removable sections	Currently, #1, #2, and #3 Fuel tanks share a common overflow/vent line that connects to the forward port corner of #9 FO Storage Tank. The overflow/vent lines from those forward tanks have loops that extend above the deck, port side forward. These loops are solidly welded with no means to break the lines to facilitate testing of the tanks individually. In the future, when testing is required again by the Classification Society, we will have to have a means to test the individual tanks and at present, that is not possible as all of the tanks are connected together through this common vent/overflow. Note 9 of the "Air Pipes and Sounding Diagram" stipulates that the "Combined air escapes shall be fitted with a removable section to permit the testing of the tanks individually." The air vent for #9 FO tank is located at the forward port corner of the tank. #9	Specification available, already installed on Caporal Kaeble and A. Leblanc / Spécification disponibles, déjà installé sur Kaeble et Caporal A. Leblanc
High	2015	2693	Major National	High		#9 Fuel Oil Tank reconfiguration	The air vent for #9 FO tank is located at the forward port corner of the tank. #9 FO Tank is stepped and the vent is located at the lowest point of the tank top. This arrangement prohibits the complete filling of the tank since the higher part of the tank effectively becomes air locked. If fuel is still being pumped into #9 when the common vent/overflow line for #1, #2, #3 FO Tanks is blocked, there is a potential to pressurize those forward tanks. This will result in false high level alarms in all of the forward tanks since the Tank Level Indication System works off pressure sensors. The resulting alarms can cause confusion for those unfamiliar or new to the vessel. #9 FO Tank is essentially "full" when it's at approximately 75%. There have been special fuelling procedures developed in an attempt to fill the tank to a higher level but that is a compensation for poor design. The overflow/vent line loops above deck should be removed and have flanges installed to facilitate testing of the tanks individually. The vent line for #9 FO Storage Tank should also be connected to the aft section of the tank at its highest point. There would be no need to relocate the vent entirely, just an addition,	Specification available, already installed on Caporal Kaeble and A. Leblanc / Spécification disponibles, déjà installé sur Kaeble et Caporal A. Leblanc
High	2015	2699	Major National	Urgent		Hero Class Water Fire Main Piping Replacement	Existing Condition: Currently 8 out of the 9 hero class vessels have stainless piping in the water extinguishing fire system. The incident reports and failure analysis have shown that the stainless steel piping is corroding and allowing water to leak. See attached reports. Recommended Solution: 1. 2 vessels in the C&A region have had a boroscope inspection of the piping. The vessels in the Atlantic region will then be inspected and a priority list for a solution to be implemented will be formed. 2. An engineering study must be done to create a solution for the replacement of the piping (material, piping, class approved drawings, weight analysis, etc.) 3. A solution to be implemented for the Class. Anticipated Benefits: A solution to provide reliability of the water fire extinguishing system and solve the corrosion and leak issues. Impact on maintenance budget: High maintenance costs by implementing band aids whenever a leak is found, increase the life cycle of the system, ensure that the system is operational, ensure that no other equipment or materials or damaged due to leaks.	Engineering study completed, waiting for Superintendants of Marine Engineering to decide on material to be used for piping, in the meantime vessels doing interim repairs to leaks / étude d'ingénierie terminée, en attente pour les surintendants de génie maritime de décider sur le matériel à utiliser pour la tuyauterie, dans les navires Entre-temps, faire des réparations provisoires quand il a des fuites

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information

High	2015	2701	Major National	Normal		Hero Class Crane ram design change and remote control changes	Shorten the crane cylinder RAM to be able to engage the RHIB in the cradle. Belly pack remote controls do not allow for booming in and out simultaneously hoisting or lowering the crane. This function is required for safe operations with the crane. This must be rectified with the manufacturer. An engineering study must first be done to develop solutions and a prototype for the class. Existing Condition: 1. Currently the cranes on board the Hero Class vessels do not have enough vertical movement to reach the lifting hooks on the RHIB(s) while they are sitting the in the cradle. 2. The cranes cannot be operated safely because the control does not allow simultaneously hoisting or lowering and booming in or out using the remote belly packs. Recommended Solution: 1. An engineering study must be completed to acquire a solution for the issues above. 2. The solution must be planned and implemented across the class. Anticipated Benefits: The solutions will ensure safety and proper handling of the crane throughout the life cycle of the vessels. Impact and Maintenance Budget: Safety risks to personnel and risk of damaging assets.	All vessels need to have hydraulic flow meters installed on power pack and then belly packs can be reprogrammed. Approval will be sought by Dave Wyse to install shortened ram on crane. / Tous les navires doivent avoir hydrauliques débitmètres installés sur bloc d'alimentation, puis les paquets de ventre peuvent être reprogrammées. L'approbation sera demandée par Dave Wyse pour installer ram raccourci sur grue.

CCR	Status
3070 – Hour meters	**Approved in principle**
3089 – echo sounders	
3103 – Stabilizers	
3107 – Reclassify ballast tanks to void tanks	
3187 – Alarm and monitoring renewal	Approved for prototype
3212 – removal of FWD speaker	
3213 – Crab pot hauler arm extension	Approved for prototype
3215 – At will whistle button	
3216- Navigation display relocation	
3140 – Remote control valve	
CCR 2017-3141 OFSV Class - Cabin Re-alignment	

New to be signed this week for CCB list

3219 Hero Class engine removal and overhaul	Approved for engineering
3220- Hero Class galley reconfiguration – replace CCR 2170.	
3221 – CCR 3102 to be broken up into pieces and CCR 3110 sent as major from region	**Approved in principle**

Cancel

CCR 2170 – replace with 3220.
CCR 3040 – not safe
CCR 3050 – replace with 3220
CCR 3051 – Already have CCR 2699
CCR 3110 – replace with 3221
CCR 3149- trials did not work out
CCR 3102 – CCB wants broken up into 21 different CCRs

Engineering to Implementation

2587 – Stern Quarter reinforcement
2797 – pumps on emergency power supply
2687 – Hero Class hull protection system – impressed current
2881 – Hero Class RHIB rifle case bracket

1 INTRODUCTION

1.1 INTRODUCTION

1.1.1 This is the Technical Statement of Requirements (TSOR) for the Mid-Shore Patrol Vessel (MSPV) that is to be capable of sustained operations out to 120 nautical miles (nm) offshore at high speeds. These vessels will be designed and built in a manner that meets each of the requirements set out in this TSOR.

1.1.2 The MSPV will be required to conduct patrols on Canada's sea coasts and on the Great Lakes and St. Lawrence Seaway System. The operational area extends from Canada's southern borders to approximately 55° North Latitude.

1.1.3 The MSPV shall meet all standards and references as detailed herein and shall be a steel mono-hull based on an existing proven parent design, as defined herein. There shall be no change to the underwater portion of the MSPV hull form as compared to that same portion of the proven parent design, except in way of appendages. The proven parent design shall have been used in the construction of a steel mono-hull vessel that has been in service for a minimum of two (2) years, and a minimum of 1000 hours in-service operation.

1.1.4 The MSPV shall be built and delivered in two variants. The first variant is the MSPV Maritime Security (MS) variant configured to accommodate two (2) Rigid Hull Inflatable Boats (RHIB). The second variant is the MSPV Conservation and Protection (C&P) variant configured to accommodate the port RHIB normally embarked and fitted for but not with either the starboard RHIB or the necessary system(s) and equipment to accommodate the starboard RHIB. Both MSPV variants are detailed herein.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2 GENERAL REQUIREMENTS

2.1 REFERENCE DOCUMENTS

2.1.1 The MSPV shall be designed and built in accordance with the references and standards stated herein.

2.1.2 Except where otherwise noted, the latest official version at time of bid closing of the listed references shall be used.

2.2 REGULATIONS AND STANDARDS

2.2.1 In addition to the specifications described herein, the MSPV shall be designed, built, and outfitted in accordance with:

a. Classification rules of a single approved Classification Society (Class) as listed in TP 13585 - Marine Safety Management System; and

b. All national statutory and regulatory requirements for certification as required by the *Canada Shipping Act 2001* (CSA) for a cargo vessel on Near Coastal Voyage, Class I, wholly between Canadian ports.

2.2.2 The Contractor shall be responsible to ensure that all the MSPVs are certified in accordance with CSA, including all related regulations and Class. Any TCMS or Class conflict must be resolved by the Contractor to the satisfaction of Canada.

2.3 REGISTRATION AND CLASSIFICATION

2.3.1 The MSPV shall be designed, built and outfitted to receive a Certificate of Class equivalent to a Lloyd's Register (LR) ✠100A1, Special Service Craft (SSC), High Speed Craft (HSC), Patrol Vessel (Patrol), Service Group 4 (G4), Unattended Machinery Space (UMS), Environmental Protection (EP), Propulsion Steering Machinery Redundancy (PSMR), Centralized Control Station (CCS), Integrated Computer Control (ICC).

2.3.2 Notwithstanding the MSPV's gross tonnage, the MSPV shall comply with Lloyd's Register HSC Code or equivalent.

2.3.3 The UMS Notation shall not include any automatic fuel transfer system. The size of any service tank(s) shall be in accordance with the fuel system requirements described herein.

2.3.4 The Contractor shall be responsible to demonstrate all Class equivalencies to Canada's satisfaction.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

3 GENERAL TECHNICAL REQUIREMENTS

3.1 DESIGN CONSTRAINTS

3.1.1 The general MSPV configuration shall meet all requirements identified herein.

3.1.2 Length Overall, the distance, in metres, measured parallel to the static load waterline from the foreside of the stem to the after side of the stern or transom, excluding rubbing strakes and other projections of the MSPV shall be between 37.0 metres and 43.0 metres (m).

3.1.3 Extreme appendage draft of the MSPV MS variant shall not exceed 3.0 m in the port departure condition as defined in TSOR paragraph 3.2.1.b in fresh water, with allowance for the 2.0 tonnes Contract Modification Margin applied at 0.3m above the MSPV design lightship VCG and Construction Margin of ½% of the MSPV design lightship displacement applied at 0.3m above the MSPV design lightship VCG. The Contract Modification Margin is to allow for any weight increases as a result of GFE being installed and to allow for approved design changes that may result in a Contract Amendment. Only Canada has the right to use this Contract Modification Margin for modifications.

3.1.4 Air draft of the MSPV C&P variant shall be less than 35.5 m in salt water in the arrival condition defined as one (1) RHIB embarked, 13% of the total installed diesel fuel tank capacity, 10% of the total installed potable water tank capacity, 90% of the total installed black and grey tank capacity and 10% of the total installed upper deck RHIB gasoline fuel tank capacity.

3.1.5 There shall be an enclosed Bridge with a Command Centre immediately aft of it on the upper level of the deckhouse. Port and Starboard Bridge Wing control stations shall be supplied and installed.

3.1.6 There shall be a clear view of the aft work deck such that deck operations can be visually monitored from the Bridge machinery control station (MCS) or the Bridge Wing control stations.

3.1.7 The aft deck of the MSPV MS variant shall be configured to accommodate two (2) RHIBs as detailed at Appendix 1 of the TSOR complete with suitable launching and recovery system(s).

3.1.8 On the MSPV C&P variant, only the port RHIB will normally be embarked on the aft deck. When only the port RHIB is embarked, the aft deck unoccupied space shall be at least 30.0m^2 of continuous deck space and shall have a minimum deck loading capacity of five (5) tonnes spread over the 30.0m^2 deck.

3.1.9 A liquid ballast system shall be supplied and installed to enable the crew to trim and heel the MSPV to design trim and within a 0.5° list to port or starboard when, respectively, only the port or starboard RHIB is embarked.

3.1.10 Provisions stowage shall be for a fourteen (14) day operational period for a complement of fourteen (14) personnel.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

3.1.11 Potable water tank capacity of the MSPV, based on a daily allowance of 150.0 litres per person and a complement of fourteen (14) personnel, shall be for a three (3) day period as a minimum and shall not include any potable water production.

3.1.12 The solid waste handling system shall be capable of handling waste for a complement of fourteen (14) personnel for a fourteen (14) day operational period in accordance with Table 4 as a minimum.

3.1.13 Black and grey water systems of the MSPV shall be designed and built to have a combined tank holding capacity for two days, 150.0 litres per day per person for fourteen (14) persons, and a sewage treatment facility designed for a complement of eight (8) to fourteen (14) personnel.

3.1.14 The MSPV shall be designed and built to be fitted-for-but-not-with two (2) 0.50 calibre heavy machine guns port and starboard side forward.

3.1.15 The MSPV shall have cabin accommodation for fourteen (14) personnel in either single or double cabins as described herein.

3.2 SPEED

3.2.1 The maximum speed of the MSPV shall not be less than 25.0 knots (kts) under the following conditions:

a. At a maximum propulsive power not exceeding a SCN with only the essential dependent auxiliaries of 5000.0 kW at the declared engine speed as defined in ISO 3046-1: 2002 (E) and ISO 15550: 2002(E). "Propulsive power" means the power in kilowatts that is specified in a vessel's certificate of registry or the total installed power in kilowatts that can be directed to propel the vessel, whichever is greater; and

b. In the port departure condition which is defined as fully crewed with fourteen (14) persons, fully provisioned, spared, ready for sea with diesel fuel at 95% of the total installed diesel fuel tank capacity including all fitted day and service diesel tank(s), if any, upper deck RHIB gasoline tank(s) at 95% of the total installed gasoline fuel tank capacity, potable water tank(s) at 100% full, black and grey water tanks empty, lube oil storage tank(s) at 100% full, and working deck fully outfitted in the MSPV MS variant with both RHIBs embarked with 100% of their total internal gasoline tank capacity in each as detailed at Appendix A1 of the TSOR; and

c. In Sea State 2 as detailed at Appendix 3 of the TSOR, or calculated equivalent; and

d. In salt water or calculated equivalent; and

e. Construction Margin and Contract Modification Margin as defined in TSOR paragraph 3.1.3 added.

3.3 RANGE

3.3.1 The range of the MSPV shall not be less than 2000.0 nm under the following conditions:

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

a. At a constant cruising speed of 14.0 kts; and

b. Not trailing or locking any shaft; and

c. Commencing in the port departure condition, as per paragraph 3.2.1.b above; and

d. For range calculation purposes, the total available diesel fuel shall be 82% of the total installed diesel fuel tank capacity including all fitted day and service diesel tank(s), if any, less the ship service generators' fuel consumption of the period traveled based on a preliminary electrical load analysis provided by the Bidder (Contractor). The 82% available diesel fuel is derived from:

i) A maximum diesel fuel tank capacity of the total installed diesel tank capacity at 95%; and

ii) A 3% deduction from the total installed diesel fuel tank capacity including all fitted day and service diesel tank(s), if any, to account for unusable diesel fuel; and

iii) A further 10% deduction from the total installed diesel fuel tank capacity including all fitted day and service diesel tank(s), if any, to allow for reserve diesel fuel; and

e. In Sea State 2 as detailed at Appendix 3 of the TSOR, or calculated equivalent; and

f. In salt water or calculated equivalent; and

g. Construction Margin and Contract Modification Margin as defined in TSOR paragraph 3.1.3 added.

3.4 HIGH SPEED ENDURANCE

3.4.1 For the MSPV, a sustained speed of no less than 25.0 kts shall be maintained for 24 continuous hours, as detailed at Appendix 2 of the TSOR Mission Profiles, under the following conditions:

a. At a maximum propulsive power, as per paragraph 3.2.1.a above, not exceeding a SCN of 5000.0 kW at the declared engine speed; and

b. Commencing in the port departure condition; as per paragraph 3.2.1.b above; and

c. For endurance calculation purposes, the total available diesel fuel shall be 82% of the total installed diesel fuel tank capacity including all fitted day and service diesel tank(s), if any, less the ship's service generators' fuel consumption for the period traveled based on a preliminary electrical load analysis provided by the Bidder (Contractor). The 82% available diesel fuel is derived from:

i) A maximum diesel fuel tank capacity of this total installed tank capacity at 95%; and

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

ii) A 3% deduction from the total installed diesel fuel tank capacity including any fitted day and service diesel tank(s) to account for unusable diesel fuel; and

iii) A further 10% deduction from the total installed diesel fuel tank capacity including all fitted day and service diesel tank(s), if any, to allow for reserve diesel fuel; and

d. In Sea State 2 as detailed at Appendix 3 of the TSOR, or calculated equivalent; and

e. In salt water or calculated equivalent; and

f. Construction Margin and Contract Modification Margin as defined in TSOR paragraph 3.1.3 added.

3.5 LOW SPEED ENDURANCE

3.5.1 The MSPV shall be capable of continuous slow speed operation, at 2.0 kts ahead for a minimum of eight (8) continuous hours as detailed at Appendix 2 of the TSOR Mission Profiles, in Sea State 1 as detailed at Appendix 3 of the TSOR, or calculated equivalent. The MSPV shall operate in all air and water environmental conditions listed at Table 1 - Environmental Conditions. If low speed endurance for the MSPV is achieved by not running all main engines, the MSPV propulsion system shall incorporate a method to trail a shaft(s) such that the non-running main propulsion engine(s) and shaft(s) shall be brought on line for propulsion in less than one (1) minute.

3.6 SERVICE LIFE

3.6.1 The MSPV shall be designed and built to meet a 25 year service life based upon the Mission Profiles as detailed at Appendix 2 of the TSOR.

3.6.2 All equipment utilized in the MSPV shall be of a commercial marine standard; durable and reliable enough to withstand the rigors of the intended service.

3.7 OPERATING ENVIRONMENTS

3.7.1 The MSPV shall be able to operate year round, day and night, in freezing rain, spray and icing conditions and, will occasionally transit through loose ice (less than 8/10 coverage). No icebreaking capabilities are required.

3.7.2 The MSPV, its propulsion and auxiliary equipment, and the associated fluid systems shall be designed and built to conduct operations, as per Mission Profiles as detailed at Appendix 2 of the TSOR, in up to and including Sea State 6 as detailed at Appendix 3 of the TSOR.

3.7.3 The MSPV and its systems shall be able to conduct operations as per Mission Profiles as detailed at Appendix 2 of the TSOR, in the environmental conditions listed in Table 1 below:

Air Temperature & Humidity	Minimum -20.0°C, 30% RH (fall and

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

	winter) Maximum 35.0°C, 95% RH (summer)
Water Temperature Range	Minimum -1.8°C to Maximum 30.0°C
Water Types	Fresh and Salt water
Sea Conditions	Primary Missions – Up to and including Sea State 5 (as detailed at TSOR Appendix 3) Secondary Missions – Up to and including Sea State 6 (as detailed at TSOR Appendix 3)

TABLE 1 - ENVIRONMENTAL CONDITIONS

3.7.4 The exterior equipment and machinery, excluding RHIB stowing and securing arrangements, shall be protected with secured waterproof covers. All machinery, structure, and outfit shall be designed and built to withstand the resultant loads from the ship and sea interactions and the environmental conditions.

3.8 OPERABILITY

3.8.1 Operability is defined as the sea keeping characteristics of the MSPV and the ability to put to sea and safely maintain program activities and tasks in the specified areas of operation and environmental conditions.

3.8.2 Any appendage based stabilizing systems shall be designed and built to shed, and prevent entanglement by, ropes and nets.

3.8.3 All horizontal surfaces, except the aft working deck, exposed to wind-driven spray on the MSPV shall be angled or cambered to minimize build-up of ice.

3.8.4 The MSPV shall be capable of holding station relative to a fixed or moored object to within ten (10) metres (m) in all conditions up to and including Sea State 5 as detailed at Appendix 3 of the TSOR.

3.8.5 The MSPV shall be capable of station keeping relative to a free floating object to within ten (10) m in all conditions up to and including Sea State 6 as detailed at Appendix 3 of the TSOR.

3.8.6 Safe access to all areas of the MSPV's open decks shall be maintained at speeds up to 5.0 kts in Sea State 6 as detailed at Appendix 3 of the TSOR.

3.8.7 The MSPV shall be capable of maintaining a course within 1.0° of desired heading in all conditions, with wind and seas from any direction relative to the MSPV's heading, within three (3) minutes at a speed of 14.0 kts.

3.8.8 The MSPV shall be capable of turning 180.0° to port or starboard at zero speed within its own length in up to and including Sea State 2 as detailed at Appendix 3 of the TSOR.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

3.8.9 The MSPV shall be capable of turning to port or starboard under power from a full stop, safely in all conditions up to and including Sea State 6, as detailed at Appendix 3 of the TSOR, with wind and seas from any direction relative to MSPV heading.

3.8.10 The MSPV shall be capable of steering effectively in all conditions up to and including Sea State 5 as detailed at Appendix 3 of the TSOR, while towing a vessel of similar displacement.

3.9 HULL DESIGN

3.9.1 There shall be no modification of the proven parent design except as set forth in paragraph 1.1.3 of the TSOR.

3.10 PROPULSION AND AUTOMATIC MACHINERY CONTROL SYSTEMS

3.10.1 The MSPV's propulsion and automatic machinery control systems shall be of a proven marine design configuration. The MSPV shall not have a propulsive power greater than a SCN of 5000.0 kW at the declared engine speed.

3.10.2 The main propulsion system and control equipment shall be selected from current models supported in Canada.

3.10.3 The MSPV's main propulsion system shall not be a water jet.

3.11 GENERAL ARRANGEMENT (GA)

3.11.1 The MSPV shall be designed and built with, as a minimum, the following separate spaces:

a. Fore Peak, Chain Locker and store for anchor, chain and rope storage; and

b. Cabins to accommodate fourteen (14) persons. There shall be two (2) adjacent single cabins, for the Captain and Chief Engineer, one (1) single cabin for the Program/Incident Commander and one (1) additional single cabin for a minimum of four (4) single cabins, and a maximum of five (5) double cabins; and

c. Galley and associated cold and cool rooms; and

d. Mess to seat at least ten (10) in one sitting; and

e. Four (4) washrooms; and

f. Command Centre; and

g. Electronic Equipment Room (EER); and

h. Wet Gear Locker; and

i. Bridge; and

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

j. Central Storeroom as detailed in Appendix 6 of the TSOR; and

k. Machinery Control Room (MCR); and

l. Main Machinery space(s) for propulsion machinery and electrical generators; and

m. Auxiliary Machinery Room(s) (AMR), if fitted; and

n. Steering Gear Compartment; and

o. Emergency Generator Compartment; and

p. Storerooms for provisions and equipment spares; and

q. Deck Workshop (does not need to be a separate space but facility needs to be provided); and

r. Garbage Handling Room; and

s. Sewage Treatment Room; and

t. Lockers as required for linen, tools, cleaning gear, spill control and disposal kits, Medical/SAR equipment and small arms.

3.11.2 The superstructure shall have safe exterior walkways on both port and starboard sides of the weather deck.

3.11.3 The open deck areas shall be designed and built for:

a. Anchor handling; and

b. Mooring; and

c. Equipment stowage; and

d. Ship to shore safe access; and

e. Transfer on and off MSPV when docked; and

f. Medical evacuation via helicopter off forecastle deck; and

g. Crab Trap and Gill Net Hauler handling and operations; and

h. RHIB and rescue boat operations; and

i. Crane operations; and

j. Towing; and

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

k. Search and rescue; and

l. Mast signalling; and

m. Use of the fitted for but-not-with two (2) 0.50 calibre heavy machine gun mounts.

3.12 ENVIRONMENTAL PROTECTION

3.12.1 The MSPV shall meet all Canadian Federal Environmental Legislation, as well as the provincial environmental Acts of all provinces adjacent to waters in the patrol areas described in paragraph 1.1.2. A system engineering approach shall be used to consider all applicable environmental aspects associated with the particular MSPV system(s). All ways in which the MSPV will interact with its surroundings shall be considered.

3.13 STABILITY AND SUBDIVISION

3.13.1 The MSPV shall not have a static list greater than 0.5° from upright in all loaded conditions as defined in TP 7301- Stability, Subdivision and Load Line Standards STAB7, excluding crane and RHIB operations. The MSPV shall not be trimmed by the bow in any loading condition.

3.13.2 The MSPV in all loaded conditions shall meet the requirements of TP 7301 - Stability, Subdivision and Load Line Standards STAB7 without the use of permanent water or solid ballast. Crane and RHIB operations are excluded.

3.13.3 When launching and recovering the RHIB over the side and in all crane operations, the MSPV shall not heel more than 7.0° and the freeboard shall not be reduced by more than 50%. In no case shall the freeboard be reduced to less than 0.30 m at any point along the MSPV.

3.13.4 The MSPV shall meet the damaged stability requirements of TP10943 (Part II) – Passenger Vessel Operations and Damaged Stability Standards for two-compartment flooding at the end of life, i.e. incorporating a growth margin defined as 2% of the MSPV design lightship displacement applied at 0.3m above the MSPV lightship VCG.

3.14 ELECTROMAGNETIC INTERFERENCE (EMI) AND ELECTROMAGNETIC COMPATIBILITY (EMC)

3.14.1 The MSPV shall be constructed such that all electric and electronic equipment is electromagnetically compatible in accordance with IEEE 45-2002 Section 4.5 and 4.6 and CCG 70-000-000-EU-JA-001 - Chapter 6 that sets limits for Electromagnetic Interference (EMI).

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4 HULL STRUCTURES

4.1 GENERAL

4.1.1 The hull construction of the MSPV shall be designed, built and outfitted to withstand loads up to and including Sea State 6 as detailed at Appendix 3 of the TSOR for all environmental conditions noted in Table 1.

4.1.2 All hull structure shall be of welded design.

4.2 MATERIALS

4.2.1 The superstructure of the MSPV shall be of marine quality aluminum alloy.

4.2.2 Inter-connections between steel structures and the aluminum superstructure shall be made by using explosive-bonded bi-metal strips.

4.2.3 Subject to Class approval, the certified marine grade aluminum alloys shall be 5083/5086-H32/H116 for plates, and 5083/5086-H111 or 6061-T6 or 6082-T6 for extrusions and shapes. 6061 alloys shall not be used in critical high stress areas.

4.2.4 There shall not be any direct contact of electrolytically dissimilar metals except as described in paragraph 4.2.2.

4.2.5 Paint, insulation, adhesives, or other items containing materials or components that emit noxious or toxic fumes at temperatures below 94.0°C shall not be installed or applied on hull structural material and superstructure. For paints and adhesives, this requirement applies after drying or curing is complete. Chromate based paints shall not be used.

4.2.6 Aluminum structural components shall not be threaded or tapped. Helical coil or pressed-in galvanically compatible threaded inserts shall be used when directed threading is required.

4.2.7 Nuts which are inaccessible shall be captured to allow reassembly and prevent backing off. Unless otherwise specified, self-locking nuts of plastic insert type or all-metal self-locking nuts of distorted type shall be supplied and installed to prevent bolt loosening caused by shock or vibration. Fasteners on walking areas of the upper deck shall be flush mounted to eliminate tripping hazards.

4.2.8 In the assembly of machinery units subjected to large reversing stresses such as screw gear and hydraulic steering cylinders, the forces tending to shift the unit on its foundation shall be countered by the use of fitted bolts, keys and dowel pins or other OEM approved methods. Propulsion machinery shall be secured by means of fitted bolts or other OEM approved methods. Bolts shall be inserted from the bottom of the foundation with the nut on top.

4.3 SHELL AND SUPPORTING FRAMING

4.3.1 To avoid propeller induced vibration, the lowest natural frequency of stiffened bottom shell plating in the after quarter of the MSPV shall not lie within a band of ± 20% of an excitation

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

frequency throughout the range of operating speeds of the MSPV and shall be subject to Class approval.

4.3.2 There shall be a minimum of 75 mm clearance between structural members and parallel plate butts and seams. Longitudinals shall be made continuous with butt welds, with those welds at least 75 mm from all shell butts. Frames shall be butt welded, with those welds at least 75 mm from any shell seam.

4.4 PILLARS AND STANCHIONS

4.4.1 Pillars and stanchions shall be landed on structural framing members and aligned with the webs of the supporting structure in the longitudinal and transverse planes.

4.5 INNER BOTTOM AND FOUNDATIONS

4.5.1 Wells constructed in a double bottom for the purpose of drainage shall all be capable of being emptied by mechanical pumping other than a hand pump.

4.5.2 Foundations shall be arranged in such a way to provide adequate clearance for servicing and disassembling modules or parts such as pumps, filters, valves and pistons without dismantling other machinery, structure or piping.

4.6 WEATHER DECK AND INTERNAL DECKS

4.6.1 Deck longitudinals shall be butt-welded throughout with those welds separated from all deck butts by at least 75 mm.

4.6.2 Openings shall be kept to a minimum in particular in the strength decks within the 3/5 length amidships.

4.6.3 All exposed decks shall have a camber set at 2% of beam, except for the aft working deck. A camber of 2% of beam or less is permissible on the aft working deck providing no deck equipment overhangs the deck-edge.

4.7 MINOR BULKHEADS

4.7.1 Outside corners of interior steel bulkheads in way of living and working spaces shall be rounded to prevent hazard to personnel.

4.7.2 The periphery of minor bulkheads shall not allow dust, sound and light to penetrate.

4.7.3 Non-structural steel or joiner bulkheads surrounding wet spaces shall have all-welded coaming extending a minimum of 10 cm above the deck covering.

000407

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.8 SUPERSTRUCTURE

4.8.1 The boundaries of all superstructures shall be of weather tight construction. Casings, houses, bulkheads, and other surfaces shall be fair, without buckles, kinks, or other similar surface irregularities. Where trunks penetrate decks, the deck cuts shall have rounded corners.

4.9 STRUCTURAL CASTINGS, FORGINGS

4.9.1 All finished forgings and castings shall have Original Equipment Manufacturer (OEM) or serial numbered identification markings.

4.10 DRAIN PLUGS

4.10.1 Docking drain plugs, minimum diameter 38 mm, fitted to heavy steel weld-in spigot insert plates, shall be fitted in all bottom compartments, skeg(s) and tanks to permit complete drainage of the MSPV when in drydock. Plugs shall be flush with the outside of the shell when installed. Plugs shall be identified by two (2) shapes of key recesses, one (1) for oil fuel tanks and lube oil tanks, and a different shape for other spaces. Two (2) stainless steel keys for each shape shall be supplied and stowed aboard in the Chief Engineer's Cabin, clearly marked as to purpose.

4.10.2 The position and key recess shape of each drain plug shall be specified on the as-fitted docking plan.

4.11 MAST

4.11.1 The mast structure and the associated platforms and overhangs shall be designed and built to provide rigid foundations to support the electronic navigation equipment such as radar and antennae. The magnitudes of vibration shall be designed so that the maximum vibration does not exceed the manufacturer's limitations for all pieces of equipment mounted on the mast or, if not stated by the manufacturer, that the vibration level in all operating condition does not adversely affect the performance of each piece of equipment.

4.11.2 A mast shall be fitted to carry radars, antennae, navigating lights, navigational aids, yard-arms with signal flag hoisting attachment, signals and sirens. The mast and supporting structure shall be designed and built to withstand wind loads up to and including eighty (80) kts, the weights of the structure and equipment and, the dynamic inertia loads due to ship motion.

4.11.3 The mast's first fundamental frequency shall not lie within a band of ± 20% of an excitation frequency throughout the complete range of operating speeds of the MSPV and shall be subject to Class approval.

4.11.4 Cleats for signal halyards including masthead flag and gaff shall be supplied and installed. Standing rigging shall be reduced to a minimum.

4.11.5 The mast shall be fitted with anchor points for fall protection and ladder rungs as required by MOSH regulations.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.12 RUDDERS

4.12.1 The rudders shall be streamlined in horizontal section and be of the type, area and contour suitable for the intended service. The rudders shall be double plated with internal horizontal plate stiffeners and round bar leading edge and shall be made watertight by welding, and then tested via an upper and lower plugs made of stainless steel. The internal surfaces shall be treated to prevent corrosion.

4.13 CHAIN LOCKER(S)

4.13.1 The chain locker(s), designed and built so that the chain(s) will be self-stowing, shall be sized to accommodate the chain(s) and to give at least 60 cm headroom when cable(s) is stowed.

4.13.2 The chain locker(s) shall be fitted with perforated removable floor plates suitably stiffened at a height of 150 mm above the bottom of the locker(s). Access to the chain locker(s) shall be within the MSPV fore peak by means of a hinged manhole(s). If a single chain locker is intended to house two chains, it shall be divided with a non-watertight centreline bulkhead. The bulkhead shall have semi-circular holes in line with access manhole(s) to act as toe and hand holes when inspecting the locker. Otherwise, alternate arrangements shall be installed to allow access to the locker bottom.

4.13.3 The bitter end connection(s) shall be located at the top of the locker(s), in protected but accessible locations to permit emergency release of the chain(s). The bitter end connection(s) shall be designed for shear failure under a runaway chain load equal to the breaking strength of the anchor chain.

4.14 RUBBING STRIPS

4.14.1 Deck edges shall be protected with smooth, steel, Schedule 80, half-round pipe moulding, welded to the hull and deck and fitted in way of, and for a minimum length of 0.5 m, each side of all mooring fittings.

4.14.2 A continuous, shock-absorbing rubbing strip shall be mounted on the MSPV's hull, approximately 800 mm below the deck edge, from the aft edge of the house on the port side, around the bow to the aft edge of the house on the starboard side. This rubbing strip shall be constructed using lengths of hollow, rubber, D-section fendering which shall be held between steel channel sections by vertical steel pins. The steel pins shall be welded to the channels at both ends of each pin. The steel channels shall be continuously welded to the MSPV's hull, be waterproof and shall be the only connection to the hull. Rubbing strips shall be sized appropriately for the MSPV, considering the hull thickness and local strengthening.

4.14.3 A smooth, steel, Schedule 80, half-round pipe moulding shall be continuously welded to the deck edge and hull aft of the shock-absorbing rubbing strip, butted to that strip with an aft-angled lap joint, to continue the rubbing strip protection along both sides of the working deck.

4.14.4 On the areas of the ship's side where launching and recovering of RHIBs and lifting of seized nets, traps and anchors could damage the hull, steel half-round pipe protection shall be

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

welded to the hull. These hull protection strips shall extend downward, butted at their top ends to the horizontal, half-round pipe, rubbing strip mentioned above, down to the deepest operating waterline. They shall be continuously welded on an angled pattern, be waterproof and be one (1) metre apart, with the lower ends diagonally aft of the upper ends, so as to deflect spray outward and cause the smallest possible reduction to speed. The lower ends of these half-round protection strips shall be tapered down to the hull over a 25 cm length and all rubbing strips shall be welded watertight.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

5 HULL OUTFITTING

5.1 MOORING AND TOWING SYSTEMS

5.1.1 A set of six (6) appropriately sized synthetic mooring lines shall be supplied with a one (1) m eye splice at each end. Stowage for the mooring lines shall be supplied and installed in the fore peak and aft peak.

5.1.2 Cleats and fairleads shall be arranged to support RHIB operations on the port and starboard side.

5.1.3 Arrangements shall be made for being towed and for towing another vessel of similar displacement in head seas, up to and including Sea State 5 as detailed at Appendix 3 of the TSOR. One (1) cruciform bollard and bow fairlead shall be supplied and installed for the lead of the towing gear when the MSPV is being towed. One (1) cruciform bollard and stern fairlead shall be supplied and installed on the centreline for use when towing another vessel.

5.1.4 The towline reel shall be installed in close proximity to the aft towing arrangement. The reel shall accommodate the towing line and shall have a reserve capacity equal to one layer warp of line to compensate for imperfect warping of the line during retrieval operations.

5.1.5 The towline reel shall be electrically or hydraulically driven and shall be designed to minimize its deck footprint. The reel shall be located so as to provide unobstructed access to the aft work deck and towing area. Local control shall be supplied and installed to pay in and pay out the rope. The control shall be of the safety type which, when released by the operator, will return to the off position. The reel shall be fitted with a mechanical release arrangement to allow emergency retrieval or release in the event of loss of power.

5.1.6 One (1) electrically or hydraulically driven capstan with local control and overload protection shall be installed on the aft work deck to provide hauling capability to either side of the MSPV. It shall have a minimum pull of 1,000.0 kg.

5.2 ANCHOR HANDLING AND STOWING SYSTEM

5.2.1 The MSPV shall be designed, built and outfitted with at least one working anchor and eight (8) shots of chain. A second anchor is required only as a spare and shall be stored onboard. The storage location shall be approved by the Technical Authority (TA) during the design review process. However, if the second anchor is intended to be fitted as a working anchor, it too shall be supplied and installed with eight (8) shots of chain. Two (2) of the eight (8) shots of each fitted chain shall be galvanized - one (1) fitted at the bitter end, and one (1) fitted at the anchor's end. The forecastle deck shall have a working area available for the operation of the anchor windlass and for normal deck operations.

5.2.2 Facilities and wash down points shall be fitted for washing the anchor(s) and chain(s).

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

5.2.3 A common anchor windlass and capstan shall be supplied and installed for anchor handling and warping operations. The windlass and capstan shall be electrically or hydraulically driven and shall be capable of hoisting home the anchor and fully extended chain.

5.2.4 Anchor chain stoppers shall be designed and installed and aligned in the path of the anchor chain(s). An arrangement shall be supplied and installed to ensure that the anchor(s) consistently trip and seat home firmly.

5.2.5 The design of the anchoring system shall be such that there is positive starting of the anchor(s) and the chain(s) upon release under all conditions of intact stability.

5.2.6 Arrangements shall be supplied and installed to stop water on the deck from flooding the chain locker(s). The chain locker(s) shall be designed and built such that the chain(s) is self-stowing. The chain locker(s) shall incorporate a non-manual pumping arrangement or drainage arrangement for the removal of water.

5.3 DECK CRANE

5.3.1 The MSPV shall have an articulated, marine, knuckle-boom hydraulic crane capable of lifting a minimum of 1.5 tonnes at a minimum distance of 2.5 m over both the port and starboard side of the MSPV in a minimum of Sea State 4 as detailed at Appendix 3 of the TSOR. The deck crane may form part of the specified launch and recovery system for the RHIBs, see Section 5.8. The crane shall be capable of rotating 360.0° and shall be installed on the aft work deck of the MSPV. The safe working loads (SWL) of the crane up to an including the maximum design sea state shall be indicated on the crane.

5.3.2 The crane shall be designed, built and certified in accordance with the Lloyd's Register Code for Lifting Appliances in the Marine Environment, or equivalent.

5.4 CRAB AND GILL NET HAULER

5.4.1 A removable, hydraulically driven, Marco Pot Line Hauler, J0117, Crab Trap Hauler shall be supplied and installed on the starboard side of the aft work deck area on the MSPV C&P variant. The Crab Trap Hauler shall be fitted to the deck crane or another suitable removable appliance capable of withstanding the vertical and side loads associated with retrieving 2.4 m conical crab traps requiring a maximum pull capacity of 800-kg in Sea States up to and including Sea State 4 as detailed at Appendix 3 of the TSOR. Hydraulic power shall be supplied and installed to the Crab Trap Hauler's hydraulic motor for operation.

5.4.2 A removable, hydraulically driven, Rapp Marine Power Block Type KB-08, Gill Net Hauler shall be supplied and installed on the starboard side of the aft work deck area on the MSPV C&P variant. The Gill Net Hauler shall be fitted to the deck crane or the same removable appliance used to mount the Crab Trap Hauler. Hydraulic power shall be supplied and installed to the Gill Net Hauler's hydraulic motor for operation.

5.4.3 The location of the Crab Trap Hauler, Gill Net Hauler, and removable appliance shall not interfere with the operation of the MSPV's fitted towing equipment.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

5.4.4 Any fittings or mountings associated with the Crab Trap Hauler, Gill Net Hauler, and removable appliance shall not interfere with the MSPV's ability to embark and deploy a starboard RHIB.

5.5 HYDRAULIC OIL SYSTEMS

5.5.1 Hydraulic power unit(s) shall be supplied and installed to provide hydraulic fluid to permanent and removable equipment fitted in and on the MSPV as required. Stainless steel quick-connections shall be supplied and installed on the aft working deck to provide fluid to removable equipment.

5.5.2 Deck hydraulic systems shall be equipped with heaters to prevent condensation and excess pressures on start up. The same type of hydraulic fluid shall be used for all the machinery, if approved by the OEM.

5.6 RIGID HULL INFLATABLE BOATS (RHIBS)

5.6.1 The aft working deck shall have work area available for the launch and recovery system(s) of Zodiac-Hurricane (SAR configuration) H753 RHIBs, embarkation and disembarkation of personnel, stowage of the RHIBs, transfer of stores and equipment and, the conduct of RHIB refuelling, troubleshooting and maintenance.

5.6.2 The MSPV MS variant shall be supplied and installed with two (2) RHIBs as detailed at Appendix 1 of the TSOR.

5.6.3 The MSPV MS variant shall be supplied and fitted with one (1) common system or with two (2) identical systems and equipment to launch, recover and stow one (1) port side RHIB and one (1) starboard side RHIB.

5.6.4 The MSPV C&P variant shall be outfitted with the necessary system(s) and equipment to launch, recover and stow one (1) RHIB on the port side using the identical system(s) and equipment as the MSPV MS variant. The MSPV C&P variant RHIB is an additional item listed in Schedule A and is described in the SOW Appendix 2.5.

5.6.5 The MSPV C&P variant shall be configured to accommodate the port RHIB and fitted for but not with either the starboard RHIB or the necessary system(s) and equipment to launch, recover, and stow the starboard RHIB.

5.6.6 If the MSPV C&P starboard RHIB has its own dedicated launch and recovery system, the launch and recovery system, equipment and the starboard RHIB stowage arrangement shall be removable such that the MSPV C&P variant has at least thirty (30) m^2 of continuous open deck space and is able to carry and operate the Crab Trap Hauler, Gill Net Hauler, and removable appliances as noted in paragraphs 5.4.1 above and 5.4.2 above.

5.6.7 One (1) Zodiac RIBO 420, or equivalent, SOLAS rigid hull inflatable rescue boat, shall be supplied and installed on each MSPV. Each rescue boat shall be supplied and equipped with one (1) 4-stroke gasoline outboard engine of 25 Horsepower (HP).

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

5.6.8 Chocks, cradles, gunwale guards and all necessary fittings and support for the stowage of the rescue boat shall be supplied and installed.

5.7 RIGID HULL INFLATABLE BOATS (RHIBS) FUELLING

5.7.1 Twenty five hundred (2500.0) litres of gasoline for refuelling the RHIBs and rescue boat shall be stored on the aft working deck. The gasoline may be stored in one or more baffled tanks. Each tank shall be constructed of non-ferrous metal and shall be equipped with:

a. an automatic pressure and vacuum vent complete with flame arrestor; and

b. a low level, lockable drain valve; and

c. top-mounted, filling and pumping connections complete with lockable isolation valves; and

d. a tank level indicating system; and

e. a top-mounted, removable tank inspection plate; and

f. a save all under the tank; and

g. a lockable, quick release mechanism to jettison the fuel tank(s) overboard in an emergency; and

h. connections to a RHIB and rescue boat refuelling system.

5.7.2 The RHIB and rescue boat refuelling system shall have the following features:

a. be constructed of non-ferrous materials; and

b. be contained within a storage cabinet with lockable doors; and

c. be equipped with a hand operated or pneumatic pump; and

d. be equipped with a grounded flexible hose of an approved rubber material and length to reach the embarked RHIBs' onboard tank filling arrangements; and
be equipped with a hand gun on the end of the flexible hose to allow control of the refuelling operation onboard the RHIBs; and

e. be fitted with a means to ensure there is no build up or dangerous discharge of static electricity during the refuelling operation; and

f. be designed to allow transfer of gasoline from ashore into the onboard RHIB gasoline storage tank(s).

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

5.8 LAUNCH AND RECOVERY SYSTEMS FOR THE RHIBS

5.8.1 The H753 SAR version RHIB launch and recovery system(s) shall be capable of launching and recovering two (2) fully loaded RHIBs containing four (4) occupants per RHIB (weighing a maximum total of 500.0 kg), each fully fuelled, at a speed of 5.0 knots and up to and including Sea State 5 as detailed at Appendix 3 of the TSOR.

5.8.2 The H753 SAR version RHIB launch and recovery system(s) shall be capable of stowing two (2) fully loaded, fully fuelled RHIBs in all conditions in which the MSPV will operate.

5.8.3 For each of the two (2) H753 SAR version RHIBs onboard the MSPV MS variant and the one (1) H753 SAR version RHIB onboard the MSPV C&P variant and the associated fittings, including shackles, webbing, quick release device(s), such as Cranston Eagle Hook, shall be supplied and installed to facilitate the safe launch and recovery of the RHIBs with four (4) personnel embarked. Handling lines, cleats and or stoppers shall be supplied and installed as necessary for RHIB launching, recovery and handling alongside port and starboard. A 6-inch snatch block shall be secured to the head of the launch and recovery system(s) and another 6-inch snatch block shall be secured to an eye on the deck to provide a lead for a diver recovery line.

5.8.4 The launch and recovery systems and stowing arrangements shall not interfere with towing operations.

5.8.5 The launch and recovery systems, stowing and securing arrangements, control stations and power packs and sub-assemblies shall be secured to seating arrangements that are flush-fitted to the deck plate structure. All securing arrangements and bolt patterns required to secure the launch and recovery systems, control stations, power packs and sub-assemblies shall be fitted with stainless steel socket head screws which shall also be flush with the deck plate.

5.8.6 The launch and recovery system controls shall be fitted such that the operator can clearly view the RHIB(s) and rescue boat at all times during the launch, recovery and stowage operations.

5.8.7 The rescue boat shall be able to be manually launched, recovered and stowed in the event of a MSPV power failure.

5.9 DECK TIE DOWNS

5.9.1 Flush mounted deck tie downs, each with a 0.5 tonne (SWL), shall be spaced approximately 1.5 m apart along the entire aft working deck area. The tie downs shall have rolled edges to prevent chaffing of lines.

5.10 LIFTING STRONG POINTS

5.10.1 Lifting strong points shall be designed and installed to facilitate machinery and equipment maintenance, repair and removal.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

5.11 EMERGENCY RESPONSE GEAR

5.11.1 Pallets with Emergency Response Gear for both variants may be loaded on the aft deck. The pallets will be loaded using the deck crane and secured using deck tie-downs. The total weight of all pallets will not exceed three (3) tonnes.

5.12 SIGNAL FLAG LOCKER

5.12.1 A signal flag locker shall be supplied and installed in the Bridge. The signal flag locker shall be sized appropriately to house a complete set of signal flags in individual compartments.

5.13 JACK AND ENSIGN STAFFS

5.13.1 The staffs shall be 1.8 m high and constructed of 50 mm diameter galvanized steel or aluminum pipe.

5.13.2 The jack staff shall be permanently fitted vertically at the stem. The ensign staff shall be removable and raked to 10.0° aft from the vertical on the main deck at the stern. Each staff shall be fitted with two halyard sheaves and cleats.

5.14 GANGWAY

5.14.1 A gangway with a minimum length of 6.5 m shall be supplied. The gangway shall have a clear width of at least 760 mm with an anti-slip serrated tread walking surface to prevent snow and ice accumulation. It shall have permanently fitted rollers at one end and removable railings to facilitate onboard stowage. Eye plates and fittings shall be fitted on the MSPV and to the gangway to secure the safety net beneath the gangway.

5.14.2 Gangway access areas shall be supplied on both port and starboard sides of the main deck of the MSPV.

5.15 PORTLIGHTS AND WINDOWS

5.15.1 Windows and portlights shall be constructed and installed to preserve the watertight and fire-rated integrity of bulkheads and the structure in which they are fitted. All glass shall be heat-treated safety glass.

5.15.2 All portlights shall be at least 450 mm in diameter with deadlights hinged up and the means of retaining deadlights in the "up" position shall be rigid and secure.

5.15.3 Each cabin on or above the main deck shall be supplied and installed with an opening type portlight. Each cabin below the main deck shall be supplied and installed with a non-opening type portlight.

5.15.4 All fixed Bridge windows shall be electrically heated using a vinyl film design for defrosting and de-icing.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

5.15.5 The Bridge front windows, non-drop type, shall be fitted with straight-line wipers and a system to permit de-icing and potable water wash-down. A locally mounted wiper speed controller and ON/OFF switch shall be fitted to each front window.

5.15.6 See-through window films that roll up shall be supplied and installed to reduce sun glare and interior heating while still preserving full visibility.

5.15.7 A minimum of two (2) Bridge front windows shall be weather tight and drop-type opening or raised-type opening. Two (2) side windows, one (1) each port and starboard, shall also be weather tight and drop-type opening.

5.15.8 To reduce reflections from internal lighting, all Bridge windows are to be inclined from the vertical plane top out, at an angle of not less than 10.0° and not more than 35.0°.

5.16 BLACKOUT AND PRIVACY CURTAINS

5.16.1 Blackout curtains shall be impervious to the transmission of any light and shall be installed around all access doors leading to the weather decks. Blackout curtains shall be laced to overhead curtain rails that are fixed stationary to overhead curtain plates. The curtains shall be overlapping and doors shall be fitted with the necessary rods and magnets or Velcro® fasteners to ensure complete blackout conditions when the curtains are closed. Provisions shall be made to secure curtains in the fully opened and fully closed positions.

5.16.2 Blackout curtains shall be supplied and installed at the navigation display, chart table and all entrances to the Bridge. Blackout curtains shall be fitted in the Command Centre to completely exclude light transmission via portlights and windows.

5.16.3 Where deadlights are not installed, black-out curtains with tie backs shall be fitted to completely exclude light transmission from all windows and portlights in cabins, in the mess and in the galley. All house front curtains shall have Velcro® fasteners to hold the curtain against the window.

5.16.4 All cabin doors shall be fitted with privacy curtains so that when the cabin door is secured open with a hook, the curtain may be closed across the door way.

5.16.5 All curtains shall be lined and weighted and shall have top hems of 50 mm and bottom hems of 100 mm. All tops of curtains shall be pleated and shall be at least 150% of the width of the track. All curtains shall extend beyond the deadlight or window or door trim and overlap by 50 mm.

5.17 PROTECTIVE COVERS

5.17.1 Protective covers shall be supplied and installed for the anchor windlass, RHIBs, searchlights, signal lights, floodlights, wire rope and tow rope reels, and other upper deck equipment or lockers requiring protection from the weather. All protective covers shall be made of commercial, marine grade, waterproof coated nylon cloth with stainless steel lacing grommets. Velcro® fastenings and chafing pieces of leather are to be fitted where there are pressure points on the cover.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

5.18 LIFE LINES AND STANCHIONS

5.18.1 In order to facilitate the use of the 0.50 cal heavy machine guns, the main deck forward shall be fitted with removable, coated wire life lines and galvanized steel stanchions. The life lines shall be made taut by means of turnbuckles.

5.18.2 Closed link chain and removable stanchions shall be supplied and installed around all low coamings and flush hatches, and where ever necessary for the protection of personnel. The stanchion supports shall be pocketed.

5.19 DECK PLATES AND GRATINGS

5.19.1 Deck plates shall be aluminum chequered plates, 4.5 mm thick with a raised 4-bar pattern non-skid type surface. Individual deck plates shall not be greater than one (1) m^2 for ease of lifting and removal. Deck plates shall be constructed in accordance with Class.

5.19.2 Deck plates shall be firmly secured to steel angle bar ledges with counter sunk and stainless steel threaded socket head screws. Securing arrangements shall not extend above the surface of the grating and deck plating.

5.19.3 Piano hinged sections of deck plates or gratings shall be fitted in areas where access is required below them to carry out operation and periodic inspection, maintenance and cleaning of equipment.

5.19.4 All grating panels shall be secured to the supporting framework by clips or bolts to ensure positive locking and ready disassembly. Clips and J-bolts shall not extend above the surface of the grating.

5.20 STRUCTURAL BULKHEADS, DOORS AND PARTITIONS

5.20.1 All fire doors shall be fitted with magnetic hold backs. All non-fire doors shall be fitted with suitable non-rattling holdbacks.

5.20.2 All watertight doors and hatches shall have open and closed indicators located on the Bridge.

5.20.3 All accommodation doors shall be supplied and installed with kick-out panels.

5.20.4 Exterior access to the Bridge shall be by means of supplied and installed port and starboard weather tight doors. The door windows shall be fixed and the doors shall be supplied and installed with a four (4) point single lever dogging arrangement. The Bridge doors shall have keyed dead bolt locks and shall be keyed-to-like.

5.21 NAME PLATES, NOTICES AND MARKINGS

5.21.1 Bilingual label plates for compartments, warnings, ventilation, lifting appliances, exits, means of escape, life saving appliances, fire-fighting, damage control, and safety related items and equipment shall be made using an aluminum metal photo process.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

5.21.2 Self-adhesive safety labels and markings within compartments, warning signs, exits, life-saving appliances, fire-fighting, damage control, and other safety related items and equipment shall be in accordance with International Maritime Organization (IMO) A 603(15) 7 Standard Symbols.

5.22 IMMERSION SUITS STORAGE

5.22.1 Allocated lockers with storage space for eighteen (18) Transport Canada Marine Safety (TCMS) approved immersion suits shall be provided as follows: one (1) immersion suit in each cabin for each occupant and two (2) immersion suits in both the Bridge and in the MCR.

5.23 LIFE PRESERVERS

5.23.1 Eighteen (18) TCMS approved life preservers shall be supplied and installed. Allocated storage space shall be supplied and installed as follows: one (1) life preserver in each cabin for each occupant and two (2) life preservers in both the Bridge and in the MCR.

5.24 JACOB'S LADDERS

5.24.1 Two (2) Jacob's ladders shall be supplied and installed on each MSPV. The Jacob's ladders shall reach the waterline with at least two rungs submerged when secured on either side of the vessel from the highest point of the main deck edge at the MSPV's arrival condition in salt water.

5.25 PAINTING AND PRESERVATION

5.25.1 The exterior hull and deckhouse plating of the MSPV shall be painted in accordance with standard Canadian Coast Guard colours as detailed in Fleet Circular - Canadian Coast Guard Identity Colour Standard –CF-08-2007 and Canadian Coast Guard Identity Program TP-4011.

5.25.2 The MSPV shall be fitted for, but not with, removable markings to be provided by Canada as required by CCG and the RCMP for identifying the MSPV MS variant.

5.26 DECK COVERINGS

5.26.1 Deck coverings shall be installed as shown in Table 2 – Deck Coverings.

AREA	FINISH
Bridge and Command Centre	shock absorbing rubber
Cabins and Mess	vinyl flooring or tiles on underlay
Galley	3 inch x 3 inch or metric equivalent non-slip type ceramic tiles on underlay
Washrooms, Wet Gear Locker & Laundry	"Terrazzo Reversa Tile" or similar quality slip resistant tile on underlay
Switchboards, UPS, control consoles	Switchboard Mat; ASTM 30,000 Volt Dielectric Rated Standard in accordance with IEEE 45-2002, Standard Specification for Rubber Insulating Matting.
Exterior Deck	non-slip high performance paints

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Passageways	12 inch x 12 inch or metric equivalent non-slip asbestos-free vinyl tile on underlay
Tank top if used for working area	perforated rubber matting

TABLE 2 - DECK COVERINGS

5.26.2 Deck coverings fitted in galley, showers and laundry areas shall be contoured to ensure proper drainage to scuppers.

5.27 FIREARMS AND AMMUNITION

5.27.1 The MSPV shall be designed and built to be fitted-for-but-not-with two (2) 0.50 calibre heavy machine guns. The main forward deck in way of the port and starboard mount locations for the two (2) 0.50 calibre heavy machine guns shall be strengthened for the firing loads.

5.27.2 The firearms locker shall be designed and built so that the following firearms can be stored. The stowage arrangement shall be designed and built to meet the requirement of Canadian Coast Guard National Firearms Policy (Doc #817221v5).

a. Three (3) – Long Rifles; and

b. Three (3) – Long Rifle Scopes; and

c. Three (3) - Shot Guns; and

d. Two (2) – 0.50 cal heavy machine guns without barrels; and

e. Three (3) – 0.50 cal heavy machine gun barrels.

5.27.3 The firearms locker shall be fitted with two (2) independent locking devices.

5.27.4 The MSPV's firearms locker shall be located inside on the main deck level.

5.27.5 A secure locker shall be supplied and installed in the Captain's Cabin for stowage of all the breech blocks for all the firearms noted above.

5.27.6 RCMP and C&P personal firearms shall be secured in lockers located in each cabin as specified in the cabin outfit.

5.27.7 Two (2) lockable watertight ammunition lockers shall be supplied and installed on the main deck, one (1) port and one (1) starboard, with appropriate capacity for each to hold 1000 rounds for the 0.50 cal heavy machine guns.

5.27.8 One (1) lockable ammunition locker, separate and apart from the 0.50 cal heavy machine gun ammunition stowage lockers, shall be supplied and installed inside on the main deck level so that the following ammunition can be stored:

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

a. Long Rifle: TBD (200 rounds); and

b. 9mm pistol: 9mm (2000 rounds); and

c. Shot Gun: TBD (250 rounds).

5.27.9 All ammunition lockers shall be fitted with a fixed fire-fighting system.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

This page left intentionally blank.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

6 PROPULSION

6.1 GENERAL

6.1.1 All controls for operating the machinery, equipment, instruments, pumping systems, cocks, air pipes, inlets, sounding pipes, switches and associated items shall be permanently marked with bilingual, mechanically-fastened, engraved plates of plastic or corrosion resistant metal, clearly showing their purpose. All hand-wheels shall be marked to show the direction of closure. Valves shall have brass label plates securely attached to them in accordance with ASTM F99-86(2006) Standard Specification for Valve Label Plates.

6.1.2 All portions of exhaust pipe surfaces and other hot surfaces which could be a hazard to personnel shall be properly insulated so that the surface temperature does not exceed 60.0°C or otherwise shall be protected to prevent accidents or burns.

6.1.3 All fuel discharge lines shall be double-walled.

6.2 MAIN ENGINES

6.2.1 All main engines shall be supplied and installed. Every engine shall be a non-reversible, self contained, turbo-charged, after-cooled, four cycle marine diesel engine. Every main engine shall meet the requirements as stated in CSA 2001 -Main Machinery Regulations Schedule IV Part II Plans Division I Internal Combustion Oil Engines.

6.2.2 The main engines shall be capable of operation on high output diesel single-or multi-grade commercially available (API/SAE graded) lubricating oil. Each diesel engine shall have its own OEM supplied pre-heater and pre-lube pump and its own lube oil, fresh water-cooling and raw water system. There shall be no interconnection between the engines' lube oil, fresh water and raw water systems although the raw water systems may be connected to a common sea chest.

6.2.3 Each engine shall be supplied and installed with all accessories recommended by the OEM for continuous service at sea.

6.3 GEARING, SHAFTING, BEARINGS

6.3.1 Each main engine shall be connected to a separate gearbox in accordance with the OEMs recommended method. Coupling bolts shall be supplied and installed with locking devices. The gearboxes shall be identical except that they shall be configured such that the propellers have opposite rotation. Propellers shall have rotation such that the propeller blades will rotate outboard over the top for ahead propulsion.

6.3.2 Stern tube bearings shall be water cooled. To permit operation in shallow waters, a filtration device shall be supplied and installed on the water supply to the bearings.

6.3.3 The stern tube mechanical watertight seal shall be readily accessible to allow for checking and replacement of wearing elements without shaft disassembly and with the MSPV afloat.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

6.3.4 Means shall be supplied and installed to prevent propellers from being fouled by ropes up to and including 2.0 cm in diameter.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

7 AUXILIARY SYSTEMS

7.1 PUMPS

7.1.1 All pumps shall be supplied, installed and fitted with mechanical seals. The pump casings and impellers shall be stainless steel or naval bronze, and all shafting shall be constructed of stainless steel. Pumps handling black and grey water, fuel, and lubricating oils shall have drip trays or save-alls installed to contain possible leakage. All pump configurations shall be standardized where pumping requirements are the same or similar.

7.1.2 All instrumentation for machinery, pumps, piping and mechanical systems shall display readings in the international system of units (SI). Instrumentation shall be installed to ensure the safe and proper operation of equipment and systems.

7.2 PIPING SYSTEMS

7.2.1 Piping systems shall be designed and installed to afford access to valves, manifolds, strainers, filters and other items incorporated in the systems requiring periodic servicing. Duplex filters with changeovers shall be fitted in critical systems for the purpose of enabling cleaning without disturbing the normal functioning of the systems. Where piping is attached to resiliently mounted machinery, rotating flange expansion joints or 321 stainless steel braided flexible hoses with ridged male and swivel female couplings shall be used.

7.2.2 Mechanical joints shall be avoided and only used where absolutely necessary to allow for maintenance. Pipe runs shall be engineered to ensure no interference with equipment access for maintenance and operation. All piping carrying potable water and raw water shall be supplied and installed with drain plugs to allow complete drainage by gravity for maintenance. All piping arrangements shall be designed and installed to avoid air pockets. Where piping systems are inherently prone to air pockets by design, piping shall be fitted with threaded spigots or vent plugs. All joints shall be either welded or brazed sleeved. All pipe sections shall be thoroughly cleaned and be free from oil, dirt, rust, weld splatter and all other foreign matter prior to installation. After installation, all piping systems shall be flushed and blown clear, to be proven free of oil, dirt, rust, weld splatter and all other foreign matter or contaminant prior to putting into service.

7.2.3 Valves shall be suitable for the intended application and shall be readily accessible for inspection, operation, maintenance and removal. Sandwich-type, butterfly valves shall not be used to provide watertight integrity between any system and the ship's hull. Where possible, all valves shall be grouped in a manifold. Valves that are not readily accessible shall be fitted with fixed extension spindles upon approval by Canada.

7.2.4 Piping systems shall be identified in accordance with the Colour Coding Standard for Piping Systems CCGS 30-000-000-ES-TE-001.

7.2.5 Valves shall have bilingual brass label plates securely attached to them in accordance with ASTM F99-86(2006) Standard Specification for Valve Label Plates.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

7.2.6 All potable water (hot and cold), raw water, ballast water, black and grey water, sanitary water and refrigerant piping throughout the MSPV shall be insulated, however, the raw water, ballast water and black and grey water piping and potable water filling pipes in the machinery space(s) shall not be insulated. Where piping passes through a tank, a void, or a cofferdam there is no requirement to insulate the pipe. Insulation on valves shall be arranged to permit easy removal and replacement of insulation without disturbing pipe insulation.

7.2.7 All deck-filling and pump-out connections shall be lockable and located to permit use when the MSPV is moored both port and starboard side to. All fuel oil, waste oil, lubrication oil, and black water connections shall be fitted with a save-all.

7.3 FUEL OIL SYSTEM

7.3.1 Notwithstanding the overall intent to design, build, outfit and certify to Lloyd's Register Rules and Regulations for the Classification of Special Service Craft, or equivalent, the MSPV shall be designed, built and outfitted with a fuel oil system allowing storage, transfer, treatment, cleaning, supply, use and discharge of the appropriate fuel in accordance with OEM requirements and in accordance with Lloyd's Register Rules and Regulations for the Classification of Ships Chapter 14 Section 2, 3, and 4, or equivalent.

7.3.2 The transfer pump(s) shall be supplied and installed to allow transfer of diesel fuel to, or from, or between, any of the diesel fuel oil storage tanks via duplex filter(s) and water separator(s) to all of the day and service tank(s), or directly to a deck connection(s) to de-fuel.

7.3.3 The following requirements shall apply to the fuel system:

a. two (2) diesel filling stations shall be located on the main deck one (1) starboard and one (1) port. Alternatively, one (1) central filling station that is accessible from both sides of the MSPV is acceptable; and

b. one (1) simplex coarse strainer shall be supplied and installed in the main fuel line at each filling station; and

c. bronze lockable closing caps and connections shall be supplied and installed on each filling connection; and

d. each fuelling station shall be supplied and installed with a means of communication with the Bridge, Main Machinery Room (MMR) and MCR.

7.3.4 All fuel tanks shall have access for internal examination and cleaning and shall be fitted with sounding tubes on the main deck level.

7.4 LUBRICATING OIL SYSTEM

7.4.1 All lubricating oils shall be the same for similar equipment, subject to the approval of the OEM.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

7.4.2 The lubricating oil transfer system shall allow transfer of oil from storage tank(s) to the diesel sumps. If the same grade of lubricating oil is approved for main engines, gear boxes and generator engines, the minimum capacity of the storage tank(s) shall include one (1) complete oil change of one (1) main engine, one (1) gear box and one (1) generator engine and all bearing(s), plus 20%. If more than one lubricating oil type is used, the capacity of the tanks shall be as follows:

a. 1.2 times the quantity required for one main engine; and

b. 1.2 times the quantity required for one gear box; and

c. 1.5 times the quantity required for one generator engine.

7.4.3 The dirty oil tank(s) shall be capable of holding all the oil removed during one complete oil change. A complete oil change comprises one main engine, one gear box, one generator engine and all bearing(s) plus 20%. The dirty oil tank(s) contents shall be capable of being discharged to shore through a deck connection(s) by means of an electrically driven pump.

7.4.4 Tank(s) that supply make-up oils for engines shall be of the type, capacity and general location as recommended by the OEM. Tank(s) in the system shall be built and installed with approved oil level indicators, sounding tubes, filling pipes, vent pipes, manholes, cleanout holes, and all necessary connections and fittings. The storage tank(s) shall have a lockable drain valve(s) and suitable save-all(s).

7.4.5 At the lube oil filling station(s) on the main deck there shall be sufficient deck area to store a standard forty-five (45) gallon drum or metric equivalent. The filling line(s) to the storage tank(s) shall be fitted with a fine mesh strainer with removable element and drain.

7.4.6 The lubricating oil storage tank(s) shall have a rundown valve and distribution line terminating at a stop valve convenient to each main propulsion engine, generator engine and each gearbox. A length of quick connecting flexible hose terminating in a spring-loaded cock or nozzle shall be used to introduce oil into the engine sump. An electric pump, with a hand pump in parallel, shall be supplied and installed for supplying oil(s) to diesel sumps and gearboxes.

7.4.7 The transfer system for diesel engine and gearbox clean lubricating oil(s) shall be segregated from the dirty oil system.

7.5 DIESEL ENGINE COMBUSTION AIR INTAKES AND EXHAUSTS

7.5.1 Combustion air shall be conditioned to supply air in accordance with the OEM's recommendations in all environmental conditions noted in Table 1 of the TSOR.

7.5.2 The installation of the diesel exhaust system(s) shall comply with both the OEM's recommendations and the Class acoustic requirements for maximum noise reduction. Each engine outlet shall be supplied and installed with a stainless steel expansion bellows which shall be installed as recommended by the OEM. Piping and silencers shall be secured to accommodate thermal expansion and motion of the engines. The exhaust systems shall be installed with supports to minimize loading of the flexible connections and expansion joints, and be effectively isolated

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

from the ship's structure. Flexible sections shall be installed at the engine exhaust outlets to facilitate engine maintenance including engine mounts and vibration isolators.

7.5.3 The exhaust gases from each engine shall exit through a spark-arresting exhaust silencer, complete with clean-out ports, drain pot, drain line and valve.

7.5.4 The exhaust system shall not run through habitable spaces and shall be designed and built such that it does not interfere with the aft working deck area, specifically the boat launching and recovery operations, and be streamlined to reduce air drag. Arrangements shall be supplied and installed to prevent spray and all water ingress into the exhaust system.

7.6 COMPRESSED AIR SYSTEM

7.6.1 A compressed air system shall be used for engine starting. The compressors shall be supplied and installed with provision for making one compressor as lead and another compressor as lag. Drains shall be led to an outlet near deck plate level and piped via a "Pig's Ear" back to the oily bilge water tank, if fitted.

7.6.2 A compressed air system shall be fitted to provide a compressed air supply for power hand tools. The system shall provide a minimum of 140.0 l/m @ 6.2 bar from a self contained compressor and air receiver. Air outlets shall be fitted with shutoff ball valves and spring-loaded quick-connect female couplings. A quick connect air hose of 15 m minimum length complete with one (1) male and one (1) female quick connect coupling shall be supplied and installed at the following locations:

a. MMR; and

b. Main deck at forward and aft ends of main deckhouse; and

c. Deck workshop; and

d. Steering Gear compartment; and

e. If fitted, Auxiliary Machinery Room (AMR).

7.7 FIREMAIN SYSTEM

7.7.1 The firemain system shall be normally dry. The firemain shall be supplied and installed with drains at suitable points to ensure that the system can be completely drained.

7.7.2 An international shore connection shall be supplied and installed.

7.7.3 Cooling of auxiliary systems using firemain water shall not be permitted under any circumstances.

7.7.4 The firemain shall be used to provide a wash-down for the anchor and anchor chain. A means of draining the firemain directly overboard after the wash-down shall be included.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

7.7.5 Fire pumps shall have the capability of being operated both locally and remotely.

7.8 SEA CHESTS AND SEA BAYS

7.8.1 To avoid ice accumulation in sea chests and sea bays Transport Canada Ship Safety Bulletin No.08/1989 shall be adhered to.

7.9 STEERING SYSTEM

7.9.1 The rudder bearings must be of the self-lubricating type.

7.9.2 The rudders shall be capable of being individually locked in the mid-ship position. Each rudder shall be capable of being worked from each of the steering operating stations over the full range of 35.0° port and starboard while the other rudder is locked mid-ships

7.9.3 A hand-operated emergency steering gear pump and associated piping and valves shall be supplied and installed in the Steering Gear compartment. This pump shall be operable by one (1) person and capable of moving both rudders to any desired position within the working range without disconnecting any part of the steering gear.

7.9.4 The MCS in the Bridge shall be fitted with a steering wheel. The other control stations should utilize steering wheels or joysticks. Each control station shall have a take-over switch and rudder angle indicators which shall be back-lit with dimmers.

7.9.5 It shall be possible to steer the MSPV from each control positions using a follow-up and a non-follow-up system.

7.10 REFRIGERATION SYSTEMS

7.10.1 All refrigerants that are currently scheduled to be phased out of use within the design life of the MSPV shall not be used in MSPV refrigeration systems. The refrigeration systems shall utilize an approved refrigerant and shall be fitted with all components necessary for successful and safe operation of the system when utilizing that refrigerant.

7.10.2 Two (2) identical co-located refrigeration units shall be supplied and installed. The units shall be raw water cooled and shall have identical but separate control and auxiliary systems. Each unit and its associated system components shall be sized so that they are individually capable of initially achieving and then maintaining the required temperatures simultaneously in the refrigerated rooms. The temperatures of the refrigerated rooms shall be monitored locally and through the Centralized Control, Alarm and Monitoring System (CCAMS) which shall be set to alarm when the temperature is +/- 2.0° C outside the required range.

7.10.3 The required temperature ranges are:

a. Freezer (cold) Room: -18.0°C to -15.0°C; and

b. Refrigeration (cool) Room: 3.0°C to 5.0°C.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

7.11 HEATING VENTILATION AND AIR CONDITIONING (HVAC)

7.11.1 Accommodation spaces, including the Bridge, Command Centre, MCR, Galley and common areas, shall be supplied and installed with heating, ventilation and air conditioning (HVAC). The HVAC system(s) shall provide the following:

a. Heating (not less than 19.0°C under winter conditions listed in Table 1); and

b. Cooling (not more than 22.0°C under summer conditions listed in Table 1); and

c. humidification; and

d. dehumidification; and

e. required number of air changes.

7.11.2 Air-conditioning fans shall be capable of being used as ventilation fans when spaces are not being heated or cooled.

7.11.3 The HVAC system shall be designed and built with a 20% makeup fresh air supply.

7.11.4 The HVAC system shall meet the following requirements:

a. upper deck louvered openings should be directed aft and protected from the weather; and

b. non-return dampers shall be mounted in the discharge ducting of each exhaust fan; and

c. HVAC intakes shall be located to prevent short-circuiting of all exhaust gases.

7.11.5 Manual dampers shall be supplied and installed in HVAC trunking to isolate ventilation in case of fire and in suitable locations to permit system balancing.

7.11.6 Dampers in the HVAC trunking at watertight boundaries shall be supplied and installed with fusible links to isolate the HVAC system in case of fire.

7.11.7 Primary heating shall be by means of electric heating elements in the HVAC system augmented by local, individual, fixed electric space heaters.

7.11.8 Non air-conditioned spaces, such as workshops and storage spaces, shall be locally heated, cooled and ventilated with local temperature controls. Minimum temperatures shall be 10.0°C in storage spaces and 19.0°C in workshops.

7.11.9 Air vents shall be placed such that they do not blow directly on workstations or berths. Air vent exit air velocity shall as a minimum meet the specified air change rate, Table 3, and shall not exceed 2.5 m/s. The 2.5 m/s air velocity maximum does not apply to unattended machinery spaces. Ventilation trunking shall be accessible and designed and built for efficient cleaning.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

7.11.10 Machinery spaces shall be independently heated, cooled, and ventilated. Local controls for each of the spaces shall be supplied and installed.

7.11.11 All fans and air-conditioning units shall be resiliently mounted.

7.11.12 No part of the ship's structure shall be used as air ducting for the HVAC system.

7.11.13 Intake fans shall be fitted with silencers to minimize noise transmission to the machinery space and to the working deck area.

7.11.14 The required air changes shall be as listed below in Table 3 – Air Changes.

SPACE	# of air changes/hour
MMR	20 (minimum)
Auxiliary Machinery Room(s), if fitted (AMR)	20 (minimum)
Garbage Handling Room	30
Sewage Treatment Room	30
Toilets and Washrooms	30
Wet Gear Locker	20
Paint locker and other storage spaces	10
Accommodation spaces	20
Galley	20

TABLE 3 - AIR CHANGES

7.11.15 The temperature in machinery spaces shall not exceed 50.0°C with all the machinery operated at full power or full load nor fall below 10.0°C in all machinery states.

7.11.16 There shall be a minimum of two (2) air changes per hour when the vessel is in hot lay-up.

7.11.17 Washrooms, including toilets, and the galley shall have separate exhaust systems from those used for accommodation spaces. The galley exhaust system trunking shall be designed, built and installed with access ports to facilitate in-situ internal cleaning.

7.11.18 The following compartments shall have natural supply and mechanical exhaust:

a. central store; and

b. washrooms; and

c. laundry; and

d. workshops; and

e. garbage handling room; and

f. sewage treatment room; and

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

g. paint locker; and

h. Wet Gear locker.

7.11.19 Ventilation shall be supplied and installed for the fore peak compartment.

7.11.20 The main and auxiliary machinery spaces shall be served by variable speed supply and exhaust fans.

7.11.21 Insulation and vapour barrier shall be applied to the ducting and equipment to ensure minimum acceptable heat loss or gain and to prevent condensation. Metal sheathing shall be supplied and installed in areas where insulation may be subject to damage.

7.12 POTABLE WATER SYSTEM

7.12.1 The potable water system comprises the equipment used for embarking, producing, testing and treating, heating, cooling, storing and distributing potable water. The potable water system shall be fitted with two (2) reverse-osmosis type potable water makers each capable of producing a no less than 150.0 litres (l)/hour (hr) of potable water, from sea water and fresh water at a minimum temperature of 5.0°C. The system shall be fitted with a minimum of two (2) stainless steel storage tanks capable of storing a no less than the total volume of 6,300.0 l of potable water, based on a consumption rate of 150.0 l/day/person x 3 days x 14 persons.

7.12.2 The potable water system shall be designed and built to comply with:

a. Guidelines for Canadian Drinking Water Quality and the Guideline Technical Documents, as published by Health Canada; and

b. Canadian Coast Guard (CCG) Fleet Safety and Security Manual Section 7 – Potable Water Quality; and

c. Potable Water Regulations for Common Carriers, C.R.C., c. 1105, as published by Health Canada.

7.12.3 The potable water system shall be designed, built and installed to comply with NSF/ANSI Standard 61 Drinking Water System Components – Health Effects.

7.12.4 Each potable water storage tank shall be fitted with: a vent, a drain, a salinity monitor, a connection to each of the reverse-osmosis type potable water makers, a connection to a common upper deck filling station, a connection to the potable water distribution system, a tank inspection access opening and, connections for sampling, and treating tank contents. Each tank shall have tank level sensor alarms integrated into the CCAMS. The alarms shall also be displayed on a local control panel. The potable water makers shall be able to be started and stopped manually from a local control panel and remotely from the MCS. Each water maker shall be fitted with a salinity monitor and an automatic dump valve or shut down control.

7.12.5 The cap on the fill connection shall be padlocked and a bilingual label plate stating "Potable Water Only" shall be installed at the fill valve and connection. Every outlet used for

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

drinking and culinary purposes shall be supplied and installed with a filter(s) capable of removing suspended solids down to one (1.0) micron and shall have a bilingual plate affixed stating the water is safe for drinking and culinary purposes.

7.12.6 Potable water shall be distributed to the:

a. cabin sinks; and

b. lavatory sinks; and

c. showers; and

d. galley; and

e. mess; and

f. chilled-water drinking fountains; and

g. laundry; and

h. sanitary flushing system; and

i. MCR; and

j. MMR; and

k. Bridge; and

l. Command Centre; and

m. Bridge window wash-down system; and

n. wet gear locker; and

o. garbage handling room; and

p. deck workshop; and

q. all other systems or locations that require potable water.

7.12.7 Water heaters shall be equipped with temperature regulating devices to maintain the hot water temperature at 60.0°C. Temperature and pressure sensors shall be integrated into the alarm and monitoring system and shall be displayed on a local control panel as well as the CCAMS. Should the internal tank temperature reach 66.0°C or the tank pressure exceed the OEM's recommended pressure setting, power to the water heater shall be cut off and an alarm shall be activated.

7.12.8 All hot water piping and flanges shall be insulated to minimize heat losses and ensure personnel safety. All cold water lines and flanges shall be insulated to minimize heat gain and to

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

prevent condensation. Hot and cold water piping in shower enclosures shall be installed behind the paneling to ensure personnel safety. Isolating valves shall be fitted at each hot and cold branch from the main system and at each fixture.

7.13 BLACK, GREY WATER AND SANITARY FLUSHING SYSTEMS

7.13.1 The MSPVs shall be fitted with marine-type sanitary flushing and vacuum collection systems capable of collecting black water in a collection tank(s). Grey water shall be handled and collected separately from the black water system using a gravity-type system capable of collecting grey water in a collection tank(s). The black water tank(s) shall be sized to store a no less than 420 l of black water. The grey water tank(s) shall be sized to store a no less than of 3,780 l of grey water.

7.13.2 The grey water system shall be designed and built to transfer grey water collected in the grey water collection tank(s) either directly overboard or to the black water collection tank(s). The grey water system shall be designed to prevent black water from contaminating the grey water system.

7.13.3 The black water system shall be designed and built to transfer black water collected in the black water collection tank(s) to an IMO MEPC.159(55) certified sewage treatment plant (STP) for discharge of the treated effluent overboard or, additionally, to transfer untreated black water to a standard IMO MARPOL deck shore connection.

7.13.4 The STP shall be capable of treating influent streams containing black water only and black and grey water combined containing fresh water and salt water. The STP shall be capable of providing continuous operation for complement of between eight (8) and fourteen (14) persons while meeting the treated effluent discharge requirements specified in IMO MEPC.159(55). The grey and black water tank level indicators and, high and low sensor alarms shall be integrated into the CCAMS and shall be displayed on a local control panel. The influent piping immediately prior to the STP and the outlet piping immediately prior to the overboard discharge shall each contain a sampling valve to allow for the collection of influent and effluent samples, respectively.

7.13.5 The black water and grey water collection, discharge, and treatment system(s) shall be capable of full automation with the ability to be operated locally and remotely from the MCS.

7.13.6 Hydrogen sulphide (H_2S) sensors shall be supplied and installed in the black and grey water tank spaces as well as the STP space. The sensor shall monitor the level of H_2S in the spaces and provide an audible alarm in the space as well as providing an alarm to the CCAMS when a H_2S level exceeds set limits.

7.14 FIRE DETECTION, EXTINGUISHING AND FIREFIGHTING SYSTEMS

7.14.1 Each MSPV shall be equipped with fire detection system(s), fire-extinguishing systems, and a fire plan.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

7.14.2 The MMR and, if fitted, the AMR fixed fire-extinguishing systems' extinguishing agent shall be located outside of the protected space with direct access to an open deck and shall be capable of local actuation.

7.14.3 The galley exhaust hood, trunking, and cooking appliances requiring automatic protection shall be fitted with approved fire-extinguishing systems which shall also be capable of manual activation from outside the galley. The system shall meet the requirements of the Underwriters Lab ULC / ORD-1254.6-1995 Fire Testing of Restaurant Cooking Area Fire Extinguishing System Units.

7.15 PORTABLE FIREFIGHTING EQUIPMENT

7.15.1 Portable fire fighting equipment shall be supplied and installed.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

This page left intentionally blank.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

8 ELECTRICAL

8.1 POWER SUPPLIES

8.1.1 The MSPV shall be supplied and installed with the following:

a. Primary power shall be 600 volts AC, 3-phase, 3-wire insulated, 60 Hz, ungrounded delta connected; (this does not exclude the option of a high resistance ground to limit available fault current if required); and

b. All Alternating Current (AC) voltages for power distribution shall be 60 Hz frequency; and

c. The emergency source of electrical power shall be a diesel driven generator. It shall be capable of automatically assuming the emergency switchboard load within 45 seconds after failure of the normal electrical power source; and

d. Backup power shall be supplied and installed to power computer systems and peripherals, machinery control, alarm and monitoring and other vital systems as required. There shall be an automatic, no-break battery back up. Where an Uninterruptible Power Supply (UPS) is selected, refer to paragraph 8.8.3 below.

8.1.2 Apparatus containing transistors, diodes and other solid-state devices shall be internally or externally supplied with protection against voltage transients or surges caused by load switching, fault or failures of the MSPV power systems.

8.2 GENERATORS

8.2.1 The MSPV shall have normal electrical power supplied by at least two identical, independent, diesel engine driven ship service generating sets, rated 600 volts AC, 3-phase, 3-wire insulated, 60 Hz at 0.8 PF at a 50.0°C ambient temperature, and arranged for continuous parallel operation of the units when required.

8.2.2 The generators shall be rated such that either one can continuously supply the peak cruising load at sea plus transient loads, with an allowance for 20% future growth. The ship's service standby generator set shall be capable of automatically assuming the ship's service electrical load within thirty (30) seconds after the failure of the on-line generator.

8.2.3 Each engine shall be a non-reversible, self contained, turbo-charged, after-cooled, four cycle marine diesel engine and shall have a normal continuous capacity at its marine rating and shall be capable of meeting the rating of its generator.

8.2.4 All fuel discharge lines shall be double-walled.

8.2.5 Diesel engines shall be capable of operation on a high output diesel single or multi-grade commercially available (API/SAE graded) lubricating oil. Each diesel engine shall have its own OEM supplied pre-heater and pre-lube pump and its own lube oil, fresh water-cooling and raw

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

water system. There shall be no interconnection between the engines' lube oil, fresh water and raw water systems although the raw water systems may be connected to a common sea chest.

8.2.6 Each generator-engine set shall be supplied and installed with all accessories recommended by the OEM for service at sea in all conditions specified in Table 1 and shall be installed complete with all attached and unattached auxiliaries.

8.2.7 Each generator and its engine shall be installed on a common rigid frame that is suitable for resilient mounting.

8.2.8 Each ship service generator and the emergency generator shall be supplied and installed with a minimum of one imbedded temperature detector per phase to allow the monitoring of the winding temperatures at the appropriate switchboard section and also by the CCAMS. In addition, an automatic insulation resistance monitor shall continuously monitor each ship service generator's and the emergency generator's stator insulation leakage to ground and shall initiate an alarm at the CCAMS at values of one (1) megohm or less.

8.3 SHORE CONNECTIONS

8.3.1 The shore power isolation transformer shall be one (1) – 3 phase, 600 V: 600 V, dry type transformer. The transformer shall incorporate an electrostatic shield. Taps shall be supplied and installed on the primary side of the transformer as follows:

a. Two (2) capable of increasing voltage 2.5% above normal full capacity; and

b. Two (2) taps capable of decreasing voltage 2.5% below normal full capacity.

8.3.2 A 30 m interconnecting 3 phase 4 wire cable suitable for 600 V 200 amp service fitted with two male plugs at each end of the cable with either CROUSE-HINDS AR2042 or APPLETON ADR20034 plugs for the shore-to-ship connection, shall be supplied and installed. A stowage reel, weatherproof caps for the plugs and weatherproof covering for the cable and reel shall be supplied and installed for onboard storage.

8.3.3 Watertight shore connection capability, located on the weather deck and readily accessible to shore power from both sides, shall be supplied and installed. The shore connection box(es) shall be at least 0.5 m above the deck and shall be located in weather protected area(s) to ensure the portable supply cable does not impede weather deck walkways or interfere with deck activities on both the port and starboard sides. Nameplate(s) shall be supplied and installed to clearly identify the connection box(es). A warning plate instructing personnel to isolate all supplies prior to working within the enclosure shall also be supplied and installed on every connection box.

8.4 SWITCHBOARDS

8.4.1 The generator and distribution switchboards shall be arranged for operation of generator circuit breakers and for distribution of power throughout the MSPV.

8.4.2 Bus bars shall be marked A, B, C to identify each of the three phases.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

8.4.3 All switchboards shall be supplied and installed with fluorescent canopy lighting under the front, and back if access is required, drip-shields. Front and rear lighting shall be individually switched.

8.4.4 Two (2) of each distribution breaker frame size shall be supplied and installed within each switchboard and shall act as spares.

8.4.5 Each switchboard circuit breaker shall be of the draw-out type. Lifting and handling equipment shall be supplied for the removal of the circuit breakers from the switchboards.

8.4.6 In addition to manual paralleling capability, all generator combinations shall be supplied and installed with automatic paralleling capabilities.

8.5 DISTRIBUTION PANELS

8.5.1 All distribution panel bus-bars and connectors shall be made of copper. Distribution panels shall be from the same manufacturer and shall be supplied and installed with lockable doors. All locks shall be keyed alike and the quantity of keys to be supplied shall be equal to the number of locks supplied and installed.

8.5.2 Each distribution panel shall also be supplied and installed with four (4) blanked, double-pole circuit breaker spaces, to allow for future growth as well as four (4) spare circuit breakers that are representative in amperage of what is installed in the panel.

8.6 ELECTRICAL CABLES

8.6.1 All cable shall be low smoke, zero halogen and, unless otherwise required, unarmoured. All cables shall have an insulation rating of at least 85.0°C.

8.6.2 All cables shall be designated by an identification number that shall be permanently marked on non-ferrous metal tags, securely affixed to each end of the cable run in each main compartment and subdivision and, on both sides where passing through decks and watertight bulkheads.

8.6.3 Cableways and cables shall be installed clear of machinery access routes and maintenance envelopes. The strength and watertight integrity of the decks and bulkheads shall not be affected by the installation of the cable penetrations. Upon MSPV delivery, a minimum of 10% spare space shall be available in all cableways and deck and bulkhead multi-cable penetrations.

8.6.4 All cables supplying power to equipment, fixtures and electrical apparatus exposed to the weather shall be run internal to the ship's hull and superstructure as much as practicable. Where unavoidable, or where the length of the cables exposed to the weather exceeds one (1) metre, the cable selected shall be of a type that includes basket weave bronze braid armour covered with an external impervious non-metallic jacket.

8.6.5 To minimize EMI, spacing between cables shall conform to CCG Standard 70-000-000-EU-JA-001, or where this is not practical, additional approved shielding shall be supplied and installed, except where entering associated equipment, or where cables cross at a 90° angle.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

8.7 MOTORS AND CONTROLLERS

8.7.1 All motors shall be totally enclosed fan cooled while those installed on deck exposed to weather shall be watertight to NEMA 4X.

8.7.2 All motors greater than one (1) HP shall be suitable for 575 volt, 3-phase, 60 Hz operation, and rated for continuous duty, with Class F insulation, and equipped with anti-friction, factory sealed pre-lubricated ball bearings.

8.7.3 Grouping of motor controls in Motor Control Centres (MCC) centralized in proximity to the source of supply, the main or emergency switchboards, is a requirement and shall be maximized. MCC bus bars and connectors shall be made of copper. Starter units shall be draw-out type, and shall include an incoming circuit breaker. Reduced voltage starters, where required, shall be solid state type. Starter front covers shall include shrouded start and stop pushbuttons and run and stop indicating lights.

8.7.4 Individual motor starters and controllers shall be mounted within line of sight of the auxiliary they serve. They shall be supplied and installed with local control and indicating lights. Local control shall be mounted in drip proof enclosures. An overload/reset button shall be supplied and installed on the enclosure door of each motor controller unless the operation of the auxiliary necessitates remote reset. Indicating lights mounted in the enclosure door shall notify the operator of equipment status. A complete wiring diagram of each controller shall be permanently attached, with a transparent, oil resistant protective covering, to the inside surface of the control cabinet door.

8.7.5 Auxiliaries with remote control positions shall be supplied and installed with a "Remote/Local" control switch in its motor starter/controller enclosure. In addition to the remote push button start and stop controls, remote motor running status indicators shall be supplied and installed. When the "Remote/Local" switch is in the "Local" position, it shall not inhibit the remote "Stop" function.

8.7.6 All motors connected to power feeds from static power converters shall be rated for inverter use.

8.8 POWER CONVERSION EQUIPMENT

8.8.1 All transformers shall be dry type, single phase and, with the exception of the shore power isolation transformer, rated at least Class F. Transformer ratings shall be standardized wherever possible.

8.8.2 Where an UPS is required by an individual system it shall be approved for marine use, shall have input and output isolation transformers, and, if hard-wired, an external manual bypass capability.

8.8.3 UPSs shall have an input voltage of 115 volts, 60 Hz. Batteries shall be sealed, suitable for deep discharge cycling and shall have as a minimum the capacity to provide the rated output for no less than 15 minutes.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

8.9 115 V AND 230 V RECEPTACLES

8.9.1 All receptacles shall be "Specification Grade" duplex U-ground and, where used for general-purpose, rated for 15 amp, 115 volt, single phase, 60 Hz. Receptacles shall be installed in each compartment, except hazardous areas in which outlets are prohibited, and there shall be at least one receptacle installed for every eight (8) m^2 of deck area, defined by the compartment boundaries.

8.9.2 Passageways, washrooms, laundry area and other spaces not specifically listed shall have at least one (1) receptacle installed. For every three (3) metres of passageway, or fraction thereof, regardless of the presence of equipment, there shall be at least one (1) receptacle installed.

8.9.3 Cabins shall be supplied and installed with a minimum of three (3) receptacles regardless of the presence of furniture. In addition, the mirror/medicine cabinet in each cabin shall be supplied and installed with a shaver outlet, separate from the cabinet's fluorescent lighting and integral switch.

8.9.4 Sufficient receptacles shall be installed to provide power for all specified equipment in the Command Centre plus an equal number of spare receptacles.

8.9.5 Additional, non-duplex receptacles on dedicated circuits shall be installed in the galley and mess for all countertop equipment and audio visual equipment.

8.9.6 Additional, non-duplex receptacles shall be installed elsewhere for all test equipment, portable tools, communication equipment, computers and other electrical equipment and appliances not specifically listed herein.

8.9.7 Internal work stations shall have at least one (1) non-duplex receptacle installed.

8.9.8 There shall not be more than eight (8) outlets per circuit for general purpose branch circuits.

8.9.9 Single (non-duplex) watertight 115V receptacles shall be installed for each radar antenna, in the steering gear compartment, in the MMR, in the fore peak, in all machinery spaces and other areas and compartments exposed to raw water. Six (6) exterior receptacles, three (3) each side port and starboard located at the forward, the middle and the aft end of the superstructure on the main deck, shall be installed for general utilities purposes. Each exterior receptacle shall be on a separate branch circuit.

8.9.10 As a minimum, four (4) exterior single watertight receptacles shall be installed on the Bridge top, each supplied from a separate branch circuit.

8.9.11 230V / 20 amp receptacles shall be installed to supply portable galley equipment requiring that service.

8.9.12 230 V / 30 amp receptacles shall be installed to supply laundry equipment requiring that service.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

8.9.13 One (1) 230 V / 20 amp and one (1) 230 V / 30 amp three phase watertight receptacles shall be installed on each side of the external working decks for auxiliary machinery and equipment, such as winches, portable pumps or other specialized equipments. At each end of the MMR, there shall be one (1) water tight receptacle of 230 V / 30 amp single phase.

8.10 LIGHTING

8.10.1 Interior lighting fixtures shall be installed and shall be of the fluorescent or compact fluorescent type wherever possible. The number of different fixture types shall be minimized in order to reduce the quantity and type of spare parts and lamps to be carried on board. Fixtures shall be constructed of corrosion resistant materials. Fixtures shall be suitable for direct mounting to bulkheads or decks, without the need for vibration isolation mounts. Fixtures shall use 115 volts, single phase, 60 hertz, and shall have solid state high efficiency ballasts.

8.10.2 Lamps shall be standard North American types, to fit common, commercially available sockets.

8.10.3 Lighting shall be controlled locally by specification grade switches installed at the entrance to each space. Where spaces have two (2) or more entrances, switches shall be located at each entrance. Passageway lighting shall be switched from the distribution panel. Specific task lights shall have integral switches. All lighting switches shall be double-pole to ensure complete isolation of the lamps when switched off.

8.10.4 Where emergency lighting cannot be supplied and installed integral with the normal lighting, separate non-rechargeable, battery-powered fixtures providing a minimum of two (2) hours of lighting shall be installed. These fixtures shall be automatically energized upon power interruption.

8.10.5 Switches to control lighting at hatches and doors shall not restrict neither the size of the hatchway and door opening nor the clear operation of the hatchway and door.

8.10.6 Watertight fixtures installed in outside spaces shall be constructed of corrosion-resistant material and have a corrosion resistant finish. Lamps shall be capable of being replaced without the use of special tools.

8.10.7 Levels of illumination in specific compartments and areas shall be as follows:

a. 55.0 lux for storerooms, fan compartments and Bridge; and

b. 110.0 lux for machinery space(s), emergency switchboard compartment, passageways, and steering gear compartment; and

c. 220.0 lux for toilets, washrooms and showers, cabins, Mess and wet gear locker; and

d. 300.0 lux for galley.

8.10.8 The levels of illumination shall vary within the Command Centre: 110.0 lux for the area in general, 500.0 lux at the program staff's work surface, and 220.0 lux at the Program/Incident

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Commander's workstation. The Command Centre shall have a variable light control for the room and at specific zones so that illumination within the room is capable of being dimmed individually or globally. Primary light controls shall be labelled and located at the Program/Incident Commander's station. A light control at the door is required to facilitate a safe passage to the Program/Incident Commander's station.

8.10.9 Illumination levels in other areas of the MSPV shall meet the Marine Occupational Safety and Health Regulations for vessels that are five hundred (500) tons or greater registered tonnage.

8.10.10 Illumination for the Bridge Control Station (BCS) shall be the minimum level necessary to maintain a visual gradient with the alarm, signal and indicating lights, and to readily recognize all information cues from the BCS. Glare reducing features such as anti-glare coatings and individual dimmable light switches shall be installed on all displays.

8.10.11 All space illumination in the Bridge shall be capable of being dimmed as a group in addition to the standard fluorescent fixtures. The Bridge shall be equipped with red illumination for use at night.

8.10.12 The chart table shall be supplied and installed with supplementary dimmable red and white lighting to produce from zero up to 220.0 lux at the chart table.

8.10.13 Dimming capability for indicator lights in the Bridge shall be supplied and installed, except that no dimming is permissible for warning and alarm indicating lights.

8.10.14 All principal illumination fixtures shall be flush mounted with the deckhead, false deckhead and bulkhead, unless otherwise specified.

8.10.15 Each cabin shall be supplied and installed with a minimum of one fluorescent type overhead fixture for general illumination, controlled by a switch at the entrance. A desk light in way of each desk with an integral switch, a mirror light over each mirror and a berth light at the head of each bunk, each with an integral switch, shall also be supplied and installed.

8.10.16 All passageways shall be equipped with red illumination for use at night in addition to the standard fluorescent fixtures.

8.10.17 Drip proof fluorescent light fixtures shall be installed in all machinery spaces. Machinery space lighting shall not be switched.

8.10.18 Lights illuminating store and locker spaces shall be housed in drip proof guarded fixtures. Switches adjacent to access entry shall control the lighting.

8.10.19 Workbench general lighting shall be fluorescent.

8.10.20 Fixtures shall be placed to illuminate ladders, walkways, obstructions, abrupt changes in deck level and other hazards to personnel safety.

8.10.21 Exterior lighting shall be switch controlled from the Bridge.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

8.10.22 Deck lighting and exterior lights shall be watertight types with guards. Fixtures shall be connected to the ship's service power via through-bulkhead fittings, so that the cabling runs internal to the hull.

8.10.23 Portable fixtures shall be supplied and installed to illuminate the gangway areas, along with dedicated switched receptacles.

8.10.24 Four (4) portable floodlights, watertight, corrosion resistant, and at least 200 Watts (quartz halogen) types shall be supplied and installed for the rescue boat and life raft areas, shore transfer and connection station(s), embarkation and disembarkation station(s), and mooring areas.

8.10.25 Two (2) floodlights of at least 1000 Watts each shall be permanently mounted on brackets facing aft on port and starboard sides to illuminate the aft working deck.

8.10.26 One (1) additional floodlight of at least 500 Watts shall be mounted on a portable arm, with fittings located at various locations around the working deck. The locations of these fittings will enable the floodlight to illuminate the port and starboard sides and the stern. The floodlight on the portable arm shall be supplied by a three (3) m power cord and watertight plug, and shall not interfere with deck equipment operation.

8.10.27 One (1) floodlight of at least 500 Watts shall be supplied and positioned to illuminate the forecastle. The fixture shall be hooded to help prevent light spill over into the Bridge.

8.10.28 Stowage for the portable floodlights and portable arm shall be supplied and installed onboard. Protective covers shall be supplied and installed as per paragraph 5.17.1 above. Watertight receptacles shall be arranged for the floodlight supplies and control shall be from the Bridge.

8.10.29 Two (2) searchlights shall be fitted on the Bridge top, forward near each side. The searchlights shall have a minimum output of ten (10) million candelas each, and shall be complete with anti-icing heaters and remote control of slew, tilt and focus. All searchlight functions shall be controlled electrically from a remote panel mounted on the BCS. The searchlights shall be capable of moving through a minimum of 360.0° horizontal sweep and a minimum of 35.0° vertical sweep both above and below the horizontal plane of the light. The searchlights shall be mounted as high as practical. Search beam blockage from other mounted equipment or superstructure shall be minimized as much as practical. The searchlights shall not weigh more than 30 kg each. At least one (1) searchlight shall be supplied from the emergency bus. Each searchlight shall be installed with vibration isolation mountings.

8.10.30 A central navigation light control panel for all navigation lights shall be fitted at the BCS. The vessel's blue flashing warning light shall also be controlled from the central navigation light control panel.

8.11 24 V DC DISTRIBUTION AND 12 V DC DISTRIBUTION

8.11.1 24V and 12V Direct Current (DC) systems, where required for engine starting, or other systems not listed in this Section, shall be supplied and installed.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

8.11.2 Batteries and charging systems shall be designed and installed for the following purposes:

a. Group 1 Generator set engine starting (if electric start selected); and

b. Group 2 Emergency generator set engine starting (if electric start selected); and

c. Group 3 Battery backup systems, including UPS.

8.11.3 Group 1 and 2 batteries shall be located as close as practicable to the engines concerned. Each set of Group 1 and Group 2 batteries shall be sized to have as a minimum the capacity to meet IEEE Std. 45 requirements for engine starting.

8.11.4 Battery chargers, certified for marine application, shall be of constant voltage type, fully automatic, featuring float or boost charge arrangements and be selected and sized to suit the application. The battery chargers shall be equipped with, as a minimum, "on/off" switch, power "on" indicating light, voltmeter, ammeter, boost operation indicator, manual boost override, protection against overload and overcharging. Printed circuit boards in chargers shall have conformal coating.

8.11.5 Each set of Group 1 and 2 batteries shall have no other connected loads and shall be supplied and installed with a dedicated battery charger.

8.11.6 One (1) portable battery charger shall be supplied for charging spare batteries of all sizes fitted in the MSPV.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

This page left intentionally blank.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

9 NAVIGATIONAL, COMMUNICATION & MACHINERY CONTROL SYSTEMS

9.1 GENERAL

9.1.1 The MSPVs shall be supplied and installed with navigation equipment, communication equipment, collision avoidance signals, and all miscellaneous equipment needed for the safe handling of the MSPVs. Additionally, the MSPVs are to be in compliance with the Navigation Safety Regulations under Arctic Waters Pollution Prevention Act and the Standards for Navigating Appliances and Equipment (1983) – TP 3668.

9.1.2 All equipment shall be capable of withstanding momentary loss of power as described by the OEM for that particular piece of equipment without damage.

9.2 BRIDGE LAYOUT

9.2.1 The Bridge shall incorporate the radar, electronic chart system (ECS), and all other navigation aids necessary to:

a. determine and plot the ship's position, course, track and speed; and

b. analyze the traffic situation; and

c. decide on collision avoidance manoeuvres; and

d. effect internal and external communications related to navigation and manoeuvring, radio communication on the Very High Frequency (VHF); and

e. give sound signals and hear sound signals; and

f. monitor course, speed, track, and depth of water; and

g. record navigational data.

9.2.2 It shall incorporate all gauges, instrumentation, and alarms required to fully monitor the ship's propulsion system and auxiliaries as well as permit the helmsman to control rudder, MSPV speed and propulsion both ahead and astern.

9.2.3 A chart table shall be supplied and installed on the Bridge and should face forward. The chart table shall not face aft.

9.3 SHIP'S INFORMATION SYSTEMS

9.3.1 All internal communications, external communications, navigation equipment and materials shall be supplied and installed.

9.3.2 All cables shall be protected against mechanical damage, water ingress and EMI.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

9.3.3 All coaxial cables for radio transceivers shall be RG-214, unless otherwise specified herein.

9.3.4 Cable runs shall be segregated and grouped in accordance with CCGS 70-000-000-EU-JA-001.

9.4 RADIO FREQUENCY (RF) EXPOSURE SURVEY

9.4.1 A survey to determine radio frequency radiation shall be conducted on all parts of all upper decks.

9.4.2 To ensure that personnel shall not be exposed to harmful radio frequency radiation while conducting training and working on deck, each radar shall be fitted with RF emission keys or fuses that shall be capable of ceasing RF transmission and antenna rotation.

9.5 INTERFACING REQUIREMENTS

9.5.1 All navigational equipment and applicable communication equipment shall be interfaced utilizing the National Marine Electronics Association (NMEA) 0183 Industrial Standard for Communication between Marine Electronics Devices.

9.6 HARDWARE STANDARDS

9.6.1 All radio transmitting equipment installed on the MSPVs shall be type approved by Industry Canada.

9.6.2 All navigating appliances and equipment shall be supplied and installed. They shall comply with the International Electrotechnical Commission (IEC) and International Organization for Standardization (ISO) technical standards, where applicable.

9.6.3 An Administrative Local Area Network (LAN) shall be supplied and installed and shall comply with the Standard Technical Architecture (STA) for Shipboard Computer Systems 46-000-000-ES-TE-001.

9.7 SOFTWARE STANDARDS

9.7.1 All software for the Administrative LAN shall be supplied and installed and shall comply with the STA for Shipboard Computer Systems 46-000-000-ES-TE-001.

9.8 NAVIGATING APPLIANCES AND EQUIPMENT

9.8.1 All the equipment specified and the associated hardware, such as antennae, shall be supplied, installed, integrated and commissioned in accordance with the recommendation and guidance of the respective OEMs. Electrical and electronic equipment shall be arranged and installed so that EMI does not affect the proper function of navigational or other systems and equipment.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

9.9 GYRO COMPASS

9.9.1 One (1) C Plath 2100 fibre optic gyro compass shall be supplied and installed in the EER. Bearing repeaters with pelorus capability shall be supplied and installed on each of Bridge Wings. Bearing repeaters are to be mounted on longitudinal slide rails to enable the user to relocate the repeater fore and aft.

9.9.2 A steering repeater shall also be supplied and installed at the BCS and at the emergency steering location. A numeric repeater shall be installed on the forward Bridge bulkhead at deckhead level. The fibre optic gyro system shall be supplied and installed to provide a digital heading data in NMEA 0183 format (HDT) to the radars, ECS, Autopilot, Automatic Identification System (AIS) and the E-mail-at-sea system.

9.10 NAVIGATIONAL RADARS

9.10.1 Two (2) navigation radar systems shall be supplied and installed complete with collision avoidance display, Automatic Radar Plotting Aid (ARPA) and alarm system. The radar system shall provide ARPA information to the ship's ECS and the Trackplot computer in the Command Centre.

9.10.2 The radars shall be Sperry Marine VisionMaster FT X-Band and S-Band inter-switched radars (bulkhead transceiver). The system shall consist of the following units:

a. VisionMaster FT Radar CAT2 252/6/BT/VM2 complete with buffered video output, Interface unit required for AIS input, Keyboard and Joystick Human Machine Interfaces and performance monitor; and

b. VisionMaster FT Radar CAT2 253/12/BT/VM2 complete with buffered video input, Interface unit required for AIS input, Keyboard and Joystick Human Machine Interfaces; and

c. Interswitch unit.

9.10.3 In addition, both radars shall be supplied and installed complete with bi-directional couplers having a 20dB forward and reverse coupling and a directivity of 40dB. The X-Band radar shall be supplied and installed with a rigid waveguide (RG51). Along with the bi-directional coupler, the waveguide shall be supplied and installed complete with a pressure gauge and pressure windows. The S-Band waveguide shall be LDF5-50A.

9.10.4 A remote radar display shall be supplied and installed in the Command Centre. This remote display shall be capable of being switched to either radar.

9.10.5 The radar antennas shall have a minimum vertical separation of one (1) m. The antennae shall be located so that any radar blind arcs which may occur as a result of masts or funnel casings are not dead ahead or dead astern. All attempts shall be made to minimise blind arcs by rounding the mast surfaces and by not fitting items such as lights, and ladders at the antenna radiation level on the mast. A bilingual cautionary notice shall be placed at each entrance to the radar platforms warning of dangers associated with rotating and radiating antennae.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

9.10.6 Each antenna shall be supplied with a safety switch, located at the entry point or at the base of the respective mast to stop the antenna rotation.

9.10.7 Each radar shall be connected to the differential global positioning system (DGPS) receiver, the (AIS), the ECS Trackplot computer, fibre optic gyro and speed log.

9.11 DIFFERENTIAL GLOBAL POSITIONING SYSTEM

9.11.1 The MSPV shall be fitted with a Saab R4 Differential Global Positioning System (DGPS) Nav Sensor, Saab R4 Control and Display unit and associated J4N junction box. The DGPS system output shall be connected via a two position data selection switch to a data buffer unit. A second input to the two position data selection switch will be from the DGPS to the AIS. The Data Buffer unit will provide NMEA 0183 connectivity to the radars, AIS, Autopilot, echo sounder, ECS, and the Trackplot computer in the Command Centre

9.11.2 A combined Global Positioning System (GPS) beacon and antenna shall be supplied and installed on the mast.

9.12 AUTOMATIC IDENTIFICATION SYSTEM (AIS)

9.12.1 An automatic identification system (AIS) shall be supplied and installed to automatically provide MSPV position and vessel information to systems ashore and to other vessels.

9.12.2 The AIS shall provide AIS information to the ship's ECS and radars.

9.12.3 The AIS system is to include the Saab R4 transponder, Saab R4 DGPS Nav Sensor, Saab R4 Control and Display unit and associated J4 and J4N junction boxes. DGPS output shall be connected to the two position data collection switch noted in the DGPS paragraph 9.11.1.

9.12.4 The AIS Nav Sensor shall connect to both ECSs, Trackplot computer and DGPS for bi-directional waypoint transfer.

9.12.5 The antenna for the AIS transceiver shall be supplied and installed in accordance with the accepted antenna arrangement.

9.13 ELECTRONIC CHART SYSTEM (ECS)

9.13.1 Two (2) computers capable of running GFE software, ICAN ALDEBARAN CCG Version application shall be supplied and installed on the MSPV.

9.13.2 The first system shall be supplied and installed in the Bridge. A 19" viewing area flat panel design chart display shall be located at the BCS with a 19" viewing area flat panel design remote display at the chart table in the Bridge. Each Bridge Wing shall have a remote display that shall be at least a 14" viewing area flat panel design. All monitors shall be complete with dimming capability to one candela per square metre for night operation.

9.13.3 A separate 19" viewing area flat panel display area ECS shall be supplied and installed in the Command Centre.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

9.13.4 Inputs from the speed log, navigational radars, fibre optic gyro, DGPS, echo sounder, AIS and anemometer shall be supplied to the ECS.

9.13.5 The ECSs shall be capable of displaying ARPA targets, AIS targets, depth soundings, wind speed and direction information, and electronic chart data in the selected area.

9.14 AUTOPILOT

9.14.1 An autopilot system shall be provided and installed.

9.14.2 The autopilot shall be interconnected to the fibre optic gyro and DGPS.

9.14.3 The autopilot shall employ adaptive steering technology.

9.15 ECHO SOUNDER AND SONAR

9.15.1 One (1) dual frequency recording type echo sounder with display shall be supplied and installed in the Bridge at the chart table with a remote display at the BCS. The echo sounder shall be capable of providing accurate depth indication in feet, fathoms and metres from zero (0) to a maximum depth of at least 200 m with a high contrast Liquid Crystal Display (LCD) display. The echo sounder system shall have an adjustable shallow depth alert and shall be capable of paper recording, electronic recording and storage of data for the depth(s) and the associated time for 12 hours. In addition, the system supplied by the Contractor shall provide a means to retrieve the recorded information. The echo sounder shall be a Simrad ES60 38/200 KHz.

9.15.2 The recorder shall be console supplied and installed at the chart table with digital indicators supplied and installed at the Bridge Wings.

9.15.3 The Simard ES60 illuminated display shall be supplied and installed in the vicinity of the chart table and shall have the capability of being dimmed. The echo sounder shall interface to the DGPS Receiver and ECS.

9.15.4 The transducer shall be supplied and installed in the hull in a location recommended by the OEM. Upon completion of installation, the hull surface in the vicinity of the transducer shall be smoothed and all holes or gaps filled with a suitable marine compound and smoothed.

9.15.5 Space shall be supplied to install an optional sonar with display in the Bridge. The footprint shall be based on a Wesmar HD800. Space shall also be supplied to install its associated transducer and electrical connections. Its location shall be in accordance with the OEM's installation instructions.

9.16 SPEED AND DISTANCE LOG

9.16.1 A speed and distance log shall be supplied and installed to conform to HSC Code rules. It shall supply the ship's velocities in digital format and direction (fore and aft), with respect to the water, at low ship's speed in relatively shallow water and with high resolution. The speed and distance log shall provide the MSPV speed information to the ship's radars and ECSs.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

9.17 VHF DIRECTION FINDER

9.17.1 One (1) automatic VHF direction finder shall be supplied and installed.

9.17.2 The receiver indicator shall be supplied and installed in the Bridge and the antenna shall be supplied and installed at the top of the main mast.

9.17.3 The VHF direction finder shall be a Cubic OAR4400.

9.18 NAVIGATIONAL AND SIGNALLING EQUIPMENT, NON-ELECTRICAL NAVIGATION AIDS

9.18.1 The Bridge shall be supplied and installed with lockers for miscellaneous navigational aids such as chart folios, publications, documents, signalling lamps, three (3) binoculars, two (2) night vision goggles, and other required items.

9.18.2 A control panel integrated with only the ship's whistle system shall be supplied and installed to automatically sound the ship's whistle in fog conditions.

9.18.3 The ship's fitted loudhailer system shall be interfaced to the CCAMS and shall provide an audible indication for set abnormal conditions onboard when the MSPV is unoccupied. An external yellow flashing 200 Watt light interfaced to the CCAMS shall also be supplied and installed to similarly indicate abnormal conditions.

9.18.4 One (1) 300 mm high by 320 mm diameter brass ship's bell complete with mounting brackets, clapper, striking lanyard shall be supplied and installed at a location to be designated by the TA. The MSPV's name shall be engraved on the bell. The bell engraving shall be as follows:

a. Canadian Coast Guard – 29 mm;

b. Ship name – 38 mm; and

c. Date of completion in full (day/month/year) – 12 mm.

9.18.5 The proposed font shall be approved by the TA prior to engraving the bell.

9.18.6 Hoisting arrangements shall be supplied and installed for displaying the day shapes and international code flags.

9.19 METEOROLOGICAL SYSTEM

9.19.1 The MSPV shall be supplied and installed with a meteorological system as follows:

a. A wind speed and direction indicator with an indicating instrumentation system, installed in the Bridge; and

b. Exterior air temperature unit capable of displaying in the range of –50.0°C to 50.0°C with an accuracy of +/-1.0 °C, installed in the Bridge; and

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

c. A recording barometer, installed in the Bridge; and

d. A non-recording barometer, installed in the Captain's Cabin; and

e. An atmospheric Environmental Services of Canada compliant automatic voluntary observation ship's (AVOS) system, supplied as government furnished equipment (GFE) shall be installed. Location to be designated by the TA.

9.19.2 The ship's anemometer shall provide the wind speed and direction data to the ship's ECSs.

9.20 EXTERNAL DATA TRANSMISSION

9.20.1 All components installed in areas exposed to the weather shall be fully protected by waterproof enclosures or shall be watertight to NEMA 4X.

9.21 SATELLITE TERMINAL

9.21.1 An INMARSAT FleetBroadband 250 terminal shall be supplied and installed in the vicinity of the chart table.

9.21.2 Connection shall be made to the Telephone System to allow for voice communications.

9.21.3 Connection shall be made to the Telephone System to allow for facsimile communications.

9.22 SECURE COMMUNICATIONS SATELLITE TERMINAL

9.22.1 The Secure Communications Satellite Terminal (SCST) system shall consist of a Sailor SC4000 Iridium satellite phone with encryption devices. One (1) Iridium Satellite phone shall be supplied and installed in the Command Centre. The SCST shall be compatible with the Secure Communications Interoperability Protocol (SCIP). Space for one (1) SCIP unit, a General Dynamics BDI Sectera encryption device, shall be allocated in the Command Centre. The SCIP unit will be supplied by the Canadian Security Establishment after delivery of each MSPV.

9.22.2 One (1) remote handset for the Iridium satellite phone shall be supplied and installed in the Bridge at the BCS. The unit shall be interfaced to the telephone system to allow authorized telephones access to this system. One (1) antenna shall be supplied and installed in accordance with the accepted antenna arrangement.

9.22.3 For clarity and to summarize, the SCST system shall include one of each of the following specific components:

a. transceiver; and

b. multifunctional handset; and

c. hands free microphone; and

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

d. antenna electronics unit; and

e. security device (GFE); and

f. remote handset.

9.23 EMAIL-AT-SEA

9.23.1 A Vessel Satellite Communication System (VSCS) for E-mail-at-sea system, supplied as GFE, shall be installed as follows:

a. One (1) SeaTel antenna model 4006 for the VSCS system shall be mounted in accordance with the accepted antenna arrangement; and

b. Equipment rack with shelve(s) shall be installed in the Electronic Equipment Room (EER) to house the VSCS equipment. The equipment shall be installed in a standard 19" 40 RU rack which provides a minimum of 77.5 cm useable depth. The rack shall be of welded steel construction as per "Specification for the Installation of Shipboard Electronic Equipment (70-000-000-EU-JA-001 July 2003; and

c. All power, interconnect and antenna cables are not GFE and shall be supplied, installed, terminated and set-to-work.

9.24 HF COMMUNICATIONS

9.24.1 One (1) Medium Frequency/High Frequency (MF/HF) radio telephone shall be supplied and installed in the Bridge. The antenna shall be installed in accordance with the accepted antenna arrangement. Units shall be Motorola Model Micom 2 complete with F2260 Antenna Tuner.

9.24.2 The radio-telephone shall have the following features:

a. R.F. power output of 125 Watts P.E.P.; and

b. fully synthesized and capable of 120 channel selection over 1.6 MHz to 30 MHz range; and

c. fully automatic tuning, within 15 seconds of channel selection; and

d. channels shall be field programmable; and

e. incorporates a two-tone distress generator.

9.24.3 The radio-telephone shall be supplied complete with:

a. electronic noise blanker; and

b. interconnecting cabling; and

c. power supply.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

9.25 VHF COMMUNICATIONS

9.25.1 Marine Transceivers: These units are in addition to the Global Maritime Distress and Safety System (GMDSS) Digital Selective Calling (DSC) unit required as part of the GMDSS station.

9.25.2 Two (2) VHF/FM Marine radio transceivers shall be supplied and installed in the EER, each having associated remote units supplied and installed in the Bridge, and the Command Centre. One (1) VHF/FM Marine transceiver and associated antenna shall be supplied and installed, at a location aft on the MSPV. The antennae shall be the Coast Guard version of Sinclair Model 225M, centre cut to 156.8 MHz.

9.25.3 All transceivers shall have as a minimum the following features:

a. fully synthesized operation, covering all US and International private and weather channels which are used in the VHF band; and

b. programmed for all fifty-five (55) international maritime VHF channels with an additional capability to program a further twenty (20) private channels; and

c. sea watch operation with at least two (2) channels and including priority operation on Ch 16; and

d. One (1) button selection for Ch 16; and

e. One (1) Watt and twenty-five (25) Watt power output; and

f. Full function remote operation, with lock-out of remote at master control; and

g. Capable of transmitting in the frequency range of 155.4 MHz to 158 MHz, at channel separations of 25 kHz; and

h. Capable of receiving in the same frequency range and 160.0 MHz - 162.6 MHz; and

i. A sensitivity of 0.3 micro-volts for 12 db sinad, single channel operation.

9.26 AIR/GROUND TRANSCEIVER

9.26.1 One (1) VHF/AM radiotelephone shall be supplied and installed in the Bridge. The antenna shall be a Sinclair SRL-238M.

9.26.2 Features shall include:

a. 760 channel selection at 25 kHz spacing between 118 MHz and 136 MHz; and

b. 16 Watts nominal RF power output; and

c. side tone capability, adjustable up to 100 mW into 500 ohms; and

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

d. single channel store and recall memory; and

e. speaker and headphone outputs.

9.27 WIDEBAND ENCRYPTION TRANSCEIVER

9.27.1 One (1) Mobile VHF-FM Wideband Radiotelephone complete with dual remote control heads, dual speakers, antenna and power supply shall be supplied and installed. The transceiver shall operate in a frequency range from 136 MHz to 174 MHz at a RF power level of 10 to 50 watts. Channel spacing shall be variable/programmable and Primary Operation and System Type shall be programmable. Feature Level shall be the Standard Package. The Transceiver unit shall be supplied and installed in the EER.

9.27.2 One (1) remote unit complete with limited keypad and display shall be supplied and installed in the Bridge and a second shall be supplied and installed in the Command Centre. Both units shall be supplied with encryption modules and all software required for programming of the transceiver and the encryption modules.

9.27.3 The antenna shall be Sinclair SRL-233 centre cut to 156.8 MHz. The antenna shall be supplied and installed in accordance with the accepted antenna arrangement. Each remote unit shall be equipped with an external speaker.

9.27.4 The Radiotelephone shall be a Motorola Astro XTL 5000 Digital Mobile Radio.

9.28 PORTABLES

9.28.1 Five (5) VHF/FM portable radio telephones, each fitted with a battery charger shall be supplied and installed in the Bridge. Three (3) of these shall be GMDSS TCMS approved units, Skanti VHF 9110, and two (2) shall be Icom M72 with Built-in UT112 voice scrambler. Units shall be supplied with carrying case and strap.

9.28.2 Two (2) Ultra High Frequency (UHF) FM portable radio telephones, each fitted with a battery charger shall be supplied and installed in the Bridge. Units shall be intrinsically safe Motorola MT1500 units capable of operating on 467 MHz. Units shall be supplied with intrinsically safe remote microphones, carrying case and strap.

9.29 GLOBAL MARITIME DISTRESS AND SAFETY SYSTEM STATION

9.29.1 One (1) Global Maritime Distress and Safety System (GMDSS) station meeting Canadian domestic carriage requirements shall be supplied and installed in the Bridge at a location agreed to by Canada. All operator interface components of the GMDSS station, with the exception of VHF Digital Selective Calling (DSC) radios, GMDSS portables, Emergency Position Indicating Radio Beacon (EPIRB), and Search and Rescue Radar Transponders (SART), shall be physically located in a deck standing console. The console shall meet the requirements of the Canadian Radio Inspection Certificate for A3 configuration. The station shall be supplied and installed complete with cables, batteries, connectors, antenna, display terminals, printers and all other items required

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

for equipment set-to-work in conformance with the above requirements. The equipment shall be type-approved to IMO and IEC GMDSS performance standards.

9.29.2 Reserve battery or batteries shall be supplied and installed and all shall have as a minimum the capacity to power necessary equipment to satisfy the regulatory requirements. A battery-charging unit shall be supplied and installed.

9.29.3 The INMARSAT Standard C terminal, with Enhanced Group Call shall comply with the latest of INMARSAT performance standards. It shall also comply with the latest IEC regulations. The Standard C terminal shall be comprised of an integrated transceiver with monitor display and disc drive. A keyboard, printer, and remote distress control unit are also required. The Standard C terminal shall have a built-in GPS receiver that will allow automatic updating of the ship position every five (5) minutes in the event of a distress. The GPS antenna supplied shall be integral to the Standard C antenna radome.

9.29.4 The Medium Frequency / High Frequency Digital Selective Calling (MF/HF DSC) shall be a solid-state MF/HF DSC transceiver which shall have a power output of not less than 200 Watts PEP. The transceiver shall have a tuning range covering from 1.7 MHz to 28 MHz. The transceiver shall be tuneable on all International Telecommunication Union (ITU) marine channels, ITU Radio Regulations Appendix 18 refers, plus shall be capable of providing one hundred (100) programmable channels. The transceiver shall consist of three separate units – controller/remote, transceiver and automatic tuner unit (ATU). These three (3) units shall be capable of functioning with connecting cables. The controller shall include a NMEA 0183 interface for navigational devices such as a GPS receiver.

9.29.5 The Narrow Band Direct Printing Equipment, and the Search and Rescue Radar Transponder (SART) shall be compliant with the latest IEC requirements.

9.30 UHF COMMUNICATIONS

9.30.1 Space for one (1) multi-band transceiver (115 MHz -138 MHz, 136 MHz-174 MHz and 225 MHz -400 MHz bands) with scanning and fixed frequency operation in both AM and FM capability to communicate with Department of National Defence (DND) UHF/VHF AM/FM multi-band transceivers and ancillaries shall be allocated. This space shall be 5RU and allocated in the communications rack in the Command Centre to temporarily mount this transceiver.

9.30.2 A means to securely fasten this equipment shall be supplied. Antenna(e) to support this transceiver shall be supplied and permanently installed on the Bridge top or mast.

9.31 LOUDHAILERS

9.31.1 Two (2) weatherproof horn type loudhailers shall be supplied and installed on the searchlights.

9.31.2 The loudhailers shall be controlled from the BCS.

9.31.3 The loudhailers are part of the internal communication system and shall be integrated with the Talkback and Public Address (PA) systems.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

9.32 RACK(S) OR SHELVE(S)

9.32.1 19" Communications Rack(s) of welded steel construction as per 70-000-000-EU-JA-001, with a minimum of 65.4 cm useable depth and shelves shall be supplied and installed in the Command Centre to house radio transceivers that will be required by other Government Agencies during joint operations. If one (1) rack cannot accommodate all of the equipments listed below, a second rack with shelves shall be supplied and installed.

9.32.2 The rack(s) and shelves shall be designed, built and installed to allow quick and easy installation of the required radio transceivers. All power, interconnect and antenna cables shall allow for quick connect and disconnect.

9.32.3 A secure means of temporarily mounting the equipment shall be supplied and installed.

9.32.4 Antennae supporting the equipment noted below in 9.31.5 shall be supplied and permanently installed in accordance with the accepted antenna arrangement.

9.32.5 The rack(s) with shelves and 1RU vent panels separating each equipment shall have as a minimum the space to allow for the following equipment to be installed:

a. Motorola PDR 3500; and

b. VHF/UHF Transceiver; and

c. Motorola UHF Quantar Station/Repeater with duplexer; and

d. Motorola VHF Quantar Station/Repeater with duplexer; and

e. Ontario Provincial Police Transceiver – approximately 21 cm L x 8 cm D x 8 cm H; and

f. Quebec Provincial Police Transceiver – approximately 21 cm L x 8 cm D x 8 cm H; and

g. Kenwood TK980 Trunk Radio Transceiver; and

h. Motorola Astro XTL 5000.

9.33 CELLULAR PHONE

9.33.1 One (1) digital cellular phone capable of transmitting at a minimum power of three (3) Watts shall be supplied and installed in the Command Centre.

9.33.2 The antenna shall be supplied and installed in accordance with the accepted antenna arrangement.

9.33.3 The cellular phone shall be connected to the Integrated Internal Communications System (IICS) to allow authorized telephone access to this system.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

9.34 NAVTEX RECEIVER

9.34.1 One (1) Navtex receiver system shall be supplied and installed in the Command Centre and shall be connected to its antenna.

9.34.2 The antenna shall be located in accordance with the accepted antenna arrangement.

9.35 EMERGENCY POSITION INDICATING RADIO BEACON (EPIRB)

9.35.1 One (1) Class I TCMS approved EPIRB shall be supplied and installed on the Bridge top, clear of masts and antennae and mounted in a float free bracket.

9.36 RCMP TRANSCEIVERS

9.36.1 Space for one (1) Royal Canadian Mounted Police (RCMP) transceiver, a Motorola PDR 3500, TransPortable Digital Repeater (PDR)/TransPortable Base Station, one (1) Motorola Quantar (UHF) Station/Repeater and, associated duplexers shall be allocated in the communications rack(s) in the Command Centre to temporarily mount these units.

9.36.2 A means to securely fasten this equipment when installed shall be supplied.

9.36.3 The antennae to support these transceivers shall be supplied and permanently mounted in accordance with the accepted antenna arrangement.

9.36.4 Two (2) Sinclair SC320 collinear omni antennae shall be fitted in accordance with the accepted antenna arrangement and connected to the above transceivers utilizing LMR 600 FR coaxial cables.

9.36.5 The transmit frequency for the Motorola PDR unit shall be 426 MHz and the receive frequency shall be 421 MHz. The frequencies for the Motorola Quantar will be provided later.

9.37 OTHER GOVERNMENT AGENCIES

9.37.1 Two (2) spare runs of RG-214 coaxial cable and two (2) spare runs of LMR 600 FR coaxial cable shall be run from the communication rack(s) in the Command Centre to the Bridge Top to facilitate the installation of associated antennae for these transceivers in accordance with the accepted antenna arrangement.

9.38 CLOSED CIRCUIT TELEVISION SYSTEM (CCTV)

9.38.1 A CCTV system with a digital recording capability shall be supplied and installed on the MSPV and distributed over the administrative LAN.

9.38.2 The master monitor shall be supplied and installed in the Bridge.

9.38.3 Fixed cameras shall be supplied and installed throughout the MSPV in such a manner so as to allow complete monitoring of the entire upper deck area, all working deck areas, the gangway, and all machinery spaces.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

9.39 INTERIOR DATA TRANSMISSION

9.39.1 An internal data transmission system shall be supplied and installed. It shall be comprised of the following networks:

a. NMEA 0183 data network for Navigational and Communication Equipments; and

b. Ethernet 1 Gigabit per second (Gbps) for the administrative and operational LANs; and

c. International Processing Standards for Computers Communications Link for the Machinery Control Link.

9.39.2 The routing of cables and the grounding and bonding of electronic equipment shall meet the requirements of CCGS 70-000-000-EU-JA-001, General Specification for the Shipboard Installation of Electronic Equipment.

9.40 NAVIGATION AND COMMUNICATION SYSTEMS

9.40.1 Navigation and selected communication equipment shall be interfaced utilizing the NMEA 0183 data bus. This is also referred to as the IEC61162 standard.

9.41 LOCAL AREA NETWORKS (LAN)

9.41.1 Two (2) separate fibre-optic Ethernet-based Computer LANs shall be supplied as per STA 46-000-000-ES-TE-001. One (1) network will be used for operational purposes and the other will be used for administrative purposes. Each drop shall be fed by three (3) fibre optic pairs in a single tube. Each end of the fibres should be terminated by ST type connectors. The third fibre optic pair shall be connected to a fibre optic to Ethernet (RJ-45) converter. Converters shall be supplied and installed in the bulkhead and shall be powered. A maintenance access shall be supplied.

9.41.2 Computer connection capability shall be supplied to the administrative LAN, to allow information access and a means to communicate to all areas of the MSPV specified herein.

9.41.3 Operational LAN drops shall be supplied and installed in the following areas:

a. Three (3) in the Command Centre; and

b. One (1) in the Program Officer's/Incident Commander's cabin.

9.41.4 Administrative LAN drops shall be supplied and installed in the following areas:

a. Four (4) in the Command Centre (for a total of 7 LAN drops: 3 operational, 4 administrative); and

b. Three (3) on the Bridge; and

c. One (1) in the MCR; and

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

d. One (1) per single cabin; and

e. Two (2) per double cabin; and

f. One (1) in the mess.

9.41.5 A 2.4 GHz 9db Omni antenna shall be supplied and installed. The antenna shall be routed to the LAN equipment rack in the EER by LMR600FR cable. An additional 2 m of cable is to be left coiled in base of rack to allow for future connectivity anywhere in the rack.

9.41.6 19" 40 RU rack of welded steel construction as per 70-000-000-EU-JA-001, with a minimum of 77.5 cm useable depth shall be provided in the EER to house the LAN equipment. Fibre optic cabling shall be terminated in patch panel(s) at the top section of this rack. Remaining vacant space shall be reserved for LAN hardware.

9.41.7 The MSPV shall be fitted-for-but-not-with computer workstations in the following locations:

a. The Bridge; and

b. MCR; and

c. Commanding Officer's Cabin; and

d. Chief Engineer's Cabin; and

e. The Mess.

9.42 TELEPHONE AND INTERCOM SYSTEMS

9.42.1 One (1) IICS shall be supplied and installed. It shall consist of:

a. telephone system with telephones in all cabins, workspaces, mess and workshops; and

b. talk-back system; and

c. PA system; and

d. shoreline connections; and

e. ship's recreational equipment; and

f. loudhailers.

9.42.2 The IICS shall be a Hose McCann (United Marine) Integrated Communication Platform product. System design shall dictate if more than one node (Equipment Cabinet) is required for all endpoint connectivity. One node shall be fitted in the EER and include the UPS, Power Supplies, EPIC, PBX, Main and Standby PA controllers. Cabinet fittings including shock mounts, thermostatically controlled cooling fan to provide positive air pressure, General Alarm override

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

relay and, locking cabinet door shall be supplied and installed. Field wiring termination points shall be supplied directly in the rear of the cabinet, eliminating the need for additional cross-connect or junction panel hardware. Also incorporated within this cabinet shall be the control circuitry for the automatic fog signalling electric whistle system. All Fog Tone generators shall be monitored for failure.

9.42.3 All IICS speaker runs shall be monitored and controlled in such a way that if an open circuit, short circuit or a ground were to occur on either side of the speaker run, then a trouble indication appears on the Control Head, and the speaker run is automatically disconnected.

9.42.4 Functional integration in the Bridge and MCR shall be through the use a Control Head device incorporating access to all PA, Talkback/intercom, loudhailer, system alarm and key telephone system functions. The Control Head device is a single, flush-mount unit, providing distributed single-keystroke access to key IC functions at strategic locations throughout the Bridge and MCR consoles. By means of connections to the IICS, direct access to resources such as cellular and satellite phones shall be supplied through use of pre-programmed codes.

9.42.5 The PBX shall be able to handle voice and data transmissions simultaneously in all configuration of trunks, telephone and data devices. For this application, the exchange shall have a minimum of thirty (30) lines and twelve (12) analog trunks. This PBX shall be fully compatible with shore Central Office equipment.

9.42.6 The Talkback portion of the IICS shall use a telephone circuit for the call-back portion of all Talkback stations allowing Dual Telephone access to the PBX or Talkback function and giving private telephone communication along with the Talkback speaker.

9.42.7 The IICS shall be interfaced to the satellite transceivers and cell phones.

9.42.8 Four (4) analog trunk lines with lightning protection shall be supplied from the ship's IICS to shore.

9.43 AUTOMATIC TELEPHONES

9.43.1 Telephone stations shall be supplied and installed in all work areas and cabins. Each telephone shall be able to dial all other telephones onboard and access the shore trunks and communication systems if so programmed. Push-button dial telephone stations shall be equipped with special marine handset retainers, suitable for bulkhead or desk mount, and be either of regular inside, drip-proof or waterproof type depending on location. In machinery spaces auxiliary visual signalling strobe blue lens lights shall be supplied and installed to indicate an incoming call.

9.43.2 The Captain's Cabin and Bridge telephones shall be supplied with override and all-call paging facilities.

9.44 TALKBACK COMPONENT

9.44.1 The Bridge Talkback system shall be supplied and installed to provide point-to-point voice communication between the BCS and the following outlying stations:

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

a. Captain's Cabin; and

b. Lifeboat Station; and

c. RHIB Stations; and

d. Aft Line Handling Position; and

e. Fwd Line Handling Position; and

f. Fuelling Station(s); and

g. Fuel Transfer Pumps;

h. MMR; and

i. If fitted, AMR; and

j. MCR; and

k. Loudhailers; and

l. Steering Gear Compartment.

9.44.2 The MCR Talkback system shall be supplied and installed to provide point-to-point voice communications between the MCR and the following outlying stations:

a. Bridge; and

b. Fuelling Station(s); and

c. Fuel Transfer Pumps; and

d. Steering Gear Compartment; and

e. MMR; and

f. If fitted, AMR; and

g. Sewage Treatment Room; and

h. Emergency Diesel Generator Compartment.

9.44.3 Communications between the Control Head and the outlying stations shall be by the use of the Control Head handset and dedicated station selection push-buttons. Reply from the outlying stations shall be hands free via the Talk-back loudspeaker, environmental and noise conditions permitting and all fixed and portable telephone headset and handset stations.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

9.44.4 All Talkback locations shall be equipped with individual call-in push-button to signal the group Control Heads. The talkback loudspeaker units shall also be connected to the PA system.

9.45 INTERCOM COMPONENT

9.45.1 An intercom system shall be supplied and installed to provide point-to-point voice communications between the Command Centre and the following stations:

a. Bridge; and

b. Captain's Cabin; and

c. Program Officer/Incident Commander's Cabin; and

d. Mess; and

e. Aft working deck.

9.46 PUBLIC ADDRESS COMPONENT

9.46.1 A PA component shall be supplied and installed to provide routine or emergency broadcast PA facilities to select or all areas of the ship via strategically located loudspeaker units throughout the MSPV. The PA system master control shall be located in the Bridge in a dedicated panel. The Bridge shall have priority over the communication system. Activation of this function shall override the general alarm signal.

9.46.2 Initiation of a PA message shall be from the Control Head station by use of the handset and dedicated selection push-buttons or by specifically programmed telephone stations (all-call only). The PA system shall be consolidated into selectable loudspeaker groups as follows:

a. Group 1 "work stations group"; and

b. Group 2 "common areas group"; and

c. Group 3 "cabin group"; and

d. Group 4 "machinery spaces group"; and

e. Group 5 "exterior deck group"; and

f. All-call (Groups 1, 2, 3, 4 and 5).

9.46.3 PA loudspeaker units shall also have dual functions: operating as public address/loudhail and Talk-back loudspeakers. However, there shall not be any switching devices located in the loudhailers and loudspeaker units to accomplish the additional functions described.

9.46.4 Loudhailers shall be supplied and installed and interconnected as detailed in Section 9.31 of the TSOR.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

9.47 SOUND POWERED TELEPHONES

9.47.1 A sound powered telephone system shall be supplied and installed as a backup for emergency communications between operational stations as follows:

a. Bridge; and

b. MMR; and

c. If fitted, AMR; and

d. Steering Gear Compartment; and

e. MCR; and

f. Aft working deck; and

g. Fuelling station(s).

9.48 SHIP'S ENTERTAINMENT SYSTEMS EQUIPMENT

9.48.1 The ships' entertainment systems equipment shall be fed from the communal entertainment antenna/distribution system.

9.49 TELEVISION AND BROADCAST SYSTEMS

9.49.1 A communal entertainment antenna/distribution system, including all cabling and fittings, shall be supplied and installed. An input for an external cable television shore connection shall be supplied. The shore connection shall be located adjacent to the shore power and shore telephone connections.

9.49.2 The system shall distribute high definition TV and AM/FM radio broadcasts.

9.49.3 The system shall utilize low-loss coaxial distribution cable and separate outlets in each space, where installed.

9.49.4 The TV and AM/FM distribution system shall be designed in such a manner as to provide a nominal level of 0 dbmv +/- 2 db on CATV channel 13 at each cabin outlet. Independent automatic gain control shall be supplied for each channel of the system.

9.49.5 Each antenna outlet shall be connected directly to a trunk-line directional tap-off. Isolation between outlets shall be not less than 25 db on VHF and 18 db on UHF. Trunk line directional tap-offs shall be easily accessible and preferably installed in Store Rooms or Locker Rooms. Where tap-offs are mounted behind bulkhead or deckhead linings, access shall be supplied by a dedicated removable access panel, labelled with appropriate identification.

9.49.6 An antenna system shall be supplied and installed and be comprised of a single omni-directional wide band antenna. Antenna shall be equipped with a preamplifier and shall be

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

connected using low-loss coaxial cable. An antenna control position shall be supplied and installed in the EER. Antenna amplifier shall be supplied and installed near this control station.

9.49.7 The signal distribution system shall distribute TV and AM/FM radio signals to bulkhead-mounted outlets in:

a. the Bridge; and

b. all cabins; and

c. the Command Centre; and

d. the Mess.

9.50 ELECTRONIC EQUIPMENT ROOM

9.50.1 A dedicated EER shall be designed, built and installed in the MSPV, preferably on the main deck. This room shall contain the following equipment:

a. telephone/Talkback equipment; and

b. television and AM/FM radio distribution system, antenna control position and associated amplifiers; and

c. LAN equipment rack including fibre-optic cable termination patch panel(s); and

d. fitted-for-but-not-with two (2) Computer servers; and

e. communications equipment (e.g. FM wideband radio-telephone) with remotes in the Bridge and Command Centre; and

f. fibre optic gyro compass; and

g. E-mail-at-sea equipment rack.

9.50.2 Space shall be allocated in the EER for the installation of one (1) Motorola Quantar VHF repeater and duplexer, and the installation of a second transceiver of similar size. Spare coaxial cables shall be supplied and run from this location to locations in accordance with the accepted antenna arrangement.

9.50.3 Depending on the location of the EER, it may also house the radar transceiver units, which could be bulkhead mounted. A sufficient number of approximately 48.3 cm equipment racks, with adequate space in front of them, shall be supplied and installed so that the equipment can be installed or removed. There shall be approximately 45 cm clear space behind the racks. The racks shall be supplied and installed with removable doors at both the front and the back. The preferred location is near the Bridge and Command Centre.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

9.51 CENTRALIZED CONTROL, ALARM AND MONITORING SYSTEM (CCAMS)

9.51.1 The MSPV CCAMS, employing commercial-off-the-shelf (COTS) hardware and software, shall be supplied and installed.

9.51.2 The CCAMS shall have the main MCS located in the MCR. The MCS shall have remote and automatic machinery control to meet Class UMS requirements and other requirements as stated elsewhere in this document. The CCAMS shall provide an automatic data logging function. CCAMS shall log all alarms and shall have the capability to be configured to log user defined events. A log viewer shall be supplied to review the captured data complete with applicable units of measurement. A dedicated colour printer shall be supplied and installed at the MCS to print logs, active alarm lists and machinery control mimic pages.

9.51.3 The CCAMS shall have a BCS located on the Bridge. The BCS shall have two functions. First, the BCS shall have remote and automatic machinery control to meet Class UMS requirements and other requirements as stated elsewhere in this document. Second, the BCS shall be the human machine interface to provide operator control of propulsion and steering at the BCS over the complete range of vessel operation.

9.51.4 The CCAMS shall have permanent Bridge wing consoles. The wing consoles shall be capable of controlling steering and propulsion. The wing consoles shall be watertight to NEMA 4X, if exposed to environmental elements.

9.51.5 There shall be a CCAMS remote display unit in the Chief Engineer's cabin and in the 2nd engineer's cabin capable of displaying logs, active alarm lists and machinery control mimic pages. The remote display unit in both cabins shall also provide audible and visual alerts for all CCAMS alarms. These shall be able to be acknowledged without removing the alarm condition from the remote display units, the MCS and the BCS.

9.51.6 A ship alert system as per Marine Transportation Security Regulations shall be supplied and installed onboard.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

This page left intentionally blank.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

10 ACCOMMODATION OUTFITTING

10.1 PLUMBING FIXTURES AND ACCESSORIES

10.1.1 All trim pieces for fixtures and all accessories shall be chrome plated cast, forged brass or stainless steel and shall be of matching design for uniformity.

10.1.2 Grab rods shall be supplied and installed at all showers and toilets.

10.1.3 Isolation valves shall be supplied and installed as described at paragraph 7.12.8.

WASHBASINS

10.1.4 Washbasins, showers and service sinks shall be supplied and installed with hot and cold potable water.

10.1.5 Washbasins shall be stainless steel and shall be supplied and installed with self-closing and washerless faucets.

10.1.6 Washbasins, unless otherwise specified, shall be supplied and installed with the following accessories:

a. toiletries cabinet; and

b. soap dish; and

c. soap dispenser; and

d. towel hook/bar/ring.

SHOWERS

10.1.7 The showers shall be supplied and installed with:

a. a low-flow shower head (max 9.0 l/min); and

b. a non-scald mixing valve; and

c. a push button or level-operated control valve; and

d. the following shower accessories: soap dish, shower curtain and grab rail.

DEEP SERVICE SINKS

10.1.8 Each sink or set of double sinks shall be stainless steel and shall be supplied and installed with self-closing and washerless faucets and a soap dish.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

10.1.9 A service sink shall be supplied and installed in cleaning gear lockers if such facilities are not readily available in adjacent sanitary spaces.

TOILETS

10.1.10 Vitreous china toilets (vacuum type) shall be supplied and installed.

10.1.11 A toilet paper holder and grab rail shall be supplied and installed in each toilet enclosure.

10.1.12 A toilet seat, open front type, shall be supplied and installed for each toilet.

10.2 LOCKS, KEYS, KEYBOARDS AND KEY CABINETS

10.2.1 Locks shall be supplied and installed for all doors, hatches, manholes and scuttles. Cabin doors shall be able to be opened from the inside without a key. Identical keys shall be used for all furniture in cabins, different keys shall be used for furniture assigned to each person and four (4) key sets plus one (1) blank shall be furnished. Locks for desks, key cabinets and bookcases in cabins shall be the same as locks for the furniture in the corresponding cabins.

10.2.2 A lockable Key Cabinet shall be supplied and permanently mounted on the Bridge and shall contain one copy of all keys, complete with labels, supplied with the MSPV.

10.2.3 All locks on the MSPV, including locks for access doors, storerooms and lockers, shall be supplied and installed. They are to be keyed alike and shall be capable of being opened by a master key as well as their specific key. The only exceptions to this are the keys and locks for the firearms lockers which shall each be unique.

10.2.4 A lockable Duplicate Key Cabinet shall be supplied and permanently mounted in the Captain's Cabin. It shall contain three (3) labelled copies plus one (1) blank of all keys supplied with the MSPV.

10.3 HABITABILITY

FURNISHINGS

10.3.1 Bulkhead linings and false deckheads shall be supplied and installed in all cabins, Command Centre, mess, accommodation passageways, and Bridge. Bulkhead linings and false deckheads shall be supplied and installed in the galley and sanitary spaces. The outer face of joiner bulkhead panels fitted in the galley shall be stainless steel satin finish. Where necessary for frequent access, inspection, or troubleshooting, deckheads and linings shall be supplied and installed with portable or hinged access panels with easily removable fastenings.

10.3.2 All furniture supplied shall be of commercial design and modular construction, suited for the marine environment shipboard use. All furniture shall be free of sharp edges and burrs. Large articles of furniture shall be mounted on sub-bases and secured at the top and sides. Furniture shall not be rigidly attached to non-structural or joiner bulkheads. Maximum use of durable, low maintenance, lightweight materials and finishes for ease of cleaning shall be incorporated into all accommodation furnishings.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

10.3.3 All berths, drawer units, lockers, sideboards and dining table supports shall be constructed from TCMS approved fire retardant materials with standard marine fit and finish. Accommodation upholstery shall have a woven fabric and shall be fire retardant, washable and fastened to the frame with non-corrosive attachments. Vinyl upholstery shall not be used.

BERTHS

10.3.4 Berths shall be single- or double-tier and shall be installed in the fore and aft plane with the head position forward. Each berth shall accommodate a mattress having dimensions of at least 1980 mm long, 800 mm wide and 150 mm thick. The underside of the bottom tier pan shall be a minimum of 300 mm above the deck. The vertical clearance above the top of each mattress shall not be less than 910 mm.

10.3.5 Each berth shall be supplied and installed with:

a. one (1) reading light; and

b. one (1) stowage space for an Emergency Escape Breathing Device (EEBD) (approx 130 mm x 260 mm x 270 mm); and

c. one (1) a stowage space for reading material (approx 300 mm L x 75 mm D x 300 mm H); and

d. one (1) 150 mm thick spring filled mattress with latex coated spring coils, boxed border, cotton tufting, corded handles and vents and zipped cotton duck covering.

10.3.6 Double-tier berths shall be fitted with separate opaque privacy curtains with tie-backs.

KIT LOCKERS

10.3.7 One (1) kit locker per occupant shall be supplied and installed within each cabin as a minimum. The kit lockers shall be, approximately 500 mm L x 530 mm D x 1830 mm H. The lockers shall provide the following types of stowage:

a. minimum of three (3) drawers; and

b. minimum of five (5) shelves; and

c. one (1) cap stowage (for one RCMP or C&P Officer's Forage Cap); and

d. one (1) boot and shoe stowage; and

e. one (1) hanging bar for uniforms and civilian clothes; and

f. one (1) outside towel rail; and

g. two (2) clothes hooks; and

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

h. Drawers and lockers shall be supplied and installed with cylinder locks keyed alike. Four (4) sets of keys per locker shall be supplied. Lockers shall be designed, built and installed so that they permit free air circulation within the locker and free unobstructed access within the compartments that they are situated in. Drawers and lockers shall not freely open due to the MSPV's motion.

DESKS, WRITING TABLES

10.3.8 Desks of a single pedestal type and appropriately surfaced to reduce husbandry shall be supplied and installed.

CHAIRS

10.3.9 Cabin chairs of a lightweight design with an upholstered seat on a light metal frame shall be supplied and installed.

TOILETRY CABINETS

10.3.10 Cabinets of metal construction and equipped with stainless steel shelves with edge rails and a mirror on doors shall be supplied and installed above each washbasin. Doors shall have secure catches. Cabinets shall be installed so that the centre of the mirror is approximately 1.6 m above the deck.

SINGLE CABINS

10.3.11 Single berths shall be supplied and installed in all single cabins. Each cabin shall be supplied and fitted with a desk with drawers and desk light, combination safe, desk chair, at least one (1) but up to two (2) kit lockers, a stainless steel washbasin complete with a compact mixer faucet and hot and cold shut-off valves, a toiletry cabinet, a single shelf bookshelf storage (1.5 m L and a minimum of 25 cm D), two (2) clothes hooks, waste bin, internal communications station, one (1) administrative LAN outlet, one (1) telephone outlet and, two (2) television and radio reception outlets fed from the communal entertainment antenna distribution system.

10.3.12 One (1) small-arms secure storage locker for a 9 mm individual pistol shall be supplied and installed in the Program Officer/Incident Commander's cabin. The designated cabin shall be determined by Canada during the outfitting design of the cabins.

10.3.13 One (1) small refrigerator (approximately 0.12 m^3) shall be supplied and installed in both the Captain's and Chief Engineer's Cabins.

10.3.14 The Commanding Officer's, Chief Engineer's and Program Officer/Incident Commander's cabins shall be each be supplied and installed with one (1) 40 watt stereo with two (2) speakers, one (1) CD player, one (1) twenty (20) inch flat screen HD LCD television and one (1) Blu-ray/DVD player.

10.3.15 Allocated storage shall be supplied and installed for one (1) immersion suit and one (1) lifejacket.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

DOUBLE CABINS

10.3.16 A double-tier berth, with a Pullman berth (or equivalent) as the top tier, shall be supplied and installed in each double cabin. Each double cabin shall also be supplied and fitted with a single pedestal desk with drawers, desk light, desk chair and at least two (2) but up to four (4) kit lockers. Each cabin shall be supplied and fitted with a stainless steel wash hand basin complete with a compact mixer faucet and hot and cold shut-off valves, a toiletry cabinet, a single bookshelf (1.5 m L and a minimum of 25 cm D), four (4) clothes hooks, waste bin, internal communications station, two (2) administrative LAN outlets, one (1) telephone outlet, and two (2) television and radio reception outlets fed from the communal entertainment antenna distribution system.

10.3.17 Two (2) separate, secure storage lockers each accommodating a 9 mm individual pistol, or equivalent, and one (1) long rifle shall be fitted in each double cabin.

10.3.18 Allocated storage shall be supplied and installed for two (2) immersion suits and two (2) lifejackets.

WASHROOMS

10.3.19 Four (4) washroom facilities shall be supplied and installed. One (1), located on the main deck in proximity to the Command Centre, shall be fitted with one (1) toilet and one (1) wash basin with all necessary fittings including hot and cold water, water isolating valves, self-closing and washerless faucets, toilet roll holder, grab rails, paper towel dispenser/disposal unit and coat hook. Three (3) washroom facilities shall be fitted with one (1) toilet enclosure with door, one (1) wash hand basin in a vanity type installation with toiletry cabinet and one (1) shower enclosure with curtain. The washroom shall be outfitted with all necessary fittings including hot and cold water, water isolating valves, self-closing and washerless faucets, toilet roll holder, towel rail, grab rails, paper towel dispenser/disposal unit, and coat hook. All facilities shall be supplied and fitted with a sanitary napkin depository and dispenser.

10.3.20 One (1) of the four (4) washroom facilities, complete with shower, shall be supplied and installed adjacent to the Captain's and Chief Engineer's Cabins for their shared use.

MESS

10.3.21 A large mess shall be supplied and built for the crew. The mess shall be cafeteria style with a service opening adjacent to the galley. The mess area shall be adaptable such that it will accommodate ten (10) persons for briefings and interviews.

10.3.22 The mess shall be fitted with moveable chairs and tables having a seating capacity for ten (10). The seating arrangement in the mess shall be configured so that each person has access to his or her place without disturbing another crewmember when everyone is seated. Individuals shall also be able to leave their seat without having to ask someone to move. For this seating arrangement, the tables shall be equipped with a mechanism that will allow them to be temporarily secured to the deck. Furthermore, the furniture in the mess shall have the capability of being struck down and stowed in the mess in order to leave a large, clear deck-space, which may be used for temporary (overnight) accommodations.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

10.3.23 The mess shall be fitted with a pass-through so that the crew can receive their meals and return their dirty dishes to the galley.

10.3.24 The mess shall have a counter with cupboards beneath supplied and installed close to the pass-through. The following items shall be supplied and installed:

a. a stainless steel counter that shall be outfitted with a bar style sink complete with a compact mixer faucet, hot and cold shut-off valves and with space for:

i) one (1) industrial stainless steel four (4) slice toaster to accept regular and oversize items (bagels); and

ii) one (1) electric coffee maker, maximum power of 1200 Watts, water tank size of not less than 2.0 l; and.

iii) one (1) electric soup and food warmer heater with 120 V / 800 Watts, non-stick surface and not less than 12.0 l capacity; and

iv) one (1) microwave oven in stainless steel with inverter turbo defrosts, 34.0 litre minimum capacity and 1200.0 Watts.

b. one (1) cabinet, counter-depth stainless steel refrigerator and freezer with a minimum combined capacity of approximately 563 litres and complete with French doors, glide-out freezer drawer, through the door ice and water dispenser, an easily accessible isolation valve on the refrigerator potable water supply; and

c. one (1) water dispenser column model, approximately 32 cm L x 30 cm D x 102 cm H. It shall be secured to the bulkhead and shall be compatible with approximately 18.5 l bottled water containers. A means of securing the water containers to the bulkhead shall be supplied and installed. Dispensed cold water temperature shall be between 4.0°and 10.0°C; and

d. food preparation area; and

e. one (1) garbage container in plastic complete with a hinged lid. It shall have a minimum capacity of 49.0 l; and

f. stainless steel cupboards to store dry food such as cereal and bread plus cupboards to store glasses, coffee mugs, plates and bowls as detailed at Appendix 4 of the TSOR; and

g. a stainless steel drawer for the stowage of cutlery, utensils and linen as detailed at Appendix 4 of the TSOR.

10.3.25 The mess shall also serve as the crew's recreation space. It shall be designed and built with an area for lounging and shall be supplied and installed with a comfortable upholstered sofa made of leather or other durable material. This area shall also be supplied and installed with an entertainment system cabinet outfitted with:

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

a. a forty (40) watt AM/FM stereo; and

b. a multiple disc Compact Disc (CD) player; and

c. a forty (40) inch flat screen Liquid Crystal Display (LCD) High Definition (HD) television, with provision to provide suitable viewing for the whole mess area; and

d. a Blu-ray/Digital Video Device (DVD) player; and

e. eight (8) speakers, including two extension speakers to the galley.

10.3.26 The mess area shall contain:

a. a computer workstation space; and

b. an administrative LAN drop; and

c. a cork notice board (1.5 m L x 1.0 m H); and

d. a bookcase, two (2) linear metres of shelving at least 25 cm D; and

e. a clock; and

f. curtains made of opaque materials so as not to pass light, complete with tie backs; and

g. dimmable lighting; and

h. television and radio reception points fed from the communal entertainment antenna distribution system.

GALLEY

10.3.27 The galley shall be designed, built and equipped to allow for a single cook to prepare meals, generally composed of two choices of entrée, for a complement of fourteen (14) personnel when the MSPV is operating in conditions as described in Table 1 – Environmental Conditions. Ergonomics, efficiency and galley lay-out shall be optimized when planning the galley design. The galley should be free of overhead trunking and obstructions. Deck areas shall be designed to eliminate cross traffic and bottlenecks, yet retain specific areas designated for specific tasks. The galley shall provide storage spaces for a food locker and for items as detailed at Appendix 5 of the TSOR, meat and vegetable preparation spaces, a pastry and bread making section, cooking spaces, dishwashing spaces and garbage stowage space. The galley shall be supplied and outfitted with the following:

a. one (1) flash-steam combination oven and steamer, including operational modes for steam, convection and a combination of steam and convection heat. Features shall include automatic steam venting and a self-adjusting, flush-mounted rotary door handle with a steam venting safety stop. Controls shall include a 2-speed fan and a cool-down function. The oven shall be constructed of 18 gauge stainless steel, include an attached spray hose with backflow preventer, and an automatic cleaning function. The oven cavity is to

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

accommodate up to six (6) half-size sheet pans, include a removable door gasket for easy replacement, appropriate door hinging, removable quick-connect internal product temperature probe in the oven interior, programming capability and cold water inlet(s); and

b. one (1) stainless steel range exhaust hood shall be fitted above the induction ranges. It shall be fitted with a grease trap, removable and cleanable filters and lights. The range hood shall be connected to the galley exhaust system; and

c. one (1) vertical, upright, stainless steel, marine type refrigerator of 595 l minimum capacity. It shall be fitted with five (5) adjustable shelves, a door latch and interior lighting; and

d. one (1) commercial, stainless steel exterior, combination convection and microwave oven of 34.0 litre capacity minimum. It shall provide up to and including 246.1°C (475°F) of convection cooking with 1400 Watts minimum of microwave heating and shall have an easy to clean interior; and

e. one (1) industrial dishwasher with a heat booster, which shall wash at a temperature of not less than 66.0°C and rinse at a temperature of not less than 82.0°C. The dishwasher shall have two (2) extra racks for cutlery and glasses and top and side panels; and

f. two (2) heavy-duty, stainless steel, commercial, dual hob, vitro ceramic countertop induction ranges with at least 2.5 kW per hob. The ranges shall accommodate two (2) pans each with a maximum diameter of 30.5 cm. The ranges shall be easy to clean; and

g. one (1) stainless steel, industrial, counter electric griddle at least 38 cm x 61 cm x 35 cm. The deep grease drawer shall be concealed behind a front cover door. The griddle shall be easy to clean and have safety features to prevent grease spills; and

h. one (1) stainless steel exterior industrial four (4) slice toaster to accept regular and oversize items (bagels); and

i. one (1) bulkhead-mounted, heavy-duty manual can opener capable of opening a 35 cm diameter can; and

j. one (1) garbage container in plastic with a minimum capacity of 80.0 l with a snap-fit or swinging lid; and

k. one (1) preparation table with a stainless steel base and a wooden "butcher block" counter top, located near the cooking section; and

l. one (1) stainless steel counter beneath the pass-through; and

m. one (1) plate dispenser fitted to one side of the stainless steel counter beneath the pass-through; and

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

n. the pass-through shall be large enough to allow the crew to be served from the galley and to allow crew members to return dirty dishes to the galley concurrently; and

o. one (1) three (3) sink unit, with a single lever mixing valve faucet and spray nozzle attachment on a flexible hose; and

p. one (1) separate sink for hand washing fitted close to the preparation table, with a fixed soap and paper towel dispenser; and

q. one (1) food processor (KitchenAid TM 16 cup food processor KPFP850PM or equivalent); and

r. one (1) scale - portion (Bakers) 1-10 lb (Electronic scale); and

s. one (1) mixer (Hobart N50 Mixer or equivalent); and

t. galley items storage as detailed at Appendix 5 of the TSOR.

10.3.28 The main cooking section shall be close to the point of service.

10.3.29 The sink counter shall be of all stainless steel construction with 150mm backsplash. A three (3) compartment sink unit shall be made of stainless steel with radius corners throughout. Each side sink shall be approximately 50 cm L x 50 cm D x 50 cm H with 60 cm L x 50 cm D drain boards. Two (2) sinks shall each be fitted with a spin waste strainer. The rinsing sink shall be fitted with one (1) industrial-grade garborator of at least 0.75 kW. The garborator shall be totally enclosed to protect against ingress of outside moisture, it shall have a built-in thermal overload protection and it shall be designed for reverse action grinding. The garborator shall be all stainless steel and shall discharge all galley wastes that may contain grease through grease traps to a retaining box prior to discharge into the grey water system. A standard single lever, mixing valve faucet and spray nozzle attachment on a flexible hose shall serve the sink unit.

10.3.30 Equipment abutting other pieces of equipment or furnishings such as table tops, countertops and bulkheads shall have seals installed to avoid grease or soil catching crevices. Panels of quilted stainless steel shall only cover bulkheads behind heat producing equipment. Other bulkheads shall be made of fire retardant material other than stainless steel. The space between the heat producing equipment and the bulkhead shall be sealed against the entry of vermin, cooking ingredients or other extraneous matter.

10.3.31 All sinks, countertops and cupboards shall be constructed of stainless steel. Stainless steel cupboards and tables shall be reinforced, if required, to prevent warping or buckling of surfaces. Unless otherwise specified, they shall be of welded construction. All welds shall be sound, non-porous and free from imperfections. The deposited colour metal shall be corrosion resistant and matched to parent materials. All welds shall be ground and polished to a smooth finish.

10.3.32 Deck coverings shall be evenly laid and well sealed to prevent lifting through continuous use of water and they shall be made of durable and easy to clean material.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

10.3.33 Tables, counters and cupboards shall be supplied and installed to the maximum practical extent. Normal depth of counters accessible from one side shall be approximately 50 cm. Cupboards shall be of stainless steel construction, bulkhead mounted with adjustable shelving, and shall have hinged doors with latches and locking arrangements. Cupboards above the dishwashing area counter shall have dividers sized for dishes. Stowage for pots and pans shall be deep cupboards and drawers with spaces sized for utensils, located as near as possible to the oven and under the stainless steel counter beneath the pass through.

10.3.34 To accommodate the operational and stowage realities of the shipboard environment, the following are required:

a. counter tops and sink units shall be supplied and installed with inverted "V" edges; and

b. splash backs shall be supplied and installed for sinks and counters when sinks are installed against a bulkhead; and

c. all shelving shall be supplied and installed with raised edges; and

d. the front lip of refrigeration racks shall be raised; and

e. large overhead cupboards shall be supplied and installed with retaining bars; and

f. shelves shall be supplied and installed with lips for packaged and canned supplies; and

g. racks shall be supplied and installed for pot lids; and

h. drawers shall be supplied and installed with stainless steel bin inserts for sugar, flour, bread, etc.; and

i. cutlery and tool drawers shall be supplied and installed with internal sectioning and shall be fitted with latches; and

j. shelves and drawers shall be supplied and installed to be removable for easy cleaning. Drawers shall be supplied and installed with stops and latches; and

k. drainage shall be supplied and installed under all plumbed equipment; and

l. electrical outlets shall be installed and installed with waterproof covers. Wiring shall be sealed and encased in waterproof jackets; and

m. light fixtures shall be supplied and installed complete with waterproof seals and safety glass; and

n. grease trays shall be supplied and installed on main cooking equipment; and

o. all doors shall be supplied and installed with strong hooks to secure them when they are open; and

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

p. cupboards and drawers shall be supplied and installed with storage for all the items as detailed at Appendix 5 of the TSOR.

10.3.35 The galley shall be fitted with a small ready use storage space for brooms, mops, buckets and cleaning materials.

COMMAND CENTRE

10.3.36 The Command Centre shall consist of stationary material storage spaces, Program/Incident presentation space, three Program/Incident staff working, writing and operational & administrative LAN spaces, spaces for communications and other electronics equipment and, a briefing area for seven personnel. Its furnishing shall consist of desks and shelving. The Command Control Centre shall be located aft of the Bridge and shall be supplied and installed with the following:

a. a working surface with a minimum size of 1270 mm L x 890 mm D and 910 mm above the deck; and

b. seating for four (4); and

c. one (1) whiteboard cabinet of minimum size 1200 mm W x 900 mm H, mounted 910 mm above the deck; and

d. inside cabinet features with hinged doors and cork bulletin board on the inside of each hinged door; and

e. a space for Program/Incident Commander's workstation with a desktop computer integrated with a supplied and installed digital projector; and

f. two (2), thirty-two (32) inch flat screen HD LCD televisions, two (2) Video Cassette Recorders (VCRs), and one (1) Blu-Ray/DVD players. Remote operation is required for all listed electronic devices; and

g. operational and administrative LANs; and

h. one (1) water dispenser column model, approximately 32 cm L x 30 cm D x 102 cm H. It shall be secured to the bulkhead and shall be compatible with approximately 18.5 litre bottled water containers. A means of securing the water containers to the bulkhead shall be supplied and installed. Dispensed cold water temperature shall be between 4.0°C and 10.0°C; and

i. one (1), four (4) drawer, lockable, heavy duty filing cabinet to hold up to and including SECRET documents as per Government Security Policy; and

j. door access to the Bridge with lock; and

k. a second door, with a thumb-turn lock and a non-opening window, giving access to the outside deck area. Fixed windows shall be supplied and installed to view port, starboard

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

and astern, and shall be arranged so there is sufficient bulkhead space for the whiteboard, workstations and storage. Black out curtains on all Command Centre windows shall be supplied and installed.

BRIDGE

10.3.37 The size and layout of the Bridge shall accommodate both normal operations and Incident/Program Commander operations.

10.3.38 The Bridge shall be supplied and outfitted with navigational aids, communications and electronic equipment as per Section 9 and the following:

a. one (1) chart table with the top at least 1270 mm L x 890 mm D, 910 mm above the deck and with drawers and lockers underneath the table top; and

b. one (1) chart table lamp secured to bulkhead; and

c. three (3) administrative LAN connections not co-located; and

d. one (1) Flag locker; and

e. one (1) bookshelf, at least two (2) m L and 25 cm D; and

f. one (1) BCS to accommodate steering, navigation, communication, alarm, machinery controls and indicators, and auxiliary machinery monitors and controls; and

g. chairs for all consoles. They shall be Admiral Helm, or equivalent, adjustable type seats and a minimum of two (2) in total shall be supplied and installed. A fixed Captain's chair of the same type shall be supplied and installed for the master, positioned on the starboard side, as far forward as possible. It should be of a height to permit the master to see the upper edge of the bow while seated; and

h. one (1) each clock, barometer and barograph; and

i. one (1) inclinometer, the Chaney Instrument Co. Model MK IV or equivalent, shall be supplied and installed; and

j. one (1) magnetic compass shall be supplied and installed on the centreline; and

k. one (1) medical cabinet, including first aid kit shall be supplied and installed; and

l. stowage spaces for sextant, shapes, binocular boxes and lead lines shall be supplied and installed adjacent to the Helmsman's position; and

m. stowage space for binoculars shall be supplied and installed adjacent to the Captain's chair; and

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

n. allocated storage space shall be supplied and installed for two (2) immersion suits and two (2) lifejackets; and

o. storm rails under all windows and at all consoles and control positions.

10.3.39 All navigational and electronic components shall be positioned so that they are readily visible from the BCS and do not obstruct general visibility from any other control position within the space. All navigation equipment and communication equipment that calls for continued use, such as gyro read-out, auto pilot, electronic charts, radar(s), echo sounder, etc., shall be favourably orientated for Bridge operations, and shall have dimmers.

10.3.40 Consoles shall be ergonomically designed and located for efficient and convenient visibility of, and access to, all equipment. Components on the display area of the console shall be logically grouped according to function and operational priorities.

10.3.41 The Bridge Wings shall extend to the ship's sides.

RAT PROOFING

10.3.42 Subject to the configuration of the bulwarks at the fairleads, rat proofing shall be accomplished by the nature of the construction rather than the use of additional fittings, plates and screens. In addition, enclosed inaccessible spaces shall be protected by permanent means. Inaccessible void spaces shall be rat proofed.

10.3.43 Circular openings shall not exceed 25 mm diameter and the side dimensions of square openings shall not exceed 25 mm. Openings in louvers and parallel-sided openings such as around doors and expanded metal bulkheads shall not exceed 10 mm in width. Deck gratings and portable flats in storerooms shall be constructed and fitted so that no openings are wider than 10 mm. Ventilation openings requiring rat proofing shall be fitted with rat proof screens.

10.4 STOREROOMS AND STOWAGE SPACES

GENERAL STORAGE SPACES OUTFIT

10.4.1 Storerooms and stowage spaces including lockers, cupboards and drawers shall be supplied and installed to provide stowage facilities for the ship's provisions, equipment or gear associated with the MSPV's functions. Lockers may be arranged in a common stowage space to afford convenience and economy of space. All storerooms and stowage spaces shall be fitted with locking arrangements. Shelving and stowage bins shall be supplied and installed in the stowage spaces. Stowage spaces shall be supplied and allocated for:

a. two (2) type B First Aid Kits, as per the Canadian Coast Guard Fleet Logistics Standard 400.00.07, metal construction and bulkhead mounted. The first kit shall be installed next to the medical equipment & SAR locker and the other shall be installed as designated by the TA; and

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

b. a medical equipment & SAR locker at least 1.5 m L, 1.5 m D and 2.0 m H with shelves and a door shall be fitted; and

c. a Hazardous Medical Waste Receptacle, approximately 80 l, shall be stored in the medical equipment & SAR locker until proper disposal is later possible; and

d. a main Refrigerator (cool room) for provisions for 14 people for 14 days with adjustable shelves and interior lighting, easy to clean and situated on the same deck as the galley; and

e. a main Freezer (cold room) for provisions for 14 people for 14 days with adjustable shelves and interior lighting and easy to clean and situated on the same deck as the galley; and

f. a Dry Food Store sized to hold dry provisions for 14 people for 14 days situated on the same deck as the galley; and

g. a Central Storeroom sized to hold all items as detailed at Appendix 6 of the TSOR; and

h. a Linen Locker sized to hold all items as detailed at Appendix 7 of the TSOR; and

i. the laundry area shall be supplied and installed with the following:

i) two (2) sets of commercial quality, stackable front-loaded washer and dryers in stainless steel of at least 0.25 m3 each, with extra-large doors and drum openings and with no requirement to use money or debit card to operate. The dryer units shall be vented through a dedicated exhaust system to the MSPV exterior with suitable standpipe and weather tight closure; and

ii) one (1) single, stainless steel compartment sink mounted to the wall, with approximate dimensions 60 cm L x 36 D cm x 60 H cm. It shall drain to the grey water system; and

iii) one (1) heavy duty stainless steel faucet with at least two (2) m stainless steel hose and spray head, to reach and fill buckets on deck; and

iv) one (1) soap and one (1) paper towel dispenser; and

v) stainless steel cupboards and shelves for the stowage of soap, detergent, etc.; and

vi) one (1) folding ironing board fixed to the bulkhead for ironing and folding clothes; and

vii) one (1) closet rod 60 cm L for hanging clothes.

j. Cleaning Gear and Steward's Locker(s) sized to hold all items as detailed at Appendix 8 of the TSOR; and

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

k. one (1) separate lockable Scientific Evidence Freezer (0.8 m^3) with tamper-proof hinges, located inside away from the elements; and

l. an Engineer's Spare Part Store approximately 10.0m^3 for the storage of maintenance gear, rag bins, small parts, fasteners and special instruments and tools; and

m. a minimum of three (3), approximately equally sized, lockers for Deck Stores (a minimum of 7.0 m^3 total) with stowage racks for the stowage of mooring and towing hawsers and other ropes, spare mooring gear, reels, fenders, scramble net, Jacob's Ladders, and two (2) long handled boat hooks and the SAR Equipment as required by Annex E of CCG Fleet Order 207.00 and identified for storage in this space by the CCG Fleet Order; and

n. a small after deck store approximately 1.0 m^3 for towing equipment as required in CCG Fleet Order 207.00 Annex E; and

o. a Paint Locker on the main deck with a separate ventilation system with the appropriate shelving and cabinets for ten (10) x 4.4 litre cans of paint and supplies; and

p. a Wet Gear Storeroom approximately 6.0 m^3 shall be located for direct access from the weather deck. It shall be vented to the outside, in accordance with paragraph 7.11.18, and heated, in accordance with paragraph 7.11.7, and shall be designed and built for direct access from the exposed main deck. It shall drain to the main deck. Racks shall be installed to facilitate the hanging-to-dry of fourteen (14) sets of wet weather gear in a manner that will allow easy potable water wash-down in accordance with paragraph 7.12.6n and drain off. The wet gear will consist of the following:

i) cold weather suit (floater) and work vests; and

ii) rain gear and work vests; and

iii) boots.

q. a Fire Fighting Equipment approximately 2.5 m^3 locker that opens to the weather deck for the firefighting equipment required by the regulations plus the firefighting equipment required by Annex E of CCG Fleet Order 207.00; and

r. a Fuel Oil Spill Control Locker approximately 1.5m^3 for oil-absorbent materials shall be located for direct access from the weather deck; and

s. a Hazardous Material (HAZMAT) locker approximately 1 m^3 accessible from the weather deck; and

t. a small locker approximately 1m x 0.7m x 0.7m on the Bridge for the miscellaneous equipment identified for storage in this space and required by Annex E of CCG Fleet Order 207.00 and pyrotechnics and other Bridge equipment required by Transport Canada; and

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

u. Solid Waste Storage in the Garbage Handling Room, capable of storing four (4) 240 litre wheeled cart containers, and ventilated with weather deck access.

10.4.2 The Steering Gear Compartment may also be used as stowage spaces. All loose material stowed in the Steering Gear Compartment shall be contained in bins or lockers and properly secured to prevent it fouling the steering equipment. Passage between the stowage bins, lockers and steering equipment shall be no less than 610 mm wide and provide adequate maintenance envelope for the equipment installed in the compartment.

FENDERS

10.4.3 Six (6) portable fenders with suitable storage shall be supplied and installed onboard. The fenders supplied shall be approximately 66 cm in diameter and 100 cm H and therefore hold the MSPV approximately 50 cm off of the wharf in up to and including Sea State 2 as detailed at Appendix 3 of the TSOR.

WORKSHOP AND WORK AREA

10.4.4 A deck workshop and work area shall be supplied and installed and furnished with a workbench with the top work area approximately 1200 mm L x 760 mm D, approximately 940 mm above the deck.

10.4.5 One (1) washbasin shall be located close to the workbench.

GARBAGE AND TRASH STOWAGE

10.4.6 The MSPV shall have a well ventilated Garbage Handling Room as defined in TSOR paragraph 7.11.18, with weather deck access, for containers and bins to collect sorted garbage, recyclable material and regular waste, in accordance with CSA Garbage Pollution Prevention Regulations. All garbage stowage areas shall meet the requirements of the Canadian Labour Code Marine Occupational Safety and Health Regulations.

10.4.7 The Garbage Handling Room and trash compactor shall not be located adjacent to or within any messing area. Ventilation shall be fitted to the Garbage Handling Room to prevent accelerated decomposition of stored solid waste and exhaust ventilation shall be located to prevent short-circuiting into the MSPV's air intakes.

10.4.8 Space for four (4) waste containers, each having an internal volume of approximately 227 litres, shall be provided as follows:

a. food waste;

b. paper, books, fine cardboard, newspapers, magazine, corrugated cardboard;

c. metal cans and glass; and

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

d. plastic.

10.4.9 Provisions shall be made on the MSPV to store sorted garbage for the maximum continuous duration of fourteen (14) days for fourteen (14) personnel based on the solid waste generation rate shown in Table 4 below.

Solid Waste Category	Generation Rate by Weight (kg/person-day)	Generation Rate Volume (litres/person-day)
Food	0.55	0.85
Paper and Cardboard	0.50	5.38
Metal and Glass	0.25	1.42
Plastic	0.10	4.25
Textiles	0.06	0.28
Daily Totals	1.46	12.48

TABLE 4 - ESTIMATED WASTE PRODUCTION

MAIN MACHINERY ROOM

10.4.10 A workbench shall be supplied and installed in the MMR with tool cabinet and tool box, with storage supplied and installed for special tools.

10.4.11 The MCR shall be located adjacent to the MMR and shall accommodate the CCAMS MCS. A chair and a steel desk with a durable marine grade laminate top shall be supplied and fitted. The desk dimensions shall be no less than 1.5 m L, 0.6m D, and 0.7 m H. The desk shall be supplied and installed with three (3) full depth drawers located at one end, one drawer shall be able to hang legal size folders. The desk shall be supplied and installed with an under mount, adjustable, retractable computer keyboard tray. The desk shall be well lit, with two (2) spare 115 V power outlets over and above the power supplies for necessary equipment.

A.1 RIGID HULL INFLATABLE BOAT (RHIB) MARINE SECURITY VARIANT

The following are the required additional features to the base model of the Zodiac Hurricane H753 SAR Version.

ITEM	DESCRIPTION
Environmental Conditions	• Shall be capable of day and night operations in the following conditions: o Ambient air temperature range: -20.0°C to 35.0°C o Ambient water temperature range: -1.8°C to 30.0°C o Sea State 6 as detailed at Appendix 3 of the TSOR o Freezing spray or freezing rain with accumulations of up to 6.0mm while maintaining stability to allow for safe transit in Sea State 4 as detailed at Appendix 3 of the TSOR
Performance	• When fully loaded, range shall be at least 100.0 nm at 25.0 kts with 10% fuel reserve remaining • Shall be capable of maintaining maximum speed for up to and including 2 hours
Hull	• Shall be grey in colour • Deck covering shall be SKYDEX • The Kevlar© fibreglass beaching shoe that comes as standard equipment shall be grey in colour
Collar	• Shall be grey in colour • Shall be the foam-filled Durarib upgrade option • Shall have full-length anti-abrasion rubber strips fitted to both sides • The bottom of the collar and all wetted surfaces of the tube shall be fitted with a protective layer of material (EPDM or equivalent)
Seating	• Seating shall be in a 2 X 2 layout, 2 forward of the lifting arch, 2 aft • On the starboard side, a jockey style shock-absorbing type helm seat with control console shall be fitted side-by-side with another jockey style shock-absorbing seat with a combined Communications/Navigation console • The forward set of seats and consoles shall be a sufficient distance forward of the lifting arch and quick-release apparatus such that operators do not impact that arch while seated and underway in any sea conditions • The aft set of non-folding, jockey style shock-absorbing type seats with enclosed, lockable storage shall be fitted side by side immediately behind the forward set of seats and shall be similarly distanced from the lifting arch and quick-release apparatus such that the riders are not in danger of impacting those items in any sea conditions • Each seat shall have foldable foot rests • Hand bar(s) shall be fitted for each rider • Each seat shall have waterproof ballistic nylon seat covering or material of equivalent durability and waterproofing
Consoles	• Each console face shall be at an angle that maximizes console control operability, comfort and visibility when rider is in both a standing or sitting position

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

	• Communication and navigational equipment shall be flush mounted into the consoles whenever possible, shall be weatherproof and, shall be supplied with protective coverings that are easily removable and lockable • Shall be manufactured from marine grade aluminum or fibreglass • One (1) additional accessory plug with screw on watertight cap shall be installed in the Helm console
Engines, Propellers & Steering Rams	• Each RHIB shall be fitted with twin 200 HP 4-stroke gasoline outboard engines of a type currently supported within Canada • Each outboard engine shall meet US EPA regulations for the control of emissions for marine spark ignition engines • There shall be an engine shut down, kill switch, mounted on the helm console • The propellers shall be stainless steel and of a pitch and diameter sufficient to achieve a speed of at least 45 kts in calm salt water, zero wind, when fully fuelled and, when carrying maximum payload of 500.0 kg including four (4) personnel and equipment • If not already supplied as standard equipment, there shall be individual propulsion leg trim controls and a SYNCRO trim switch to integrate the two (2) drive leg trim controls on one (1) switch • If not already supplied as standard equipment, the following instrumentation shall be supplied and installed on the driver's console: o Tachometer for each engine o Water pressure gauge for each engine o Hour meter for each engine o Ignition harness (mounted so that the ignition system cannot collect water) o Trim gauge o Fuel tank gauge(s) • RHIB draft with engines lowered shall be a maximum of one (1) metre • RHIB draft with engines raised shall be a maximum of 0.6 metres • Steering system rams shall have replaceable seals on the rams
Fasteners	• All fasteners shall be metric
Launch & Recovery Arrangements	• When fully fuelled (504 litres) and carrying maximum payload of 500.0 kg including four (4) personnel and equipment, the RHIB itself and all its launch/recovery arrangements and components shall be structurally capable of safely launching and recovering RHIBs in up to and including Sea State 5 at a vessel speed of up to five (5.0) kts • Shall be fully compatible with the MSPV's RHIB launch & recovery system • Shall be fully compatible with the MSPV's RHIB stowage arrangement
Antennas	• Three (3) shall be supplied and fitted to the righting arch o VHF for marine radio to comply with TCMS o UHF for RCMP radio o UHF for local law enforcement agency radio • Contractor shall supply and install all cabling and connectors from righting arch to communications console
Communications	• Contractor shall supply and install one (1) RayMarine model 215 DSC Marine

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

	VHF radio, or equivalent • Contractor shall supply and install one (1) RayMarine model 430 Loud Hailer, or equivalent • Contractor shall supply and install one (1) DSM300 Digital Sound Module, or equivalent that interfaces with a Garmin integrated navigation package • Contractor will be later advised with respect to dimensional and power requirements for Contractor installation in the communications console of two (2) Government UHF radios
Navigation	• Contractor shall supply and install a four (4) kW Garmin radar and enclosed dome mounted on or above the righting arch • Contractor shall supply and install the Garmin radar display in the Navigation console and it shall be fully integrated to the radar, chart plotter and sonar through a Garmin integrated navigation package • Contractor shall supply and install a GPS antenna and receiver that is interfaced with the Garmin navigation package
Operations	• Contractor shall supply and install one (1) AIS 250 automatic identifier receiver • Contractor shall supply and install on the righting arch one (1) additional blue law enforcement high intensity strobe light • Contractor shall ensure that the supplied searchlight fitted to the righting arm is at least 1,000,000 candela and that the searchlight is remotely controllable • The remote control(s) for the searchlight shall be positioned such that the searchlight is operable by both the driver and the navigator from their seated positions • The two (2) Contractor-supplied handheld searchlights shall be 12V and at least 1,000,000 candela each • Additional deck floodlights shall be supplied and installed such that there are two (2) each for forward, aft, port & starboard for eight (8) in total
Miscellaneous	• The fuel filling inlets shall be fitted at the bow locker location onboard and shall be lockable • Fuel shutoff valves shall be installed at fuel tank outlets and must be readily accessible by vessel operators • The Contractor shall ensure the electromagnetic compatibility of all fitted navigation, communication, operations equipment and associated components • Retro-reflective tape shall not be affixed to any part of the RHIB • All electrical wiring shall be protected and all connections shall be waterproof • The Contractor-supplied electric bilge pumps shall be capable of pumping at least 4500 litres per hour and shall be installed one (1) per hull compartment • The electric bilge pump control switch shall be fitted to the driver's console with settings for 'on', 'off' and 'automatic operation'. There shall be an automatic float switch control fitted such that the electric bilge pump operates whenever the pump control switch is set to auto and there is water in the bilge • There shall be means fitted such that it is possible to drain both the forward and after hull compartments when the RHIB is out of the water • The RHIB shall be supplied and fitted with one (1) 2.5 m retractable type boat hook and two (2) paddles with securing holders

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

	• In addition to the supplied fire extinguisher, two (2) Class 1 BC, marine type fire extinguishers and two (2) associated stowage holders shall be supplied and installed

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

A.2 MISSION PERCENTAGES, PROFILES AND VESSEL UTILISATION

Primary Mission 75%: Fisheries Conservation and Protection Duties

Profile 1 – Day operation (a single 24 hour operation and return to port)	**Duration hrs**	**Speed kts**
Transit from Port to operating area	6	20.0
Loiter in operating area	8	2.0
Inter-area transit (economical speed)	4	14.0
Transit to Port from operating area	6	20.0

Profile 2 – Week operation (7 days away from port)	**Duration hrs**	**Speed kts**
Transit from Port to operating area	6	20.0
Inter-area transit (economical speed)	34	14.0
Loiter in operating area	24	2.0
Anchor in operating area	72	0
Berthed in port (away from home port)	24	0
Transit to Port from operating area	8	20.0

Profile 3 – 14 day operation	**Duration hrs**	**Speed kts**
Transit from Port to operating area	6	20.0
Inter-area transit (economical speed)	72	14.0
Loiter in operating area	94	2.0
Anchor in operating area	84	0
Berthed in port (away from home port)	72	0
Transit to Port from operating area	8	20.0

Secondary Mission 25%: Search and Rescue

Profile 4 – 4 day operation from home port	**Duration hrs**	**Speed kts**
Transit from Port to Rescue area	24	25.0
Rescue area search	62	4.0
Transit to nearest Port from rescue area	10	14.0

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Vessel Utilisation

At Sea:

Profile	Missions	Total days/ year
1	25	25
2	12	84
3	10	140
4	10	40
Other (same as profile 1)	20	20
Totals	77	309

Out of service:

Maintenance/refit: 35 days per year

Out of Service means that the vessel is not available for sea service and the vessel can be docked. Major equipment can be overhauled without expecting recall to service within the advised notice for service.

In Harbour:

Holidays, crew change, training, etc.: 21 days per year

It is considered that when the vessel is in harbour, it is available for sea service on not more than 60 minutes notice for departure. This means that the vessel is fully fuelled and stocked with provisions and mechanically available.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

A.3 SEA STATE TABLE

From "Sea Loads on Ships and Offshore Structures"
O.M. Faltinsen – Professor, Department of Marine Technology
Norwegian Institute of Technology

Table 2.3. Annual sea state occurrences in the North Atlantic and North Pacific (Lee et al., 1985)

Sea state no.	Significant wave height (m)		Sustained wind speed (knots)[a]		North Atlantic			North Pacific		
					Percentage probability of sea state	Modal wave period (s)		Percentage probability of sea state	Modal wave period (s)	
	Range	Mean	Range	Mean		Range[b]	Most probable[c]		Range[b]	Most probable[c]
0–1	0–0.1	0.05	0–6	3	0.70	—	—	1.30	—	—
2	0.1–0.5	0.3	7–10	8.5	6.80	3.3–12.8	7.5	6.40	5.1–14.9	6.3
3	0.5–1.25	0.88	11–16	13.5	23.70	5.0–14.8	7.5	15.50	5.3–16.1	7.5
4	1.25–2.5	1.88	17–21	19	27.80	6.1–15.2	8.8	31.60	6.1–17.2	8.8
5	2.5–4	3.25	22–27	24.5	20.64	8.3–15.5	9.7	20.94	7.7–17.8	9.7
6	4–6	5	28–47	37.5	13.15	9.8–16.2	12.4	15.03	10.0–18.7	12.4
7	6–9	7.5	48–55	51.5	6.05	11.8–18.5	15.0	7.00	11.7–19.8	15.0
8	9–14	11.5	56–63	59.5	1.11	14.2–18.6	16.4	1.56	14.5–21.5	16.4
>8	>14	>14	>63	>63	0.05	18.0–23.7	20.0	0.07	16.4–22.5	20.0

[a] Ambient wind sustained at 19.5 m above surface to generate fully-developed seas. To convert to another altitude, H_2, apply $V_2 = V_1(H_2/19.5)^{\frac{1}{7}}$.
[b] Minimum is 5 percentile and maximum is 95 percentile for periods given wave height range.
[c] Based on periods associated with central frequencies included in Hindcast Climatology.

A.6 CENTRAL STOREROOM

Central Storeroom space, complete with supplied and installed lockers, storage racks and shelves, shall be allocated within the MSPV to provide stowage for all listed items of protective clothing.

Protective Clothing Description	Quantity
Aprons - Food Handlers, White	6
Boots - Safety, Rubber, Hip	6
- Safety, Rubber, Knee	6
Cap - Food Handler	1 box of paper hats
Coveralls – Blue: 2 of each size (36 reg, 36 long, 40 short, 40 reg, 40 long, 44 short, 44 reg, 44 long, 48 short, 48 reg, 48 long)	22
Gloves:	
Cloth, Work	12
Leather, Work	12
Rubber, Small	3
Rubber, Medium	3
Rubber, Large	3
Helmet:	
Safety, White	3
Safety, Yellow	3
Strap - Chin, Safety Helmet	6
Liner - Safety Helmet	6
Overalls - Wet Weather: 1 of each size (36 reg, 36 long, 40 short, 40 reg, 40 long, 44 short, 44 reg, 44 long, 48 short, 48 reg, 48 long	11
Jacket Rain: 1 of each size (36 reg, 36 long, 40 short, 40 reg, 40 long, 44 short, 44 reg, 44 long, 48 short, 48 reg, 48 long)	11
Vest - Work , Floatation: (2 x size 36, 5 x size 40, 5 x size 44, 2 x size 48)	14
Cold Weather Suit (Floater): (2 x size 36, 5 x size 40, 5 x size 44, 2 x size 48)	14
Potable water bottles for water coolers (18.5 litres/bottle)	11

A.7 LINEN LOCKER

Linen Locker shall be supplied and installed, complete with storage racks and shelves, to provide stowage for all listed items. The preferred locker location is in the vicinity of the Accommodation areas.

Description	**Quantity**
Heavy Quilted Bedspreads	16
Mattress covers	16
3 types of contour sheets: 22 cotton, 10 flannel, 10 micro fibre	42
3 types of flat sheets: 22 cotton, 10 flannel, 10 micro fibre	42
2 types of blankets: 6 wool and 8 polar	14
Pillows	4
Pillow covers	16
Pillow cases	16
Bath towels	32
Hand Towels	16
Face cloths	16
Bath mats	4
Laundry bags	16
Shower curtains	2
Shower curtain rings	20
Curtains for windows and portlights	4 spare curtains for windows and portlights
Curtains for the cabin doors	2 spare door curtains

A.8 CLEANING GEAR AND STEWARD'S LOCKER(S)

CLEANING SUPPLIES and STEWARD'S LOCKER(S)
Locker(s), complete with racks and shelves, shall be supplied and installed to provide stowage for all listed items. The preferred locker location(s) is in the vicinity of the Galley or the Accommodation area.

Cleaning Supplies	Quantity		Steward's Stores	Quantity
Bag – Garbage, green	150		Batteries Flashlight, D cell	12
Bleach – Javex ™, 3.0 l, bottles	10		Flashlights (1 per berth)	14
Cleaning Compound			Broom	
Oven (liquid foam), cans	7		Corn, Whisk	2
Glass, Liquid, 1.0 l, bottles	7		Corn	2
Detergent			Push 14''	3
General purpose, liquid, 1.0 l, bottles	14		Push Broom	3
Laundry, powder, kgs	8		Brush	
Dishwashing Compound			Bannister	2
Liquid, 1.0 l, bottles	10		Toilet brush c/w holder	1 per washroom
Machine, powder, kgs	4		Scrub 6 ''	6
Disinfectant			Scrub 10''	4
Germicidal and Fungicidal	1 gallon		Turkshead 5'' c/w handle	6
Hand Cleaner			Bucket	
Abrasive, 1.0 l, bottles	6		Oval Mop c/w wheels	3
Waterless, 1.0 l, bottles	6		Wringer for Oval Bucket	1
Napkins, Paper	1 case		Mop	
Paper			Wet Spring Type	2
Toilet, 2-ply	72 rolls		Wet, Head Cotton	4
Wax, HD 18'' x 100'	1 roll		Dry, Dust 14 ''	2
Towel - Paper	1 case		Yacht, Cotton	4
Polish			Padlocks	6
Metal , Brass, 0.5 l, cans	2		Pail - Plastic , 8-10 qt.	6
Metal , Silver, 0.5 l, cans	2		Pans - Dust	4
Stainless Steel (Aerosol)	1 litre		Plunger, Toilet	4
Soap			Rags, Wiping	1 case
Toilet, White, bars	72		Scissors, 12''	1 per desk
Wrap			Scrubber - Deck c/w Rubber Squeeze and Handle.	4
Aluminum Foil, 18'' x 450'	1 roll		J-cloths	24 packs
Cellophane, 18" x 1000'	1 roll		Sponge, synthetic	12
			Pot Scrubbers, Metal Brass	12

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Cleaning Supplies	Quantity		Steward's Stores	Quantity
			Squeegee - Glass 10 '' c/w handle	2
			Vacuum Cleaner - Wet/ Dry type c/w attachments	2 (one 5 and one 8 gallons)

RULES FOR CLASSIFICATION OF

High Speed, Light Craft and Naval Surface Craft

PART 0 CHAPTER 6

INTRODUCTION

IMO High Speed Craft Code

JANUARY 2011

This chapter has been amended since the main revision (January 2011), most recently in July 2011.
See "Changes" on page 3.

FOREWORD

DET NORSKE VERITAS (DNV) is an autonomous and independent foundation with the objectives of safeguarding life, property and the environment, at sea and onshore. DNV undertakes classification, certification, and other verification and consultancy services relating to quality of ships, offshore units and installations, and onshore industries worldwide, and carries out research in relation to these functions.

The Rules lay down technical and procedural requirements related to obtaining and retaining a Class Certificate. It is used as a contractual document and includes both requirements and acceptance criteria.

CHANGES

General

As of October 2010 all DNV service documents are primarily published electronically.

In order to ensure a practical transition from the "print" scheme to the "electronic" scheme, all rule chapters having incorporated amendments and corrections more recent than the date of the latest printed issue, have been given the date January 2011.

An overview of DNV service documents, their update status and historical "amendments and corrections" may be found through http://www.dnv.com/resources/rules_standards/.

Amendments July 2011

- **General**

— The restricted use legal clause found in Pt.1 Ch.1 Sec.4 has been added also on the front page.

Main changes

Since the previous edition (July 2008), this chapter has been amended, most recently in January 2009. All changes previously found in Pt.0 Ch.1 Sec.3 have been incorporated and a new date (January 2011) has been given as explained under "General".

In addition, the layout has been changed to one column in order to improve electronic readability.

SECTION 1
PRINCIPLES OF APPLICATION OF THE HSC CODE

A. General

A 100 HSLC rules

101 The HSLC rules are applicable to a variety of craft, some under international conventions, some under domestic legislation only and others under no regulations other than voluntary classification rules. This section states the principles of application of the HSLC rules and relation to the HSC Code.

102 The basic requirements of the rules given by the class notation **1A1** as specified by Part 2, 3 and 4 are valid for all craft regardless of the safety certificate to be issued.

103 The type and service notations **Passenger, Cargo, Patrol** etc. specify the general requirements to the craft in addition to the **1A1** requirements.

104 The additional equipment requirements **E0, NAUT** etc. specify extra voluntary requirements to any HSLC.

A 200 DSC Code

201 The Code of Safety for Dynamically Supported Craft (DSC Code) has been the basis for the HSLC rules in the period from the 1985 edition to the 1996 edition of the rules.

202 This DSC Code does not apply to any craft the keel of which is laid or which is subject to repairs, alterations or modifications of a major character, on or after 96.01.01.

203 For craft constructed and in service under the DSC Code, this Code is still valid standard although guidance in the interpretation of the DSC Code may be obtained from the HSC Code.

A 300 HSC Code

301 The International Code of Safety for High Speed Craft (HSC Code) replaces the DSC Code as basis for HSLC under international legislation.

302 The HSC Code applies from 1 July 1996 to the notations **Passenger, Car Ferry** and **Cargo** in international trade for the distance from safe harbour in accordance with the Code.

303 The HSC Code does not apply to the full extent to the notations **Crew, Yacht** and **Patrol** although many of the requirements are equivalent.

304 The present HSLC rules reflect the basic philosophy of the HSC Code and the requirements are applied in the various Parts and Chapters of the rules to the extent found applicable by the Society.

305 Text quoted from the International Code of Safety for High Speed Craft is printed in *italics*.

B. Application

B 100 Non-convention craft

101 Craft with the type and service notations **Patrol, Yacht** and **Crew** may be given a letter of compliance on those parts of the HSC Code which may have been applied for the actual craft.

B 200 Domestic trade

201 HSLC with the notations **Passenger, Car Ferry** or **Cargo** in domestic trade and service restriction **R3, R4** or **R5** may be classed based on compliance with domestic legislation as far as this is found equivalent to the standard of the HSC Code by the flag state.

202 Such equivalent requirements shall be referred to in the appendix of the class certificate and the corresponding requirements of the rules which they replace and it is to be specified that the craft is built for domestic trade.

B 300 International trade

301 For international trade compliance with the HSC Code shall be provided. Full compliance with the technical part of the HSC Code covered by the class is provided for craft with service restrictions **R0, R1** and **R2**.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Guidance note:
Additional requirements given by other Codes and Conventions than SOLAS such as ILLC and MARPOL may be applicable to the craft as decided by the flag state.

C. IMO Regulations

C 100 Chapter X of SOLAS

101 The HSC Code becomes a mandatory part of SOLAS by chapter X, of which the relevant part is quoted below:

SAFETY MEASURES FOR HIGH SPEED CRAFT

Regulation 1 - Definitions

For the purpose of this chapter:

1 *'High Speed Craft Code (HSC Code)' means the International Code of Safety for High Speed Craft adopted by the Maritime Safety Committee of the Organization by resolution MSC.36(63), as may be amended by the Organization, provided that such amendments are adopted, brought into force and take effect in accordance with the provisions of article VIII of the present Convention concerning the amendment procedures applicable to the Annex other than chapter I.*

2 *'High speed craft' is a craft capable of maximum speed equal to or exceeding:*

$$3.7\ \nabla^{0.1667} \quad \text{(m/s)}$$

where:

∇ = *displacement corresponding to the design waterline (m^3).*

3 *The expression 'craft constructed' means a craft the keel of which is laid or which is at a similar stage of construction.*

4 *The term 'similar stage of construction' means a stage at which:*

.1 *construction identifiable with a specific craft begins; and*

.2 *assembly of that craft has commenced comprising at least 50 tonnes or 1% of the estimated mass of a/ / structural material, whichever is less.*

Regulation 2 - Application

1 *This chapter applies to high speed craft constructed on or after 1 January 1996 which are engaged in international voyages.*

C 200 Preamble of the HSC Code

1 *The international conventions ratified in respect of conventional ships and the regulations applied as a consequence of such conventions have largely been developed having in mind the manner in which conventional ships are constructed and operated. Traditionally, ships have been built of steel and with the minimum of operational controls. The requirements for ships engaged on long international voyages are therefore framed in such a way that, providing the ship is presented for survey and a ship safety certificate is issued, the ship may go anywhere in the world without any operational restrictions being imposed. Providing the ship is not involved in a casualty, all that is needed is that it is made available to the Administration for the purpose of a satisfactory resurvey before the ship safety certificate expires and the certificate will be reissued.*

2 *The traditional method of regulating ships should not be accepted as being the only possible way of providing an appropriate level of safety. Nor should it be assumed that another approach, using different criteria, could not be applied. Over a long period of years, numerous new designs of marine vehicles have been developed and have been in service. While these do not fully comply with the provisions of the international conventions relating to conventional ships built of steel, they have demonstrated an ability to operate at an equivalent level of safety when engaged on restricted voyages under restricted operational weather conditions and with approved maintenance and supervision schedules.*

3 *This Code has been derived from the previous Code of Safety for Dynamically Supported Craft (DSC) adopted by IMO in 1977. The Code recognized that safety levels can be significantly enhanced by the infrastructure associated with regular service on a particular route, whereas the conventional ship safety philosophy relies on the ship being self-sustaining with all necessary emergency equipment being carried on board. This revised Code has been prepared in recognition of the growth in size and types of high speed craft now existing and is intended to facilitate future research and development of fast sea transportation in order that they may be accepted internationally.*

4 *The safety philosophy of this Code is based on the management and reduction of risk as well as the traditional*

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

philosophy of passive protection in the event of an accident. Management of risk through accommodation arrangement, active safety systems, restricted operation, quality management and human factors engineering should be considered in evaluating safety equivalent to current conventions. Application of mathematical analysis should be encouraged to assess risk and determine the validity of safety measures.

5 *The Code takes into account that a high speed craft is of a fight displacement compared with a conventional ship. This displacement aspect is the essential parameter to obtain fast and competitive sea transportation and consequently this Code allows for use of non-conventional shipbuilding materials, provided that a safety standard at least equivalent to conventional ships is achieved.*

6 *To clearly distinguish such craft, criteria based on speed and volumetric Froude number have been used to delineate those craft to which this Code applies from other, more conventional, craft.*

7 *The Code requirements also reflect the additional hazards which may be caused by the high speed compared with conventional ship transportation. Thus, in addition to the normal requirements including life-saving appliances, evacuation facilities, etc., provided in case of an accident occurring, further emphasis is placed on reducing the risk of hazardous situations arising. Some advantages result from the high speed craft concept, i.e. the light displacement provides a large reserve buoyancy in relation to displacement, reducing the hazards addressed by the International Load Line Convention. The consequences of other hazards such as of collision at high speed are balanced by more stringent navigational and operational requirements and specially developed accommodation provisions.*

8 *The above-mentioned safety concepts were originally reflected in the Code of Safety for Dynamically Supported Craft. The development of novel types and sizes of craft has led to the development of pressures within the maritime industry for craft which are not dynamically supported cargo craft, passenger craft carrying larger numbers of passengers or operating further afield than permitted by that Code to be certified according to those concepts. Additionally, improvements of maritime safety standards since 1977 were required to be reflected in the revisions of the Code to maintain safety equivalence with conventional ships.*

9 *Accordingly, two differing principles of protection and rescue were developed.*

10 *The first of these recognizes the craft which were originally foreseen at the time of development of the DSC Code. Where rescue assistance is readily available and the total number of passengers is limited, a reduction in passive and active protection may be permitted. Such craft are called "assisted craft" and form the basis for "category A passenger craft" of this Code.*

11 *The second concept recognizes the further development of high speed craft into larger craft. Where rescue assistance is not readily available or the number of passengers is unlimited, additional passive and active safety precautions are required. These additional requirements provide for an area of safe refuge on board, redundancy of vital systems, increased watertight and structural integrity and full fire-extinguishing capability. Such craft are called "unassisted craft" and form the basis for "cargo craft" and "category B passenger craft" of this Code.*

12 *These two concepts of the Code have been developed as a unified document on the basis that an equivalent level of safety to that normally expected on ships complying with the International Convention for the Safety of Life at Sea is achieved. Where the application of new technology or design indicates an equivalent safety level to the strict application of the Code, the Administration is permitted to formally recognize such equivalence.*

13 *It is important that an Administration, in considering the suitability of a high speed craft under this Code, should apply all sections of the Code because non-compliance with any part of the Code could result in an imbalance which would adversely affect the safety of the craft, passengers and crew. For a similar reason, modifications to existing craft, which may have an effect on safety, should be approved by the Administration.*

14 *In developing the Code, it has been considered desirable to ensure that high speed craft do not impose unreasonable demands on existing users of the environment or conversely suffer unnecessarily through lack of reasonable accommodation by existing users. Whatever burden of compatibility there is, it should not necessarily be laid wholly on the high speed craft.*

C 300 Chapter 1 of the HSC Code: "General comments and requirements"

301 The following text is quoted from Chapter 1 of the HSC Code:

1.1 General comments

This Code should be applied as a complete set of comprehensive requirements. It contains requirements for the design and construction of high speed craft engaged on international voyages, the equipment which should be provided and the conditions for their operation and maintenance. The basic aim of the Code is to set levels of safety which are equivalent to those of conventional ships required by the International Convention for the Safety of Life at Sea, 1974, as amended, (SOLAS Convention) and International Convention on Load Lines, 1966 (Load Line Convention) by the application of constructional and equipment standards in conjunction with strict operational controls.

These rules contain additional requirements compared to the HSC Code to fulfil the expressed aim of the HSC Code to be a complete alternative to both the SOLAS Convention and the Load Line Convention. The additional requirements are related to the main watertight bulkheads including collision bulkhead, watertight

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

and weathertight closing appliances such as doors and hatches, window glass thicknesses and the amount of reserve buoyancy provided by the freeboard as required by the previous Code of Safety for Dynamically Supported Craft (the DSC Code), adopted as IMO res. A.373(X).

The HSC Code does not aim to cover requirements related to pollution prevention, and the MARPOL Convention has to be dealt with separately.

1.2 General requirements

The application of the provisions of this Code is subject to the following general requirements that:

.1 *the Code will be applied in its entirety:*

.2 *the management of the company operating the craft exercises strict control over its operation and maintenance by a quality management system *;*

.3 *the management ensures that only persons qualified to operate the specific type of craft used on the intended route are employed;*

.4 *the distances covered and the worst intended conditions in which operations are permitted will be restricted by the imposition of operational limits;*

.5 *the craft will at all times be in reasonable proximity to a place of refuge;*

.6 *adequate communications facilities, weather forecasts and maintenance facilities are available within the area of operation;*

.7 *in the intended area of operation there will be suitable rescue facilities readily available;*

.8 *areas of high fire risk such as machinery spaces and special category spaces are protected with fire-resistant materials and fire-extinguishing systems to ensure, as far as is practicable, containment and rapid extinguishing of fire;*

.9 *efficient facilities are provided for the rapid and safe evacuation of all persons into survival craft;*

.10 *that all passengers and crew are provided with seats;*

.11 *that no enclosed sleeping berths for passengers are provided;*

.12 *where the Administration has made a comprehensive review of the adequacy of the fire safety measures and evacuation procedures for the crew accommodation, sleeping berths for crew may be permitted.*

* *Refer to the International Safety Management (ISM) Code adopted by the Organization (IMO) by resolution A.741(18)*

1.3 Application

1.3.1 *This Code applies to high speed craft which are engaged in international voyages.*

1.3.2 *This Code applies to:*

.1 *passenger craft which do not proceed in the course of their voyage more than 4 h at operational speed from a place of refuge when fully laden; and*

.2 *cargo craft of 500 tons gross tonnage and over which do not proceed in the course of their voyage more than 8 h at operational speed from a place of refuge when fully laden.*

1.3.3 *This Code, unless expressly provided otherwise, does not apply to:*

.1 *craft of war and troopcraft;*

.2 *craft not propelled by mechanical means;*

.3 *wooden craft of primitive built;*

.4 *pleasure craft not engaged in trade; and*

.5 *fishing craft.*

1.3.4 *This Code does not apply to craft solely navigating the Great Lakes of North America and the River St. Lawrence as far east as a straight line drawn from Cap des Rosiers to West Point, Anticosti Island and, on the north side of Anticosti Island, the 63rd meridian.*

1.3.5 *The application of this Code should be verified by the Administration and be acceptable to the Governments of the States to which the craft will be operating.*

1.4 Definitions

For the purpose of this Code, unless expressly provided otherwise, the terms used therein have the meanings defined in the following paragraphs. Additional definitions are given in the general parts of the various chapters.

1.4.1 *"Administration" means the Government of the State whose flag the craft is entitled to fly.*

1.4.2 *"Air-cushion vehicle" (ACV) is a craft such that the whole or a significant part of its weight can be supported, whether at rest or in motion, by a continuously generated cushion of air dependent for its effectiveness on the proximity of the surface over which the craft operates.*

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.4.3 *"Auxiliary machinery spaces" are spaces containing internal combustion engines of power output up to and including 110 kW driving generators, sprinkler, drencher or fire pumps, bilge pumps, etc., oil filling stations, switchboards of aggregate capacity exceeding 800 kW, similar spaces and trunks to such spaces.*

1.4.4 *"Auxiliary machinery spaces having little or no fire risk" are spaces such as refrigerating, stabilizing, ventilation and air conditioning machinery, switchboards of aggregate capacity 800 kW or less, similar spaces and trunks to such spaces.*

1.4.5 *"Base port" is a specific port identified in the route operational manual and provided with:*

.1 *appropriate facilities providing continuous radio communications with the craft at all times while in ports and at sea;*

.2 *means for obtaining a reliable weather forecast for the corresponding region and its due transmission to all craft in operation;*

.3 *for a category A craft, access to facilities provided with appropriate rescue and survival equipment; and*

.4 *access to craft maintenance services with appropriate equipment.*

1.4.6 *"Base port State" means the State in which the base port is located.*

1.4.7 *"Breadth (B) means breadth of the broadest part of the moulded watertight envelope of the rigid hull, excluding appendages, at or below the design waterline in the displacement mode with no lift or propulsion machinery active.*

1.4.8 *"Cargo craft" is any high speed craft other than passenger craft, and which is capable of maintaining the main functions and safety systems of unaffected spaces, after damage in any one compartment on board.*

1.4.9 *"Cargo spaces" are all spaces other than special category spaces used for cargo and trunks to such spaces.*

1.4.10 *"Category A craft" is any high speed passenger craft:*

.1 *operating on a route where it has been demonstrated to the satisfaction of the flag and port States that there is a high probability that in the event of an evacuation at any point of the route, all passengers and crew can be rescued safely within the least of:*

- *the time to prevent persons in survival craft from exposure causing hypothermia in the worst intended conditions,*
- *the time appropriate with respect to environmental conditions and geographical features of the route, or*
- *4 h; and*

.2 *carrying not more than 450 passengers.*

1.4.11 *"Category B craft" is any high speed passenger craft, other than a category A craft, with machinery and safety systems arranged such that, in the event of damage disabling any essential machinery and safety systems in one compartment, the craft retains the capability to navigate safely.*

1.4.12 *"Continuously manned control station" is a control station which is continuously manned by a responsible member of the crew while the craft is in normal service.*

1.4.13 *"Control stations" are those spaces in which the craft's radio or navigating equipment or the emergency source of power and emergency switchboard are located, or where the fire recording or fire control equipment is centralized, or where other functions essential to the safe operation of the craft such as propulsion control, public address, stabilization systems, etc., are located.*

1.4.14 *"Convention" means the International Convention for the Safety of Life at Sea, 1974, as amended.*

1.4.15 *"Crew accommodation" are those spaces allocated for the use of the crew, and include cabins, sick bays, offices, lavatories, lounges and similar spaces.*

1.4.16 *"Critical design conditions" means the limiting specified conditions chosen for design purposes, which the craft should keep in displacement mode. Such conditions should be more severe than the worst intended conditions by a suitable margin to provide for adequate safety in survival condition.*

1.4.17 *"Design waterline" means the waterline corresponding to the maximum operational weight of the craft with no lift or propulsion machinery active and is limited by the requirements of chapters 2* (Pt.3 Ch.6 Sec.1) *and 3* (Ch.4 Sec.4).

1.4.18 *"Displacement mode" means the regime, whether at rest or in motion, where the weight of the craft is fully or predominantly supported by hydrostatic forces.*

1.4.19 *"Failure mode and effect analysis (FMEA)" is an examination, in accordance with annex 4 (*Ch.4 Sec.2*), of the craft's systems and equipment to determine whether any reasonably probable failure or improper operation can result in a hazardous or catastrophic effect.*

1.4.20 *"Flap" means an element formed as integrated part of, or an extension of, a foil, used to adjust the hydro- or aerodynamic lift of the foil.*

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.4.21 *"Flashpoint" means a flashpoint determined by a test using the closed cup apparatus referenced in the International Maritime Dangerous Goods (IMDG) Code.*

1.4.22 *"Foil" means a profiled plate or three dimensional construction at which hydrodynamic lift is generated when the craft is under way.*

1.4.23 *"Fully submerged foil" means a foil having no lift components piercing the surface of the water in the foilborne mode.*

1.4.24 *"High speed craft" is a craft capable of maximum speed equal to or exceeding:*

$$3.7\,\nabla^{0.1667} \quad \text{(m/s)}$$

where:

∇ = *displacement corresponding to the design waterline (m3).*

1.4.25 *"Hydrofoil boat" is a craft which is supported above the water surface in non-displacement mode by hydrodynamic forces generated on foils.*

1.4.26 *"Length (L)" means the overall length of the underwater watertight envelope of the rigid hull, excluding appendages, at or below the design waterline in the displacement mode with no lift or propulsion machinery active.*

1.4.27 *"Lightweight" is the displacement of the craft in tonnes without cargo, fuel, lubricating oil, ballast water, fresh water and feedwater in tanks, consumable stores, passengers and crew and their effects.*

1.4.28 *"Machinery spaces" are spaces containing internal combustion engines with aggregate total power output of more than 110 kW, generators, oil fuel units, propulsion machinery, major electrical machinery and similar spaces and trunks to such spaces.*

1.4.29 *"Maximum operational weight" means the overall weight up to which operation in the intended mode is permitted by the Administration.*

1.4.30 *"Maximum speed" is the speed achieved at the maximum continuous propulsion power for which the craft is certified at maximum operational weight and in smooth water.*

1.4.31 *"Muster station" is an area where passengers can be gathered in the event of an emergency, given instructions and prepared to abandon the craft, if necessary. The passenger spaces may serve as muster stations if all passengers can be instructed there and prepared to abandon the craft.*

1.4.32 *"Non-displacement mode" means the normal operational regime of a craft when non-hydrostatic forces substantially or predominantly support the weight of the craft.*

1.4.33 *"Oil fuel unit" is the equipment used for the preparation of oil fuel for delivery to an oil-fired boiler, or equipment used for the preparation for delivery of heated oil to an internal combustion engine, and includes any oil pressure pumps, filters and heaters dealing with oil at a pressure of more than 0.18 N/mm^2.*

1.4.34 *"Open vehicle spaces" are spaces:*

.1 *to which any passengers carried have access;*

.2 *intended for carriage of motor vehicles with fuel in their tanks for their own propulsion; and*

.3 *either open at both ends, or open at one end and provided with adequate natural ventilation effective over their entire length through permanent openings in the side plating or deckhead or from above.*

1.4.35 *"Operating compartment" means the enclosed area from which the navigation and control of the craft is exorcized.*

1.4.36 *"Operating station " means a confined area of the operating compartment equipped with necessary means for navigation, manoeuvring and communication, and from where the functions of navigating, manoeuvring, communication, commanding, conning and lockout are carried out.*

1.4.37 *"Operational speed" is 90% of the maximum speed.*

1.4.38 *"Organization" means the International Maritime Organization.*

1.4.39 *"Passenger" is every person other than:*

.1 *the master and members of the crew or other persons employed or engaged in any capacity on board a craft on the business of that craft; and*

.2 *a child under one year of age.*

1.4.40 *"Passenger craft" is a craft which carries more than twelve passengers.*

1.4.41 *"Place of refuge" is any naturally or artificially sheltered area which may be used as a shelter by a craft under conditions likely to endanger its safety.*

1.4.42 *"Public spaces" are those spaces allocated for the passengers and include bars, kiosks, smoke rooms, main seating areas, lounges, dining rooms, recreation rooms, lobbies, lavatories and similar permanently enclosed spaces allocated for passengers.*

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.4.43 *"Service spaces" are those enclosed spaces used for pantries containing food warming equipment but no cooking facilities with exposed heating surfaces, lockers, sales shops, store-rooms and enclosed baggage rooms.*

1.4.44 *"Significant wave height" is the average height of the one third highest observed wave heights over a given period.*

1.4.45 *"Special category spaces" are those enclosed spaces intended for the carriage of motor vehicles with fuel in their tanks for their own propulsion, into and from which such vehicles can be driven and to which passengers have access, including spaces intended for the carriage of cargo vehicles.*

1.4.46 *Surface effect ship" (SES) is an air-cushion vehicle whose cushion is totally or partially retained by permanently immersed hard structures.*

1.4.47 *"Transitional mode" means the regime between displacement and non-displacement modes.*

1.4.48 *"Worst intended conditions" means the specified environmental conditions within which the intentional operation of the craft is provided for in the certification of the craft. This should take into account parameters such as the worst conditions of wind force allowable, significant wave height (including unfavourable combinations of length and direction of waves), minimum air temperature, visibility and depth of water for safe operation and such other parameters as the Administration may require in considering the type of craft in the area of operation.*

1.5 Surveys

1.5.1 *Each craft should be subject to the surveys specified below:*

.1 *an initial survey before the craft is put in service or before the certificate is issued for the first time;*

.2 *a renewal survey at intervals specified by the Administration but not exceeding 5 years except where 1.8.5 or 1.8.10 is applicable;*

.3 *a periodical survey within three months before or after each anniversary date of the certificate; and*

.4 *an additional survey as the occasion arises.*

1.5.2 *The surveys referred to in 1.5.1 should be carried out as follows:*

.1 *the initial survey should include:*

.1.1 *an appraisal of the assumptions made and limitations proposed in relation to loadings, environment, speed and manoeuvrability;*

.1.2 *an appraisal of the data supporting the safety of the design obtained as appropriate from calculations, tests and trials;*

.1.3 *a failure mode and effect analysis as required by this Code;*

.1.4 *an investigation into the adequacy of the various manuals to be supplied to the craft; and*

.1.5 *a complete inspection of the structure, safety equipment, radio installations and other equipment. fittings, arrangements and materials to ensure that they comply with the requirements of the Code, are in satisfactory condition and are fit for the service for which the craft is intended;*

.2 *the renewal and periodical surveys should include a complete inspection of the structure, including the outside of the craft's bottom and related items, safety equipment, radio installations and other equipment as referred to in 1.5.2.1 to ensure that they comply with the requirements of the Code, are in satisfactory condition and are fit for the service for which the craft is intended. The inspection of the craft's bottom should be conducted with the craft out of the water under suitable conditions for close-up examination of any damaged or problem areas; and*

.3 *an additional survey, either general or partial according to the circumstances, should be made after a repair resulting from investigations prescribed in 1.7.3, or wherever any important repairs or renewals are made. The survey should be such as to ensure that the necessary repairs or renewals have been effectively made, that the material and workmanship of such repairs or renewals are in all respects satisfactory, and that the craft complies in all respects with the requirements of the Code.*

1.5.3 *The periodical surveys referred to in 1.5.1.3 should be endorsed on the High Speed Craft Safety Certificate.*

1.5.4 *The inspection and survey of the craft, so far as regards the enforcement of the provisions of the Code, should be carried out by officers of the Administration. The Administration may, however, entrust the inspections and surveys either to surveyors nominated for the purpose or to organizations recognized by it.*

1.5.5 *An Administration nominating surveyors or recognizing organizations to conduct inspections and surveys as set forth in 1.5.4 should, as a minimum, empower any nominated surveyor or recognized organization to:*

.1 *require repairs to a craft; and*

.2 *carry out inspections and surveys if requested by the appropriate authorities of a port State.*

The Administration should notify the Organization of the specific responsibilities and conditions of the authority delegated to nominated surveyors or recognized organizations.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.5.6 *When a nominated surveyor or recognized organization determines that the condition of the craft or its equipment does not correspond substantially with the particulars of the certificate or is such that the craft is not fit to operate without danger to the craft or persons on board, such surveyor or organization should immediately ensure that corrective action is taken and should, in due course, notify the Administration. If such corrective action is not taken the certificate should be withdrawn and the Administration should be notified immediately; and, if the craft is in an area under the jurisdiction of another Government, the appropriate authorities of the port State should be notified immediately. When an officer of the Administration, a nominated surveyor or recognized organization has notified the appropriate authorities of the port State, the Government of the port State concerned should give such officer, surveyor or organization any necessary assistance to carry out their obligations under this section. When applicable, the Government of the port State concerned should ensure that the craft should not continue to operate until it can do so without danger to the craft or the persons on board.*

1.5.7 *In every case, the Administration should fully guarantee the completeness and efficiency of the inspection and survey, and should undertake to ensure the necessary arrangements to satisfy this obligation.*

1.6 Approvals

The owner of a craft should accept the obligation to supply sufficient information to enable the Administration to fully assess the features of the design. It is strongly recommended that the owner and Administration and, where appropriate, the port State or States, commence discussions at the earliest possible stage so that the Administration may fully evaluate the design in determining what additional or alternative requirements should be applied to the craft to achieve the required level of safety.

1.7 Maintenance of conditions after survey

1.7.1 *The condition of the craft and its equipment should be maintained to conform with the provisions of this Code to ensure that the craft in all respects will remain fit to operate without danger to the craft or the persons on board.*

1.7.2 *After any survey of the craft under 1.5 has been completed, no change should be made to structure, equipment, fittings, arrangements and materials covered by the survey, without the sanction of the Administration.*

1.7.3 *Whenever an accident occurs to a craft or a defect is discovered, either of which affects the safety of the craft or the efficiency or completeness of structure, equipment, fittings, arrangements and materials, the person in charge or owner of the craft should report at the earliest opportunity to the Administration, the nominated surveyor or recognized organization responsible, who should cause investigations to be initiated to determine whether a survey, as required by 1.5, is necessary. If the craft is in an area under the jurisdiction of another Government, the person in charge or the owner should also report immediately to the appropriate authorities of the port State and the nominated surveyor or recognized organization should ascertain that such a report has been made.*

1.8 High Speed Craft Safety Certificate

1.8.1 *A certificate called a High Speed Craft Safety Certificate is issued after completion of an initial or renewal survey to a craft which complies with the requirements of the Code. The certificate should be issued or endorsed either by the Administration or by any person or organization recognized by it. In every case, that Administration assumes full responsibility for the certificate.*

1.8.2 *A Contracting Government to the Convention may, at the request of the Administration, cause a craft to be surveyed and, if satisfied that the requirements of the Code are complied with, should issue or authorize the issue of a certificate to the craft and, where appropriate, endorse or authorize the endorsement of a certificate on the craft in accordance with the Code. Any certificate so issued should contain a statement to the effect that it has been issued at the request of the Government of the State the flag of which the craft is entitled to fly, and it should have the same force and receive the same recognition as a certificate issued under 1.8.1.*

1.8.3 *The certificate should be that of the model given in annex 1 to the Code. If the language used is neither English nor French, the text should include a translation into one of these languages.*

Guidance note:
Annex 1 of the HSC Code is not included in the HSLC Rules.

---e-n-d---of---G-u-i-d-a-n-c-e---n-o-t-e---

1.8.4 *The High Speed Craft Safety Certificate should be issued for a period specified by the Administration which should not exceed five years.*

1.8.5 *Notwithstanding the requirements of 1.8.4, when the renewal survey is completed within three months before the expiry date of the existing certificate, the new certificate should be valid from the date of completion of the renewal survey to a date not exceeding five years from the date of expiry of the existing certificate.*

1.8.6 *When the renewal survey is completed after the expiry date of the existing certificate, the new certificate should be valid from the date of completion of the renewal survey to a date not exceeding five years from the date of expiry of the existing certificate.*

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.8.7 *When the renewal survey is completed more than three months before the expiry date of the existing certificate, the new certificate should be valid from the date of completion of the renewal survey to a date not exceeding five years from the date of completion of the renewal survey.*

1.8.8 *If a certificate is issued for a period of less than five years, the Administration may extend the validity of the certificate beyond the expiry date to the maximum period specified in 1.8.4, provided that the surveys when a certificate is issued for a period of five years are carried out.*

1.8.9 *If a renewal survey has been completed and a new certificate cannot be issued or placed on board the craft before the expiry date of the existing certificate, the person or organization authorized by the Administration may endorse the existing certificate and such a certificate should be accepted as valid for a further period which should not exceed 5 months from the expiry date.*

1.8.10 *If a craft at the time when a certificate expires is not in the place in which it is to be surveyed, the Administration may extend the period of validity of the certificate but this extension should be granted only for the purpose of allowing the craft to proceed to the place in which it is to be surveyed, and then only in cases where it appears proper and reasonable to do so. No certificate should be extended for a period longer than one month, and a craft to which an extension is granted should not, on its arrival in the place in which it is to be surveyed, be entitled by virtue of such extension to leave that place without having a new certificate. When the renewal survey is completed, the new certificate should be valid to a date not exceeding five years from the date of expiry of the existing certificate before the extension was granted.*

1.8.11 *In special circumstances, as determined by the Administration, a new certificate need not be dated from the date of expiry of the existing certificate as required by 1.8.6 or 1.8.10. In these circumstances, the new certificate should be valid to a date not exceeding five years from the date of completion of the renewal survey.*

1.8.12 *If a periodical survey is completed before the period specified in 1.5, then:*

.1 *the anniversary date shown on the relevant certificate should be amended by endorsement to a date which should not be more than three months later than the date on which the survey was completed;*

.2 *the subsequent periodical survey required by 1.5 should be completed at the intervals prescribed by 1.5 using the new anniversary date; and*

.3 *the expiry date may remain unchanged provided one or more periodical surveys are carried out so that the maximum intervals between the surveys prescribed by 1.5.1.3 are not exceeded.*

1.8.13 *A certificate issued under 1.8.1 or 1.8.2 should cease to be valid in any of the following cases:*

.1 *if the relevant surveys are not completed within the periods specified in 7.5.1;*

.2 *if the certificate is not endorsed in accordance with 1.5.3; or*

.3 *upon transfer of the craft to the flag of another State. A new certificate should only be issued when the Government issuing the new certificate is fully satisfied that the craft is in compliance with the requirements of 1.7.1 and 1.7.2. In the case of a transfer between Governments that are Contracting Governments to the Convention, if requested within three months after the transfer has taken place, the Government of the State whose flag the craft was formerly entitled to fly should, as soon as possible, transmit to the Administration a copy of the certificate carried by the craft before the transfer and, if available, copies of the relevant survey reports.*

1.8.14 *The privileges of the Code may not be claimed in favour of any craft unless it holds a valid certificate.*

1.9 Permit to Operate High Speed Craft

1.9.1 *The craft should not operate commercially unless a Permit to Operate High Speed Craft is issued and valid in addition to the High Speed Craft Safety Certificate. Transit voyage without passengers or cargo may be undertaken without the Permit to Operate High Speed Craft.*

1.9.2 *The Permit to Operate High Speed Craft should be issued by the Administration to certify compliance with 1.2.2 to 1.2.7 and stipulate conditions of the operation of the craft and drawn up on the basis of the information contained in the route operational manual specified in chapter 18 of this Code.*

Guidance note:

Chapter 18 covers operational requirements, which is currently not included in the HSLC rules.

---e-n-d---of---G-u-i-d-a-n-c-e---n-o-t-e---

1.9.3 *Before issuing the Permit to Operate, the Administration should consult with each port State to obtain details of any operational conditions associated with operation of the craft in that State. Any such conditions imposed should be shown by the Administration on the Permit to Operate and included in the route operational manual.*

1.9.4 *A port State may inspect the craft and audit its documentation for the sole purpose of verifying its compliance with the matters certified by and conditions associated with the Permit to Operate. Where deficiencies are shown by such an audit, the Permit to Operate ceases to be valid until such deficiencies are corrected or otherwise resolved.*

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.9.5 *The provisions of 1.8 should apply to the issue and the period of validity of the Permit to Operate High Speed Craft.*

1.9.6 *The Permit to Operate High Speed Craft should be that of the model given in annex 2 to this Code. If the language used is neither English nor French, the text should include a translation into one of these languages.*

Guidance note:
Annex 2 of the HSC Code is not included in the HSLC rules.

---e-n-d---of---G-u-i-d-a-n-c-e---n-o-t-e---

1.10 Control

The provisions of regulation I/19 of the Convention should be applied to include the Permit to Operate High Speed Craft in addition to the certificate issued under 1.8.

1.11 Equivalents

1.11.1 *Where this Code requires that a particular fitting, material, appliance or apparatus, or type thereof, should be fitted or carried in a craft, or that any particular provision should be made, the Administration may allow any other fitting, material, appliance or apparatus, or type thereof, to be fitted or carried, or any other provision to be made in that craft, if it is satisfied by trial thereof or otherwise that such fitting, material, appliance or apparatus, or type thereof, or provision, is at least as effective as that required by this Code.*

1.11.2 *Where compliance with any of the requirements of this Code would be impractical for the particular designs of the craft, the Administration may substitute those with alternative requirements provided that equivalent safety is achieved. The Administration which allows any such substitution should communicate to the Organization particulars of these substitutions and the reasons therefor, which the Organization should circulate to its Member Governments for their information.*

1.12 Information to be made available

1.12.1 *The Administration should ensure that the management of the company operating the craft has provided the craft with adequate information and guidance in the form of manuals to enable the craft to be operated and maintained safely. These manuals should include a route operational manual, craft operating manual, maintenance manual and servicing schedule. Such information should be updated as necessary.*

1.12.2 *The manuals should contain at least the information specified in chapter 18 and should be in a language understood by the crew. Where this language is not English, a translation into English should be provided of at least the route operational manual and the craft operating manual.*

Guidance note:
Chapter 18 covers operational requirements, which is currently not included in the HSLC rules.

---e-n-d---of---G-u-i-d-a-n-c-e---n-o-t-e---

1.13 Further developments

1.13.1 *It is recognized that there is much ongoing research and development in the design of high speed craft and that new types may emerge which have different geometry to that envisaged during the formulation of this Code. It is important that this Code does not restrict this progress and the development of new designs.*

1.13.2 *A design may be produced which cannot comply with the provisions of this Code. In such a case the Administration should determine the extent to which the provisions of the Code are applicable to the design and, if necessary, develop additional or alternative requirements to provide an equivalent level of safety for the craft.*

1.13.3 *The foregoing should be considered by the Administration when assessing the granting of equivalents under the Code.*

1.14 Circulation of safety information

1.14.1 *In the event that an Administration has cause to investigate an accident involving a craft to which this Code applies, that Administration should provide a copy of the official report to the Organization, which will invite Member States to note the existence of the report and to obtain a copy.*

1.14.2 *In the event that operational experience reveals structural or equipment failures affecting the safety of a design, craft owners should inform the Administration.*

1.15 Review of the Code

1.15.1 *The Code should be reviewed by the Organization at intervals preferably not exceeding four years to consider revision of existing requirements to take account of new developments in design and technology.*

1.15.2 *Where a new development in design and technology has been found acceptable to an Administration, that Administration may submit particulars of such development to the Organization for consideration for incorporation into the Code during periodical review.*

SECTION 3
FLAG ADMINISTRATION REQUIREMENTS

A. General

A 100 IMO HSC Code - General

101 The IMO HSC Code has a number of requirements which are left to the Flag State Administration to decide upon with respect to the specific interpretation of the requirement. The Code text often uses the expression that the requirement should be "to the satisfaction of the Administration".

102 The goal for international regulations is to have as uniform requirements as possible. Most requirements which contain the expression "to the satisfaction of the Administration" have been removed from IMO documents as far as practicable.

103 Those requirements which are dependant on local or domestic conditions are still up to the Administration to decide.

104 DNV aims at a uniform set of requirements both to be as transparent as possible and also to be specific in contractual and statutory matters. Consequently, a number of the "up to the Administration" requirements of the HSC Code has been interpreted by DNV.

105 The cross references between the HSC Code and the DNV rules refer to all requirements in the HSC Code where the Flag or Port State is mentioned in connection with a requirement.

106 The HSC Code paragraphs left to the Administration to decide, and the corresponding DNV paragraph with comments are given in the following. HSC Code paragraphs are given by x.x.x and DNV paragraphs by Pt.y Ch.y Sec.y.

A 200 HSC Code chapter 1

201

1.2.12 concerning evacuation procedures required for crew sleeping berths, see Sec.1 C300 for information. Specific requirements are to be developed in each case.

1.4.10.1 concerning criteria for maximum rescue time for category A craft, see Sec.1 C300 for information. This is an operational condition and has to be agreed between Flag and Port State(s) of the route in question.

1.4.29 concerning maximum operational weight in the intended mode, see Sec.1 C300 for information. Unless otherwise defined, this definition should correspond to the maximum displacement as defined in Pt.3 Ch. 1 Sec. 1 D101.

1.4.48 concerning parameters for worst intended condition, see Sec.1 C300 for information. Unless otherwise defined, this definition should correspond to the restrictions given by design accelerations in Pt.3 Ch.1 Sec.2 B200, and given in the appendix to the class certificate, see Pt.3 Ch.1 Sec.2 A105.

1.5.1.2 concerning renewal survey intervals, see Sec.1 C300 for information. Pt.7 Ch.2 Sec.1 A100 specify 5 years for main class notation **1A1 HSLC** and 3 years for **1A2 HSLC** See also Pt.1 Ch.1 Sec.2 B302 for the notation **1A2 HSLC**.

1.5.4 concerning recognised organisations, see Sec.1 C300 for information. DNV is a recognised classification society.

1.5.5 concerning recognised organisation, see 1.5.4.

1.5.6 concerning recognised organisation, see 1.5.4.

1.5.7 concerning Administrations' responsibility for completeness of inspections and surveys carried out by recognised organisations, see 1.5.4 and Pt.1 Ch.1 Sec.1 B602 with respect to information to the Flag Administration of the craft.

1.6 concerning approvals, see 1.5.4 to 1.5.7 above, and Pt.1 Ch.1 Sec. 3 A500 for plan approval.

1.7.2 concerning changes after initial survey, see Sec.1 C300 for information and Pt.1 Ch.1 Sec.3 B for retention of class.

1.8.1 concerning issue of High Speed Craft Safety Certificate, see Sec.1 C300 for information. This certificate is issued when DNV acts on behalf of a Flag Administration on basis of delegated authority.

1.8.11 concerning circumstances for issue of certificate, see Sec.1 C300 for information and Pt.1 Ch.1 Sec.3 B800 for issuance and validity of certificates.

1.11.1 concerning acceptance of equivalents, see Sec.1 C300 for information and Pt.1 Ch.1 Sec.1 B306 and B307 with respect to equivalent alternatives.

1.11.2 concerning alternative requirements, see 1.11.1. The Society does not have the possibility of applying

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

alternative requirements which are not found to be equivalent, unless such alternative requirements are accepted by Flag State for own domestic service or reported by Flag State to IMO for craft intended for international service.

1.12.1 concerning sufficient manuals, see Sec.1 C300 for information. HSC Code chapter 18 is not included in the Rules for HSLC. This chapter covers the Permit to Operate «certificate», which is not covered by the class certificate.

1.13.2 concerning provisions for craft outside the Code, see Sec.1 C300 for information. This paragraph of the HSC Code is in conflict with paragraph 1.2.1 of the same Code, and equivalent solutions should be established. See comment under 1.11.1.

1.13.3 concerning equivalents for craft outside the Code, see 1.13.2.

1.14.2 concerning craft owner's obligation to inform the administration, see Sec.1 C300 for information, and Pt.1 Ch.1 Sec.3 B101 with respect to the owners duty to inform the class.

A 300 HSC Code chapter 2

301

2.3.4 concerning equivalent intact stability, see Pt.3 Ch.6 Sec.1 B501. Equivalent requirements are to be established in each case.

2.6.4 concerning the use of low-density foam for buoyancy, see Pt.5 Ch.1 Sec.3 B404 (without interpretation).

2.7.2 concerning addition and amendments to stability information, see Pt.3 Ch.6 Sec.1 A405 (without interpretation).

2.8 concerning electronic loading and stability calculation, see Pt.3 Ch.6 Sec.1 A501. Loading computers are subject to approval on basis of Rules for Classification of Ships.

2.16 concerning lightweight survey instead of inclining test, see Pt.3 Ch.6 Sec.1 A400, Guidance note with interpretation.

3.5 concerning design criteria, Ch.4 Sec.4 A200 gives information. Criteria are established by Pt.3 and Pt.4.

3.6 concerning full scale trials, see Ch.4 Sec.4 A200 for information. Requirements for functional and structural testing are given in Pt.1 Ch.1 Sec.3 A700.

A 400 HSC Code chapter 4

401

4.8.2 concerning evacuation procedure, see Pt.3 Ch.7 Sec.1 C202 (without interpretation).

4.8.3 concerning verification of evacuation time, see Pt.3 Ch.7 Sec.1 C203 (without interpretation).

4.8.6 concerning partial evacuation demonstration, see Pt.3 Ch.7 Sec.1 C206 (without interpretation).

A 500 HSC Code chapter 5

501

5.2.3 concerning manual secondary means of control, see Pt.4 Ch.14 (without interpretation).

5.2.4 concerning time to establish secondary control, see Pt.4 Ch.13 Sec.3 A202 (without interpretation). Backup on electrical system from auxiliary and emergency diesel generators is covered by separate requirements in Pt.4 Ch.8, with interpretation of HSC Code 12.3.6.

A 600 HSC Code chapter 7

601

7.2.4 concerning criteria for non-combustible material, see Pt.4 Ch.10 Sec.1 C401. The IMO Res. A.472(XII) applies.

7.5.6.2 concerning discharge of fuel with flash point below 43 °C, see Pt.4 Ch.6 Sec.5 A501 (without interpretation).

Guidance note:
The following text under HSC Code chapter 7 is taken from SOLAS and will be amended by IMO.

---e-n-d---of---G-u-i-d-a-n-c-e---n-o-t-e---

7.7.2.1.8 concerning maximum number of enclosed spaces with fire detection, see Pt.4 Ch.10 Sec.5 A201 (without interpretation).

7.7.2.1.9 concerning fire detection of spaces without remote identification, see Pt.4 Ch.10 Sec.5 A201 (without interpretation).

7.7.2.1.11 concerning alternative fire detectors, see Pt.4 Ch.10 Sec.5 A201 (without interpretation).

7.7.2.2.5 concerning alternative spacing of fire detectors, see Pt.4 Ch.10 Sec.5 A202 (without interpretation).

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

7.7.2.3.2 concerning alternative sensitivity of smoke-detectors, see Pt.4 Ch.10 Sec.5 A203 (without interpretation).

7.7.2.3.4 concerning increased setting of heat detectors, see Pt.4 Ch.10 Sec.5 A203 (without interpretation).

7.7.6.1.1 concerning use of fire extinguishing medium, see Pt.4 Ch.10 Sec.6 A201 (without interpretation).

7.7.6.1.5 concerning additional fire fighting medium where added air, see Pt.4 Ch.10 Sec.6 A201 (without interpretation)

7.7.6.1.12 concerning pressure vessels on fire fighting systems, see Pt.4 Ch.10 Sec.6 A201. The pressure vessel is to be certified by the Society.

7.7.8.5 concerning maximum length of fire hoses, see Pt.4 Ch.10 Sec.7 A101 (without interpretation).

7.10.1.3 concerning additional personal breathing apparatus, see Pt.4 Ch.10 Sec.8 C104 (without interpretation).

7.10.3.2.1 concerning self-contained breathing apparatus, see Pt.4 Ch.10 Sec.8 C201, with interpretation in Guidance note.

A 700 HSC Code chapter 8

701

8.1.2 concerning approval of lifesaving appliances, see Pt.3 Ch.8 Sec.1 B102 (without interpretation).

8.1.3 concerning approval of life-saving appliances, see 8.1.2. The IMO res. A.689(17) applies.

8.1.4 concerning approval of novel life-saving appliances, see 8.1.2. The IMO res. A.520(13) applies.

8.1.5 concerning acceptance of life-saving appliances, see 8.1.2.

8.1.6 concerning requirements outside Ch. III of the Convention, see 8.1.2.

8.1.7 concerning production tests, see 8.1.2.

8.1.8 concerning approval conditions, see 8.1.2.

8.1.9 concerning period of acceptability, see 8.1.2.

8.3.8 concerning relaxed requirement for suits in warm climates, see Pt.3 Ch.8 Sec.1 C308 (without interpretation).

8.6.1 concerning adjustable bowsing lines, see Pt.3 Ch.8 Sec.1 E101 (without interpretation).

8.7.5 concerning acceptance of direct boarding into survival craft, see Pt.3 Ch.8 Sec.1 E305. The rules apply 1,5 m as maximum without interpretation by Flag Administration.

8.9.2.2 concerning special shipboard maintenance program, see Pt.3 Ch.8 Sec.1 F202 (without interpretation).

8.10.1.6.2 concerning rescue boat for pair of liferafts, see Pt.3 Ch.8 Sec.1 E401 (without interpretation).

8.10.2 concerning the use of open reversible liferafts, see Pt.3 Ch.8 Sec.1 E402 (without interpretation).

A 800 HSC Code chapter 9

801

9.1.9 concerning equivalent safety level for machinery, see Pt.4 Ch.1 Sec.1 A210 (without interpretation).

9.1.12 concerning alternative design angles for machinery, see Pt.4 Ch.1 Sec.1 A213 (without interpretation).

A 900 HSC Code chapter 10

901

10.2.4.7.2 concerning permit to use oil level gauge of glass on cargo ships has been omitted from the rules as the arrangement is not relevant for high speed craft.

10.3.7 concerning internal diameter of bilge, see Pt.4 Ch.6 Sec. 4 A107 (without interpretation).

A 1000 HSC Code chapter 11

1001

12.2.9 concerning equivalent main bus-bar arrangement, see Pt.4 Ch.8 (without interpretation).

12.6.1.2 concerning additional requirements for portable electrical equipment, see Pt.4 Ch.8 (without interpretation).

12.6.2 concerning maximum voltage on switchboard front, see Pt.4 Ch.8 (without interpretation).

12.6.3 concerning automatic continuous checking of insulation level, see Pt.4 Ch.8, which exceeds the requirements of the Code text. Manual checking is not accepted.

12.6.4.1 concerning non-continuous metal sheets and armour, see Pt.4 Ch.8 which exceeds the requirements of the Code text. Exceptions not accepted.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

12.6.4.2 concerning use of non-flame-retardant cables, see Pt.4 Ch.8, which exceeds the requirements of the Code text.

12.6.4.4 concerning cables in hazardous areas, see Pt.4 Ch.8, which exceeds the requirements of the Code text.

12.6.5.1 concerning use of non-protected circuits, see Pt.4 Ch.8, which exceeds the requirements of the Code text.

12.6.9 concerning use of electrical equipment in spaces with flammable mixtures, see Pt.4 Ch.8, which exceeds the requirements of the Code text.

12.6.10 concerning use of higher voltage for propulsion purposes is not covered by any DNV rule text. This is to be specially considered in each individual case.

12.7.4.4.1 concerning reduced emergency power for navigational equipment, see Pt.5 Ch.1 Sec.5 A203 (without interpretation).

12.7.9.1 concerning alternative emergency lightening, see Pt.5 Ch.1 Sec.5 A208 (without interpretation).

12.8.2.2.4.1 concerning reduced emergency power for navigational equipment, see Pt.5 Ch.3 Sec.4 D202 (without interpretation).

A 1100 HSC Code chapter 13

1101

13.1.1. concerning equivalent navigational equipment, see Pt.4 Ch.11 Sec.2 A101 with interpretation in 102 and 103.

13.1.2 concerning satisfactory navigational equipment, see Pt.4 Ch.11 Sec.2 A104 (without interpretation).

A 1200 HSC Code chapter 14

1201

14.3.1 concerning exemptions from radio equipment, see Pt.4 Ch.12 Sec.1 A500 (without interpretation).

14.3.3 concerning exemptions to be reported, see 14.3.1.

14.6.4 concerning exemptions after 970201, see 14.3.1.

14.8.4 concerning exemptions before 970201, see 14.3.1.

14.9.4 concerning exemptions before 970201, see 14.3.1.

14.10.2 concerning exemptions before 970201, see 14.3.1.

14.14.5 concerning maintenance of radio equipment, see Pt.4 Ch.12 Sec.2 C905, (without interpretation).

14.14.6 concerning radio equipment for restricted service, see 14.3.1.

14.14.7. see 14.3.1.

14.14.8. see 14.3.1.

14.15 concerning qualification of radio personnel, see Pt.4 Ch.12 Sec.1 C101 (without interpretation).

A 1300 HSC Code chapter 15

1301

15.3.1 concerning layout of navigation workstation, see Pt.4 Ch.11 Sec. 3 A201 (without interpretation).

15.3.4 concerning astern field of vision, see Pt.4 Ch.11 Sec.3 A204 (without interpretation).

15.4.10 concerning the use of safety belts for operating crew, see Pt.4 Ch.11 Sec. 3 A312 (without interpretation).

15.5.8. concerning suitable table for chart, see Pt.4 Ch.11 Sec. 3 A408 (should be a part of integrated work-station).

15.7.2. concerning clear view from the bridge, see Pt.4 Ch.11 Sec. 3 A602. Wipers, water spray and de-icing may be required.

A 1400 HSC Code chapter 17

1401

17.5.4.1 concerning safety in respect of handling, controllability and performance, see Pt.4 Ch.11 Sec.1 B200 and Pt.4 Ch.11 Sec.4 A400, with interpretation in Pt.5 Ch.1 Sec.1 B201.

17.8 concerning the worst likely acceleration or deceleration, see Pt.4 Ch.11 Sec.4 A700, with interpretation in Pt.3 Ch.1 Sec.2 B and Pt.5 Ch.1 Sec.2 B300.

A 1500 HSC Code chapter 18

1501

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Chapter 18 of the HSC Code concerning:

— maintenance manual to be carried onboard
— permit to operate
— operational training for crew
— practical test over the relevant route
— procedure for re-validation of type rating certificate
— crew standard of physical fitness
— training, experience and qualification of the master and crew
— person in charge of liferaft

is not included in the rules. However, regarding 18.1.4 concerning maximum allowable distance from a base port or place of refuge, see Pt.1 Ch.1 Sec.2 B400, with interpretations in 402 and 404.

A 1600 HSC Code chapter 19

1601

19.1 concerning operator's organisation. This is not included in the rules.

19.2 concerning maintenance of craft and equipment, see Pt.1 Ch.1 Sec.3 B (with interpretation).

19.3 concerning maintenance of all life-saving appliances, see Pt.3 Ch.8 Sec.1 F (without interpretation).

Lloyd's Register is an exempt charity under the UK Charities Act 1993

Lloyd's Register, its affiliates and subsidiaries and their respective officers, employees or agents are, individually and collectively, referred to in this clause as the 'Lloyd's Register Group'. The Lloyd's Register Group assumes no responsibility and shall not be liable to any person for any loss, damage or expense caused by reliance on the information or advice in this document or howsoever provided, unless that person has signed a contract with the relevant Lloyd's Register Group entity for the provision of this information or advice and in that case any responsibility or liability is exclusively on the terms and conditions set out in that contract.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

General Information

1. The 2011 edition of the Rules and Regulations for the Classification of Special Service Craft is a complete reprint of the 2010 edition, consisting of 8 books.

Volume 1, Part 1	Regulations
Rules for the Manufacture, Testing and Certification of Materials	
Volume 3, Part 3	General Requirements and Constructional Arrangement
Volume 3, Part 4	Additional Requirements for Yachts
Volume 3, Part 5	Design and Load Criteria
Volume 4, Part 6	Hull Construction in Steel
Volume 5, Part 7	Hull Construction in Aluminium
Volume 6, Part 8	Hull Construction in Composite
Volume 7, Part 9	General Requirements for Machinery
Volume 7, Part 10	Prime Movers
Volume 7, Part 11	Transmission Systems
Volume 7, Part 12	Propulsion Devices
Volume 7, Part 13	Shaft Vibration and Alignment
Volume 7, Part 14	Steering Systems
Volume 7, Part 15	Piping Systems and Pressure Plant
Volume 7, Part 16	Control and Electrical Engineering
Volume 8, Part 17	Fire Protection, Detection and Extinction

2. A decimal notation system has been adopted throughout. Five sets of digits cover the divisions, i.e. Part, Chapter, Section, sub-Section and paragraph. The textual cross-referencing within the text is as follows, although the right-hand digits may be added or omitted depending on the degree of precision required:
   (a) In same Chapter, e.g. *see* 2.1.3 (i.e. down to paragraph).
   (b) In same Part but different Chapter, e.g. *see* Ch 3,2.1 (i.e. down to sub-Section).
   (c) In another Part, e.g. *see* Pt 5, Ch 1,3 (i.e. down to Section).

   The cross-referencing for Figures and Tables is as follows:
   (a) In same Chapter, e.g. as shown in Fig. 2.3.5 (i.e. Chapter, Section and Figure Number).
   (b) In same Part but different Chapter, e.g. as shown in Fig. 2.3.5 in Chapter 2.
   (c) In another Part, e.g. *see* Table 2.7.1 in Pt 3, Ch 2.

3. The primary changes from the 2010 edition of the Rules are identified in the Guide Book. The effective dates of the indicated changes are 1 January 2011, 1 February 2011 & 1 July 2011.

4. Until the next edition of the Rules and Regulations for the Classification of Special Service Craft is published, Rule change Notices and/or Corrigenda, as necessary, will be published on the LR Webstore — www.webstore.lr.org/ – and will be available for downloading free of charge. It is not intended at this time to publish hard copies of future Rule Notices to Existing Rules.

5. In this publication, a shortened version of the Notice has been reproduced listing all the paragraphs that have been altered since the last edition of the Rules. It is followed by a comprehensive Contents list of all books in the set, showing all the titles down to Section level.

Contents

VOLUME 1, PART 1

PART 1 REGULATIONS

CHAPTER 1 GENERAL REGULATIONS
Sections 1 to 8

CHAPTER 2 CLASSIFICATION REGULATIONS
Section 1 Conditions for classification
Section 2 Scope of the Rules
Section 3 Character of classification and class notations
Section 4 Surveys – General
Section 5 IACS QSCS Audits
Section 6 Type Approval/ Type testing/ Quality control system
Section 7 Classification of machinery for crafts/yachts with [⊠] LMC or MCH notation

CHAPTER 3 PERIODICAL SURVEY REGULATIONS FOR SERVICE CRAFT
Section 1 General
Section 2 Annual Surveys – Hull and machinery requirements
Section 3 Intermediate Surveys – Hull and machinery requirements
Section 4 Docking Surveys and In-water Surveys – Hull and machinery requirements
Section 5 Special Survey – General – Hull requirements
Section 6 Special Survey – Thickness measurement requirements for steel craft
Section 7 Machinery surveys – General requirements
Section 8 Gas turbines – Detailed requirements
Section 9 Oil engines – Detailed requirements
Section 10 Electrical equipment
Section 11 Screwshafts, tube shafts, propellers and water jet units
Section 12 Classification of craft not built under survey

CHAPTER 4 PERIODICAL SURVEY REGULATIONS FOR YACHTS
Section 1 General
Section 2 Intermediate Surveys – Hull and machinery requirements
Section 3 Docking Surveys and In-water Surveys – Hull and machinery requirements
Section 4 Special Survey – General – Hull requirements
Section 5 Special Survey – Thickness measurement requirements for steel yachts
Section 6 Machinery surveys – General requirements
Section 7 Gas turbines – Detailed requirements
Section 8 Oil engines – Detailed requirements
Section 9 Electrical equipment
Section 10 Screwshafts, tube shafts, propellers and water jet units
Section 11 Surveys of unclassed machinery in existing classed yachts
Section 12 Classification of yachts not built under survey

CHAPTER 5 PERIODICAL SURVEY REGULATIONS FOR AMPHIBIOUS AIR CUSHION VEHICLES (ACV)
Section 1 General
Section 2 Annual Surveys – Hull and machinery requirements
Section 3 Intermediate Surveys – Hull and machinery requirements
Section 4 Special Surveys (Hull and machinery)
Section 5 Classification of ACVs not built under survey

RULES FOR THE MANUFACTURE, TESTING AND CERTIFICATION OF MATERIALS

CHAPTER 1 GENERAL REQUIREMENTS
Section 1 Scope
Section 2 Approval and survey requirements
Section 3 Certification of materials
Section 4 General requirements for manufacture
Section 5 Non-destructive examination
Section 6 References

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Contents

CHAPTER 2 TESTING PROCEDURES FOR METALLIC MATERIALS
Section 1 General requirements for testing
Section 2 Tensile tests
Section 3 Impact tests
Section 4 Ductility tests for pipes and tubes
Section 5 Embrittlement tests
Section 6 Crack tip opening displacement tests
Section 7 Bend tests
Section 8 Corrosion tests

CHAPTER 3 ROLLED STEEL PLATES, STRIP, SECTIONS AND BARS
Section 1 General requirements
Section 2 Normal strength steels for ship and other structural applications
Section 3 Higher strength steels for ship and other structural applications
Section 4 Steels for boilers and pressure vessels
Section 5 Steels for machinery fabrications
Section 6 Ferritic steels for low temperature service
Section 7 Austenitic and duplex stainless steels
Section 8 Plates with specified through thickness properties
Section 9 Bars for welded chain cables
Section 10 High strength quenched and tempered steels for welded structures

CHAPTER 4 STEEL CASTINGS
Section 1 General requirements
Section 2 Castings for ship and other structural applications
Section 3 Castings for machinery construction
Section 4 Castings for crankshafts
Section 5 Castings for propellers
Section 6 Castings for boilers, pressure vessels and piping systems
Section 7 Ferritic steel castings for low temperature service
Section 8 Stainless steel castings
Section 9 Steel castings for container corner fittings

CHAPTER 5 STEEL FORGINGS
Section 1 General requirements
Section 2 Forgings for ship and other structural applications
Section 3 Forgings for shafting and machinery
Section 4 Forgings for crankshafts
Section 5 Forgings for gearing
Section 6 Forgings for turbines
Section 7 Forgings for boilers, pressure vessels and piping systems
Section 8 Ferritic steel forgings for low temperature service
Section 9 Austenitic stainless steel forgings

CHAPTER 6 STEEL PIPES AND TUBES
Section 1 General requirements
Section 2 Seamless pressure pipes
Section 3 Welded pressure pipes
Section 4 Ferritic steel pressure pipes for low temperature service
Section 5 Austenitic stainless steel pressure pipes
Section 6 Boiler and superheater tubes

CHAPTER 7 IRON CASTINGS
Section 1 General requirements
Section 2 Grey iron castings
Section 3 Spheroidal or nodular graphite iron castings
Section 4 Iron castings for crankshafts

CHAPTER 8 ALUMINIUM ALLOYS
Section 1 Plates, bars and sections
Section 2 Aluminium alloy rivets
Section 3 Aluminium alloy castings
Section 4 Aluminium/steel transition joints

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Contents

CHAPTER 9 COPPER ALLOYS
Section 1 Castings for propellers
Section 2 Castings for valves, liners and bushes
Section 3 Tubes

CHAPTER 10 EQUIPMENT FOR MOORING AND ANCHORING
Section 1 Anchors
Section 2 Stud link chain cables for ships
Section 3 Stud link mooring chain cables
Section 4 Studless mooring chain cables
Section 5 Short link chain cables
Section 6 Steel wire ropes
Section 7 Fibre ropes

CHAPTER 11 APPROVAL OF WELDING CONSUMABLES
Section 1 General
Section 2 Mechanical testing procedures
Section 3 Electrodes for manual and gravity welding
Section 4 Wire-flux combinations for submerged-arc automatic welding
Section 5 Wires and wire-gas combinations for manual, semi-automatic and automatic welding
Section 6 Consumables for use in electro-slag and electro-gas welding
Section 7 Consumables for use in one-side welding with temporary backing materials
Section 8 Consumables for welding austenitic and duplex stainless steels
Section 9 Consumables for welding aluminium alloys

CHAPTER 12 WELDING QUALIFICATIONS
Section 1 General qualification requirements
Section 2 Welding Procedure Qualification Tests for Steels
Section 3 Specific requirements for stainless steels
Section 4 Welding procedure tests for non-ferrous alloys
Section 5 Welder qualification tests

CHAPTER 13 REQUIREMENTS FOR WELDED CONSTRUCTION
Section 1 General welding requirements
Section 2 Specific requirements for ship hull structure and machinery
Section 3 Specific requirements for fabricated steel sections
Section 4 Specific requirements for fusion welded pressure vessels
Section 5 Specific requirements for pressure pipework
Section 6 Repair of existing ships by welding
Section 7 Austenitic and duplex stainless steels – Specific requirements
Section 8 Specific requirements for welded aluminium

CHAPTER 14 PLASTICS MATERIALS AND OTHER NON-METALLIC MATERIALS
Section 1 General requirements
Section 2 Tests on polymers, resins, reinforcements and associated materials
Section 3 Testing procedures
Section 4 Plastics pipes and fittings
Section 5 Control of material quality for composite construction

VOLUME 3, PARTS 3 TO 5

PART 3 GENERAL REQUIREMENTS AND CONSTRUCTIONAL ARRANGEMENTS

CHAPTER 1 GENERAL REGULATIONS
Section 1 Rules application
Section 2 Direct calculations
Section 3 Equivalents
Section 4 National and International Regulations
Section 5 Information required
Section 6 Definitions
Section 7 Inspection, workmanship and testing procedures
Section 8 Building tolerances and associated repairs

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Contents

CHAPTER 2 CRAFT DESIGN
Section 1 General
Section 2 Rule structural concept
Section 3 Structural idealisation
Section 4 Bulkhead arrangements
Section 5 Fore and aft end arrangements
Section 6 Machinery space arrangements
Section 7 Superstructures, deckhouses and bulwarks
Section 8 Particular requirements for multi-hulls

CHAPTER 3 CONTROL SYSTEMS
Section 1 General
Section 2 Rudders
Section 3 Sternframes and appendages
Section 4 Fixed and steering nozzles, bow and stern thrust units
Section 5 Stabiliser arrangements
Section 6 Particular requirements for multi-hull craft

CHAPTER 4 CLOSING ARRANGEMENTS AND OUTFIT
Section 1 General
Section 2 Bulkhead openings
Section 3 Double bottom openings
Section 4 Side and stern doors and other shell openings
Section 5 Hatches on exposed decks
Section 6 Miscellaneous openings
Section 7 Portlights, windows and viewing ports, skylights and glass walls
Section 8 Bulwarks, guard rails and other means for the protection of crew
Section 9 Deck drainage
Section 10 Cabin sole and lining
Section 11 Ventilators
Section 12 Air and sounding pipes
Section 13 Particular requirements for multi-hull craft

CHAPTER 5 ANCHORING AND MOORING EQUIPMENT
Section 1 General
Section 2 Equipment Number
Section 3 Service group factors
Section 4 Craft type factors
Section 5 Anchors
Section 6 Anchor cable
Section 7 Mooring ropes and towlines
Section 8 Windlass design and testing
Section 9 Structural details

CHAPTER 6 PASSENGER AND CREW ACCOMMODATION COMFORT
Section 1 General requirements
Section 2 Noise
Section 3 Vibration
Section 4 Testing
Section 5 Noise and vibration survey reporting
Section 6 Non periodical survey requirements
Section 7 Referenced standards

PART 4 ADDITIONAL REQUIREMENTS FOR YACHTS

CHAPTER 1 GENERAL REGULATIONS
Section 1 Introduction
Section 2 International Rating Class (IRC) Yachts

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Contents

CHAPTER 2 ALL YACHTS
Section 1 General
Section 2 Ship side valves
Section 3 Anchor stowage
Section 4 Bathing and watersport platforms and shell openings
Section 5 Deck safety equipment
Section 6 Protection of openings
Section 7 Corrosion protection
Section 8 Navigation in first-year ice conditions

CHAPTER 3 SPECIAL CONSIDERATIONS FOR SAILING YACHTS
Section 1 Hull design and construction parameters
Section 2 Hull construction
Section 3 Chain plates
Section 4 Deck planking
Section 5 Deck fittings
Section 6 Ballast keels
Section 7 Rudder skegs and rudders
Section 8 Open cockpits and companionways
Section 9 Anchoring and mooring equipment

PART 5 DESIGN AND LOAD CRITERIA

CHAPTER 1 GENERAL
Section 1 Rule application
Section 2 Direct calculations
Section 3 Model experiments

CHAPTER 2 LOCAL DESIGN LOADS
Section 1 Environmental conditions
Section 2 Definitions and symbols
Section 3 Motion response
Section 4 Loads on shell envelope
Section 5 Impact loads
Section 6 Cross-deck structure for multi-hull craft
Section 7 Component design loads

CHAPTER 3 LOCAL DESIGN CRITERIA FOR CRAFT OPERATING IN NON-DISPLACEMENT MODE
Section 1 General
Section 2 Nomenclature and design factors
Section 3 Hull envelope design criteria

CHAPTER 4 LOCAL DESIGN CRITERIA FOR CRAFT OPERATING IN DISPLACEMENT MODE
Section 1 General
Section 2 Nomenclature and design factors
Section 3 Hull envelope design criteria

CHAPTER 5 GLOBAL LOAD AND DESIGN CRITERIA
Section 1 General
Section 2 Hull girder load criteria for mono-hull craft
Section 3 Hull girder load criteria for multi-hull craft
Section 4 Primary load criteria for multi-hull craft
Section 5 Design criteria and load combinations
Section 6 Loading guidance information

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Contents

VOLUME 4, PART 6

PART 6 HULL CONSTRUCTION IN STEEL

CHAPTER 1 GENERAL
Section 1 Application
Section 2 General requirements

CHAPTER 2 CONSTRUCTION PROCEDURES
Section 1 General
Section 2 Materials
Section 3 Procedures for welded construction
Section 4 Joints and connections

CHAPTER 3 SCANTLING DETERMINATION FOR MONO-HULL CRAFT
Section 1 General
Section 2 Minimum thickness requirements
Section 3 Shell envelope plating
Section 4 Shell envelope framing
Section 5 Single bottom structure and appendages
Section 6 Double bottom structure
Section 7 Bulkheads and deep tanks
Section 8 Deck structures
Section 9 Superstructures, deckhouses and bulwarks
Section 10 Pillars and pillar bulkheads

CHAPTER 4 SCANTLING DETERMINATION FOR MULTI-HULL CRAFT
Section 1 General
Section 2 Minimum thickness requirements
Section 3 Shell envelope plating
Section 4 Shell envelope framing
Section 5 Single bottom structure and appendages
Section 6 Double bottom structure
Section 7 Bulkheads and deep tanks
Section 8 Deck structures
Section 9 Superstructures, deckhouses, pillars and bulwarks

CHAPTER 5 SPECIAL FEATURES
Section 1 General
Section 2 Special features
Section 3 Vehicle decks
Section 4 Bow doors
Section 5 Movable decks
Section 6 Helicopter landing areas
Section 7 Strengthening requirements for navigation in ice conditions

CHAPTER 6 HULL GIRDER STRENGTH
Section 1 General
Section 2 Hull girder strength for mono-hull craft
Section 3 Additional hull girder strength requirements for multi-hull craft

CHAPTER 7 FAILURE MODES CONTROL
Section 1 General
Section 2 Deflection control
Section 3 Stress control
Section 4 Buckling control
Section 5 Vibration control

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Contents

VOLUME 5, PART 7

PART 7 HULL CONSTRUCTION IN ALUMINIUM

CHAPTER 1 GENERAL
Section 1 Application
Section 2 General requirements

CHAPTER 2 CONSTRUCTION PROCEDURES
Section 1 General
Section 2 Materials
Section 3 Procedures for welded construction
Section 4 Joints and connections

CHAPTER 3 SCANTLING DETERMINATION FOR MONO-HULL CRAFT
Section 1 General
Section 2 Minimum thickness requirements
Section 3 Shell envelope plating
Section 4 Shell envelope framing
Section 5 Single bottom structure and appendages
Section 6 Double bottom structure
Section 7 Bulkheads
Section 8 Deck structures
Section 9 Superstructures, deckhouses and bulwarks
Section 10 Pillars and pillar bulkheads

CHAPTER 4 SCANTLING DETERMINATION FOR MULTI-HULL CRAFT

PART 9 GENERAL REQUIREMENTS FOR MACHINERY

CHAPTER 1 GENERAL REQUIREMENTS FOR MACHINERY
Section 1 General requirements
Section 2 Particulars to be submitted
Section 3 Certification of materials
Section 4 Operating conditions
Section 5 Securing of machinery
Section 6 Requirements for craft which are not required to comply with the HSC Code

CHAPTER 2 SURVEYS DURING CONSTRUCTION, INSTALLATION AND SEA TRIALS
Section 1 General requirements
Section 2 Diesel engines
Section 3 Turbo-chargers
Section 4 Gas turbines
Section 5 Gearing
Section 6 Shafting systems
Section 7 Propellers
Section 8 Water jet units
Section 9 Thrusters
Section 10 Steering systems
Section 11 Sea trials

PART 10 PRIME MOVERS

CHAPTER 1 DIESEL ENGINES
Section 1 General requirements
Section 2 Particulars to be submitted
Section 3 Materials
Section 4 Crankshaft design
Section 5 Construction and welded structures
Section 6 Safety arrangements on engines
Section 7 Starting arrangements
Section 8 Piping systems
Section 9 Control and monitoring
Section 10 Requirements for craft which are not required to comply with the HSC Code
Section 11 Mass produced engines
Section 12 Mass produced turbo-chargers
Section 13 Electronically controlled engines
Section 14 Programme for trials of diesel engines to assess operational capability
Section 15 Type testing procedure for crankcase explosion relief valves
Section 16 Type testing procedure for crankcase oil mist detection and alarm equipment

CHAPTER 2 GAS TURBINES
Section 1 General requirements
Section 2 Particulars to be submitted
Section 3 Materials
Section 4 Design
Section 5 Construction
Section 6 Starting arrangements
Section 7 Piping systems
Section 8 Control and monitoring
Section 9 Requirements for craft which are not required to comply with the HSC Code

PART 11 TRANSMISSION SYSTEMS

CHAPTER 1 GEARING
Section 1 General requirements
Section 2 Particulars to be submitted
Section 3 Materials
Section 4 Design of gearing
Section 5 Piping systems for gearing
Section 6 Control and monitoring
Section 7 Requirements for craft which are not required to comply with the HSC Code

CHAPTER 2 SHAFTING SYSTEMS
Section 1 General requirements
Section 2 Particulars to be submitted
Section 3 Materials
Section 4 Design and construction
Section 5 Control and monitoring
Section 6 Requirements for craft which are not required to comply with the HSC Code

PART 12 PROPULSION DEVICES

CHAPTER 1 PROPELLERS
Section 1 General requirements
Section 2 Plans and particulars
Section 3 Materials
Section 4 Propeller design
Section 5 Piping systems
Section 6 Control and monitoring
Section 7 Requirements for craft which are not required to comply with the HSC Code

CHAPTER 2 WATERJET SYSTEMS
Section 1 Scope
Section 2 General requirements
Section 3 Design requirements
Section 4 Piping systems
Section 5 Control and monitoring
Section 6 Electrical systems
Section 7 Inspection, testing and fitting of waterjets
Section 8 Installation, maintenance and replacement

CHAPTER 3 THRUSTERS
Section 1 General requirements
Section 2 Particulars to be submitted
Section 3 Materials
Section 4 Design and construction
Section 5 Piping systems
Section 6 Control and monitoring
Section 7 Electrical systems
Section 8 Requirements for craft which are not required to comply with the HSC Code

PART 13 SHAFT VIBRATION AND ALIGNMENT

CHAPTER 1 TORSIONAL VIBRATION
Section 1 General requirements
Section 2 Details to be submitted
Section 3 Design
Section 4 Measurements
Section 5 Requirements for craft which are not required to comply with the HSC Code

CHAPTER 2 HULL PIPING SYSTEMS
Section 1 General
Section 2 Construction and installation
Section 3 Shell valves and fittings (other than those on scuppers and sanitary discharges)
Section 4 Bilge pumping and drainage systems
Section 5 Bilge drainage of machinery spaces with a propulsion prime mover
Section 6 Emergency bilge drainage
Section 7 Size of bilge suction pipes
Section 8 Pumps on bilge service
Section 9 Bilge main arrangements and materials
Section 10 Submersible bilge pump arrangements
Section 11 Air, overflow and sounding pipes
Section 12 Requirements for multi-hull craft
Section 13 Additional requirements for Passenger (B) Craft
Section 14 Requirements for small craft which are not required to comply with the HSC Code
Section 15 Requirements for yachts and service craft of 24 m or greater in length, which are not required to comply with the HSC Code
Section 16 Additional requirements for yachts that are 500 gt or more
Section 17 Requirements for Air Cushion Vehicles

CHAPTER 3 MACHINERY PIPING SYSTEMS
Section 1 Application
Section 2 General requirements
Section 3 Oil fuel storage
Section 4 Oil fuel systems
Section 5 Low flash point fuels
Section 6 Lubricating/hydraulic oil systems
Section 7 Engine cooling water systems
Section 8 Miscellaneous machinery
Section 9 Special requirements for multi-hull craft
Section 10 Requirements for Passenger (A) Craft
Section 11 Requirements for small craft which are not required to comply with the HSC Code

CHAPTER 4 PRESSURE PLANT
Section 1 General requirements
Section 2 Cylindrical shells subject to internal pressure
Section 3 Spherical shells subject to internal pressure
Section 4 Dished ends subject to internal pressure
Section 5 Standpipes and branches
Section 6 Unstayed circular flat end plates
Section 7 Construction
Section 8 Requirements for fusion welded pressure vessels
Section 9 Mountings and fittings for pressure vessels
Section 10 Hydraulic tests
Section 11 Fibre reinforced plastics pressure vessels
Section 12 Requirements for craft which are not required to comply with the HSC Code

PART 16 CONTROL AND ELECTRICAL ENGINEERING

CHAPTER 1 CONTROL ENGINEERING SYSTEMS
Section 1 General requirements
Section 2 Essential features for control, alarm and safety systems
Section 3 Unattended machinery space(s) – UMS notation
Section 4 Machinery operated from a centralised control station – CCS notation
Section 5 Requirements for craft which are not required to comply with the HSC Code
Section 6 Trials

CHAPTER 2 ELECTRICAL ENGINEERING
Section 1 General requirements
Section 2 Main source of electrical power
Section 3 Emergency source of electrical power
Section 4 External source of electrical power
Section 5 Supply and distribution
Section 6 System design – Protection
Section 7 Switchgear and control gear assemblies
Section 8 Rotating machines
Section 9 Converter equipment
Section 10 Electrical cables and busbar trunking systems (busways)
Section 11 Batteries
Section 12 Equipment – Heating, lighting and accessories
Section 13 Electrical equipment for use in explosive atmospheres
Section 14 Navigation and manoeuvring systems
Section 15 Electric propulsion
Section 16 Fire safety systems
Section 17 Crew and passenger emergency safety systems
Section 18 Craft safety systems
Section 19 Cargo craft, patrol and pilot craft, workboats and other similar craft of less than 500 tons gross tonnage for operation in Service Groups 1 to 3, and yachts less than 500 gt
Section 20 Testing and trials

VOLUME 8, PART 17

PART 17 FIRE PROTECTION, DETECTION AND EXTINCTION

CHAPTER 1 FIRE PROTECTION, DETECTION AND EXTINCTION – GENERAL
Section 1 General requirements
Section 2 Definitions

CHAPTER 2 FIRE PROTECTION, DETECTION AND EXTINCTION – SERVICE CRAFT
Section 1 General requirements
Section 2 Fire safety measures for service craft

CHAPTER 3 FIRE PROTECTION, DETECTION AND EXTINCTION – YACHTS
Section 1 General requirements
Section 2 Fire safety measures for yachts of overall length greater than 24 m but less than 500 gt
Section 3 Fire safety measures for yachts 500 gt or more

CHAPTER 4 SYSTEM AND EQUIPMENT SPECIFICATIONS
Section 1 Automatic sprinkler, fire detection and fire-alarm systems
Section 2 Fixed fire detection and fire alarm systems
Section 3 Fixed fire-extinguishing systems in machinery spaces
Section 4 Fireman's outfits
Section 5 Fire-control plans
Section 6 Fire-extinguishers (portable and non-portable)

A guide to the Rules

and published requirements

Rules and Regulations for the Classification of Special Service Craft

Introduction

The Rules are published as a complete set; individual Parts are, however, available on request. A comprehensive List of Contents is placed at the beginning of each Part.

Numbering and Cross-References

A decimal notation system has been adopted throughout. Five sets of digits cover the divisions, i.e. Part, Chapter, Section, sub-Section and paragraph. The textual cross-referencing within the text is as follows, although the right hand digits may be added or omitted depending on the degree of precision required:

(a) In same Chapter, e.g. *see* 2.1.3 (i.e. down to paragraph).
(b) In same Part but different Chapter, e.g. *see* Ch 3,2.1 (i.e. down to sub-Section).
(c) In another Part, e.g. *see* Pt 5, Ch 1,3 (i.e. down to Section).

The cross-referencing for Figures and Tables is as follows:

(a) In same Chapter, e.g. as shown in Fig. 2.3.5 (i.e. Chapter, Section and Figure Number).
(b) In same Part but different Chapter, e.g. as shown in Fig. 2.3.5 in Chapter 2.
(c) In another Part, e.g. *see* Table 2.7.1 in Pt 3, Ch 2.

Rules updating

The Rules are generally published annually and changed through a system of Notices. Subscribers are forwarded copies of such Notices when the Rules change.

Current changes to Rules that appeared in Notices are shown with a black rule alongside the amended paragraph on the left hand side. A solid black rule indicates amendments and a dotted black rule indicates corrigenda.

Rules programs

LR has developed a suite of Calculation Software that evaluates Requirements for Ship Rules, Special Service Craft Rules and Naval Ship Rules. For details of this software please contact LR.

Direct calculations

The Rules require direct calculations to be submitted for specific parts of the ship structure or arrangements and these will be assessed in relation to LR's own direct calculation procedures. They may also be required for ships of unusual form, proportion or speed, where intended for the carriage of special cargoes or for special restricted service and as supporting documentation for arrangements or scantlings alternative to those required by the Rules.

July 2011

Lloyd's Register is an exempt charity under the UK Charities Act 1993

Lloyd's Register, its affiliates and subsidiaries and their respective officers, employees or agents are, individually and collectively, referred to in this clause as the 'Lloyd's Register Group'. The Lloyd's Register Group assumes no responsibility and shall not be liable to any person for any loss, damage or expense caused by reliance on the information or advice in this document or howsoever provided, unless that person has signed a contract with the relevant Lloyd's Register Group entity for the provision of this information or advice and in that case any responsibility or liability is exclusively on the terms and conditions set out in that contract.

CHAPTER 1 GENERAL REGULATIONS

Sections 1 to 8

CHAPTER 2 CLASSIFICATION REGULATIONS

Section 1 Conditions for classification
1.1 General
1.2 Application
1.3 Interpretation of the Rules
1.4 Scope of classification
1.5 Client's responsibilities

Section 2 Scope of the Rules
2.1 Applicable craft types
2.2 Definitions

Section 3 Character of classification and class notations
3.1 General
3.2 Character symbols
3.3 Class notations (hull)
3.4 High speed craft and light displacement craft notations
3.5 Service area restriction notations
3.6 Service type notations
3.7 Craft type notations
3.8 Other hull notations
3.9 Class notations (machinery)
3.10 Application notes
3.11 Class notations (Environmental Protection)
3.12 Descriptive notes

Section 4 Surveys – General
4.1 Statutory surveys
4.2 New construction surveys
4.3 Existing craft
4.4 Damages, repairs and alterations
4.5 Existing service craft and yachts – Periodical Surveys
4.6 Existing amphibious air cushion vehicles – Periodical Surveys
4.7 Certificates
4.8 Notice of surveys
4.9 Withdrawal/Suspension of class
4.10 Survey of craft out of commission
4.11 Appeal from Surveyors' recommendations

Section 5 IACS QSCS Audits
5.1 Audit of Surveys

Section 6 Type Approval/Type testing/Quality control system
6.1 LR Type Approval – Marine Applications
6.2 Type testing
6.3 Quality control system

Section 7 Classification of machinery for craft/yachts with [⊞]LMC or MCH notation
7.1 General
7.2 Appraisal and records
7.3 Survey and inspection

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

CHAPTER 3 PERIODICAL SURVEY REGULATIONS FOR SERVICE CRAFT

Section 1 General
1.1 Frequency of surveys
1.2 Surveys for damage or alterations
1.3 Unscheduled surveys
1.4 Surveys for the issue of Convention certificates
1.5 Definitions

Section 2 Annual Surveys – Hull and machinery requirements
2.1 General
2.2 Annual Surveys

Section 3 Intermediate Surveys – Hull and machinery requirements
3.1 General
3.2 Intermediate Surveys

Section 4 Docking Surveys and In-water Surveys – Hull and machinery requirements
4.1 General
4.2 Docking Surveys
4.3 In-water Surveys

Section 5 Special Survey – General – Hull requirements
5.1 General
5.2 Preparation
5.3 Examination and testing – General
5.4 Examination and testing – Additional items for steel craft
5.5 Examination and testing – Additional items for aluminium alloy craft
5.6 Examination and testing – Additional items for composite craft

Section 6 Special Survey – Thickness measurement requirements for steel craft
6.1 General
6.2 Thickness measurement reporting

Section 7 Machinery surveys – General requirements
7.1 Annual, Intermediate and Docking Surveys
7.2 Complete Surveys

Section 8 Gas turbines – Detailed requirements
8.1 Complete Surveys

Section 9 Oil engines – Detailed requirements
9.1 Complete Surveys

Section 10 Electrical equipment
10.1 Annual and Intermediate Surveys
10.2 Complete Surveys

Section 11 Screwshafts, tube shafts, propellers and water jet units
11.1 Frequency of surveys
11.2 Normal surveys
11.3 Screwshaft Condition Monitoring (SCM)
11.4 Modified Survey
11.5 Partial Survey

Section 12 Classification of craft not built under survey
12.1 General
12.2 Hull and equipment
12.3 Machinery

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

CHAPTER 4 PERIODICAL SURVEY REGULATIONS FOR YACHTS

Section 1 General
1.1 Frequency of surveys
1.2 Surveys for damage or alterations
1.3 Unscheduled surveys
1.4 Surveys for the issue of Convention certificates
1.5 Definitions

Section 2 Intermediate Surveys – Hull and machinery requirements
2.1 General
2.2 Intermediate Surveys

Section 3 Docking Surveys and In-water Surveys – Hull and machinery requirements
3.1 General
3.2 Docking Surveys
3.3 In-water Surveys

Section 4 Special Survey – General – Hull requirements
4.1 General
4.2 Preparation
4.3 Examination and testing – General
4.4 Examination and testing – Additional items for steel yachts
4.5 Examination and testing – Additional items for aluminium alloy yachts
4.6 Examination and testing – Additional items for composite yachts
4.7 Examination and testing – Additional items for wood yachts
4.8 Examination and testing – Additional items for sailing and auxiliary yachts

Section 5 Special Survey – Thickness measurement requirements for steel yachts
5.1 General
5.2 Thickness measurement reporting

Section 6 Machinery surveys – General requirements
6.1 Intermediate and Docking Surveys
6.2 Complete Surveys

Section 7 Gas turbines – Detailed requirements
7.1 Complete Surveys

Section 8 Oil engines – Detailed requirements
8.1 Complete Surveys

Section 9 Electrical equipment
9.1 Intermediate Surveys
9.2 Complete Surveys

Section 10 Screwshafts, tube shafts, propellers and water jet units
10.1 Frequency of surveys
10.2 Normal surveys
10.3 Screwshaft Condition Monitoring (SCM)
10.4 Modified Survey
10.5 Partial Survey

Section 11 Surveys of unclassed machinery in existing classed yachts
11.1 General
11.2 Intermediate and Docking Surveys
11.3 Complete Surveys

Section 12 Classification of yachts not built under survey
12.1 General
12.2 Hull and equipment
12.3 Machinery

■ *Section 1*

1.1 Lloyd's Register (hereinafter referred to as 'LR'), which is recognised under the laws of the United Kingdom as a corporate body and a charity established for the benefit of the community, was founded in 1760. It was established for the purpose of producing a faithful and accurate classification of merchant shipping. It now primarily produces classification Rules.

1.2 Classification services are delivered to clients by a number of other members of the Lloyd's Register Group, including: Lloyd's Register EMEA, Lloyd's Register Asia, Lloyd's Register North America, Inc., and Lloyd's Register Central and South America Limited.

1.3 The Lloyd's Register Group (hereinafter referred to as 'the LR Group') comprises charities, other forms of organisation and non-charitable companies, with the latter supporting the charities in their main goal of enhancing the safety of life and property, at sea, on land and in the air, for the benefit of the public and the environment.

■ *Section 2*

2.1 LR remains the sole classification society in the LR Group. LR is managed by a Board of Trustees (hereinafter referred to as 'the Board').

The Board has:

appointed a Classification Committee and determined its powers and functions and authorised it to delegate certain of its powers to a Classification Executive and Devolved Classification Executives;
appointed Technical Committees and determined their powers, functions and duties.

2.2 The LR Group has established National and Area Committees in the following:

Countries:
Australia (via Lloyd's Register Asia)
Canada (via Lloyd's Register North America, Inc.)
China (via Lloyd's Register Asia)
Egypt (via Lloyd's Register EMEA)
Federal Republic of Germany
(via Lloyd's Register EMEA)
France (via Lloyd's Register EMEA)
Italy (via Lloyd's Register EMEA)
Japan (via Lloyd's Register)
New Zealand (via Lloyd's Register Asia)
Poland (via Lloyd's Register (Polska) Sp zoo)
Spain (via Lloyd's Register EMEA)
United States of America (via Lloyd's Register North America, Inc.)

Areas:
Benelux (via Lloyd's Register EMEA)
Central America (via Lloyd's Register Central and South America Ltd)
Nordic Countries (via Lloyd's Register EMEA)
South Asia (via Lloyd's Register Asia)
Asian Shipowners (via Lloyd's Register Asia)
Greece (via Lloyd's Register EMEA)

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

■ *Section 3*

3.1 LR's Technical Committee is at present composed of a maximum of 80 members which includes:

Ex officio members:

- Chairman and Chief Executive Officer of LR .....
- Chairman of the Classification Committee of LR .....

Members Nominated by:

- Technical Committee .....
- Royal Institution of Naval Architects 2
- Institution of Engineers and Shipbuilders in Scotland 2
- Institute of Marine, Engineering, Science and Technology 2
- Institute of Materials, Minerals and Mining 1
- Honourable Company of Master Mariners 2
- Institution of Engineering and Technology 1
- Institute of Refrigeration 1
- Welding Institute 1
- Shipbuilders' and Shiprepairers' Association 2
- The Society of Consulting Marine Engineers and Ship Surveyors .....
- Community of European Shipyards Associations 1
- Society of Maritime Industries 2
- European Marine Equipment Council 1
- Chamber of Shipping 1
- Greek Shipping Co-operation Committee 1
- International Association of Oil and Gas Producers 1

3.2 In addition to the foregoing:

(a) Each National or Area Committee may appoint a representative to attend meetings of the Technical Committee.

(b) A maximum of five representatives from National Administrations may be co-opted to serve on the Technical Committee. Representatives from National Administrations may also be elected as members of the Technical Committee under one of the categories identified in 3.1.

(c) Further persons may be co-opted to serve on the Technical Committee by the Technical Committee.

3.3 All elections are subject to confirmation by the Board.

3.4 The function of the Technical Committee is to consider:

(a) any technical issues connected with LR's marine business;

(b) any proposed alterations in the existing Rules;

(c) any new Rules for classification;

Where changes to the Rules are necessitated by mandatory implementation of International Conventions, Codes or Unified Requirements adopted by the International Association of Classification Societies these may be implemented by LR without consideration by the Technical Committee.

3.5 The term of office of the Chairman and of all members of the Technical Committee is five years. Members may be re-elected to serve an additional term of office with the approval of the Board. The term of office of the Chairman may be extended with the approval of the Board.

3.6 In the case of continuous non-attendance of a member, the Technical Committee may withdraw membership.

3.7 Meetings of the Technical Committee are convened as often and at such times and places as is necessary, but there is to be at least one meeting in each year. Urgent matters may be considered by the Technical Committee by correspondence.

3.8 Any proposal involving any alteration in, or addition to, Part 1, Chapter 1 of Rules for Classification is subject to approval of the Board. All other proposals for additions to or alterations to the Rules for Classification other than Part 1, Chapter 1, will following consideration and approval by the Technical Committee either at a meeting of the Technical Committee or by correspondence, be recommended to the Board for adoption.

3.9 The Technical Committee is empowered to:

(a) appoint sub-Committees or panels; and

(b) co-opt to the Technical Committee, or to its sub-Committees or panels, representatives of any organisation or industry or private individuals for the purpose of considering any particular problem.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

■ *Section 4*

4.1 LR's Naval Ship Technical Committee is at present composed of a maximum of 50 members and includes:

Ex officio members

- Chairman and Chief Executive Officer of LR

Member nominated by:

- Naval Ship Technical Committee;
- The Royal Navy and the UK Ministry of Defence;
- UK Shipbuilders, Ship Repairers and Defence Industry;
- Overseas Navies, Governments and Governmental Agencies;
- Overseas Shipbuilders, Ship Repairers and Defence Industries;

4.2 All elections are subject to confirmation by the Board.

4.3 All members of the Naval Ship Technical Committee are to hold security clearance from their National Authority for the equivalent of NATO CONFIDENTIAL. All material is to be handled in accordance with NATO Regulations or, for non-NATO countries, an approved equivalent. No classified material shall be disclosed to any third party without the consent of the originator.

4.4 The term of office of the Naval Ship Technical Committee Chairman and of all members of the Naval Ship Technical Committee Chairman is five years. Members may be re-elected to serve an additional term of office with the approval of the Board. The term of the Chairman may be extended with the approval of the Board.

4.5 In the case of continuous non-attendance of a member, the Naval Ship Technical Committee may withdraw membership.

4.6 The function of the Naval Ship Technical Committee is to consider technical issues connected with Naval Ship matters and to approve proposals for new Naval Ship Rules, or amendments to existing Naval Ship Rules.

4.7 Meetings of the Naval Ship Technical Committee are convened as necessary but there will be at least one meeting per year. Urgent matters may be considered by the Naval Ship Technical Committee by correspondence.

4.8 Any proposal involving any alteration in, or addition to, Part 1, Chapter 1 of Rules for Classification of Naval Ships is subject to approval of the Board. All other proposals for additions to or alterations to the Rules for Classification of Naval Ships, other than Part 1, Chapter 1, will following consideration and approval by the Naval Ship Technical Committee, either at a meeting of the Naval Ship Technical Committee or by correspondence, be recommended to the Board for adoption.

4.9 The Naval Ship Technical Committee is empowered to:

(a) appoint sub-Committees or panels; and

(b) co-opt to the Naval Ship Technical Committee, or to its sub-Committees or panels, representatives of any organisation or industry or private individuals for the purpose of considering any particular problem.

■ *Section 5*

5.1 LR has the power to adopt, and publish as deemed necessary, Rules relating to classification and has (in relation thereto) provided the following:

(a) Except in the case of a special directive by the Board, no new Regulation or alteration to any existing Regulation relating to classification or to class notations is to be applied to existing ships.

(b) Except in the case of a special directive by the Board, or where changes necessitated by mandatory implementation of International Conventions, Codes or Unified Requirements adopted by the International Association of Classification Societies are concerned, no new Rule or alteration in any existing Rule is to be applied compulsorily after the date on which the contract between the ship builder and shipowner for construction of the ship has been signed, nor within six months of its adoption. The date of 'contract for construction' of a ship is the date on which the contract to build the ship is signed between the prospective shipowner and the ship builder. This date and the construction number (i.e. hull numbers) of all the vessels included in the contract are to be declared by the party applying for the assignment of class to a newbuilding. The date of 'contract for construction' of a series of sister ships, including specified optional ships for which the option is ultimately exercised, is the date on which the contract to build the series is signed between the prospective shipowner and the ship builder. In this section a 'series of sister ships' is a series of ships built to the same approved plans for classification purposes, under a single contract for construction. The optional ships will be considered part of the same series of sister ships if the option is exercised not later than 1 year after the contract to build the series was signed. If a contract for construction is later amended to include additional ships or additional options, the date of 'contract for construction' for such ships is the date

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

on which the amendment to the contract is signed between the prospective shipowner and the ship builder. The amendment to the contract is to be considered as a 'new contract'. If a contract for construction is amended to change the ship type, the date of 'contract for construction' of this modified vessel, or vessels, is the date on which the revised contract or new contract is signed between the Owner, or Owners, and the shipbuilder. Where it is desired to use existing approved ship or machinery plans for a new contract, written application is to be made to LR. Sister ships may have minor design alterations provided that such alterations do not affect matters related to classification, classification, or if the alterations are subject to classification requirements, these alterations are to comply with the classification requirements in effect on the date on which the alterations are contracted between the prospective owner and the ship builder or, in the absence of the alteration contract, comply with the classification requirements in effect on the date on which the alterations are submitted to LR for approval.

(c) All reports of survey are to be made by surveyors authorised by members of the LR Group to survey and report (hereinafter referred to as 'the Surveyors') according to the form prescribed, and submitted for the consideration of the Classification Committee.

(d) Information contained in the reports of classification and statutory surveys will be made available to the relevant owner, National Administration, Port State Administration, P&I Club, hull underwriter and, if authorised in writing by that owner, to any other person or organisation.

(e) Notwithstanding the general duty of confidentiality owed by LR to its client in accordance with the LR Rules, LR clients hereby accept that, LR will participate in the IACS Early Warning System which requires each IACS member to provide its fellow IACS members and Associates with relevant technical information on serious hull structural and engineering systems failures, as defined in the IACS Early Warning System (but not including any drawings relating to the ship which may be the specific property of another party), to enable such useful information to be shared and utilised to facilitate the proper working of the IACS Early Warning System LR will provide its client with written details of such information upon sending the same to IACS Members and Associates.

(f) Information relating to the status of classification and statutory surveys and suspensions/withdrawals of class together with any associated conditions of class will be made available as required by applicable legislation or court order.

(g) A Classification Executive consisting of senior members of LR's Classification Department staff shall carry out whatever duties that may be within the function of the Classification Committee that the Classification Committee assigns to it.

■ *Section 6*

6.1 No LR Group employee is permitted under any circumstances, to accept, directly or indirectly, from any person, firm or company, with whom the work of the employee brings the employee into contact, any present, bonus, entertainment or honorarium of any sort whatsoever which is of more than nominal value or which might be construed to exceed customary courtesy extended in accordance with accepted ethical business standards.

■ *Section 7*

7.1 LR has the power to withhold or, if already granted, to suspend or withdraw any ship from class (or to withhold any certificate or report in any other case), in the event of non-payment of any fee to any member of the LR Group.

■ *Section 8*

8.1 When providing services LR does not assess compliance with any standard other than the applicable LR Rules, international conventions and other standards agreed in writing.

8.2 In providing services, information or advice, the LR Group does not warrant the accuracy of any information or advice supplied. Except as set out herein, LR will not be liable for any loss, damage or expense sustained by any person and caused by any act, omission, error, negligence or strict liability of any of the LR Group or caused by any inaccuracy in any information or advice given in any way by or on behalf of the LR Group even if held to amount to a breach of warranty. Nevertheless, if the Client uses LR's services or relies on any information or advice given by or on behalf of the LR Group and as a result suffers loss, damage or expense that is proved to have been caused by any negligent act, omission or error of the LR Group or any negligent inaccuracy in information or advice given by or on behalf of the LR Group, then a member of the LR Group will pay compensation to the client for its proved loss up to but not exceeding the amount of the fee (if any) charged for that particular service, information or advice.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

8.3 Notwithstanding the previous clause, the LR Group will not be liable for any loss of profit, loss of contract, loss of use or any indirect or consequential loss, damage or expense sustained by any person caused by any act, omission or error or caused by any inaccuracy in any information or advice given in any way by or on behalf of the LR Group even if held to amount to a breach of warranty.

8.4 Any dispute about LR's services is subject to the exclusive jurisdiction of the English courts and will be governed by English law.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Section

1 **Conditions for classification**

2 **Scope of the Rules**

3 **Character of classification and class notations**

4 **Surveys – General**

5 **IACS QSCS Audits**

6 **Type Approval/Type testing/ Quality control system**

7 **Classification of machinery for craft/yachts with [⊠] LMC or MCH notation**

■ *Section 1* Conditions for classification

1.1 General

1.1.1 The *Rules and Regulations for the Classification of Special Service Craft* (hereinafter referred to as the Rules for Special Service Craft), are applicable to those types of craft which are defined in 2.1. Where the word craft is used in the text of the Rules, it is to be taken as being applicable to yachts and other craft as stated herein unless specifically indicated otherwise.

1.1.2 The Rules are framed on the understanding:

(a) that the craft will at all times be properly loaded. They do not, unless stated or implied in the class notation, provide for special distributions or concentrations of loading associated with the operation of the craft. Lloyd's Register (hereinafter referred to 'LR') may require additional strengthening to be fitted in any craft, which, in their opinion, would otherwise be subjected to severe stresses due to particular features in the design or operation, or where it is desired to make provision for exceptional loading conditions. In such cases particulars and details of the required loadings are to be submitted for consideration,

(b) that the craft will at all times be properly handled, with particular reference to the placing on board of persons and equipment and the reduction of speed in heavy weather,

(c) that compliance with the Rules does not relieve the designer of his responsibilities to his client for compliance with the specification and the requirements for the overall design and in service performance of the craft,

(d) that the craft will not be operated outside of the para-meters specified in any operational envelope which may have been assigned, without the prior agreement of LR.

1.1.3 New craft built in accordance with the Rules, or in accordance with requirements equivalent thereto, will be assigned a class in the appropriate *Register Book* and will continue to be classed so long as they are found, upon examination at the prescribed surveys, to be maintained in accordance with the requirements of the Rules. Classification will be conditional upon compliance with LR's requirements for both hull and machinery.

1.1.4 The class notations of yachts will be recorded on the ClassDirect Live website. The class notations of other craft will be recorded on the ClassDirect Live website in the *Register of Ships*.

1.1.5 LR, in addition to requiring compliance with the Rules, will, in general, require to be satisfied that craft are suitable for the geographical or other limits or conditions of the service contemplated.

1.1.6 Loading conditions and any other preparations required to permit a craft with a notation specifying some service limitation to undertake a sea-going voyage, either from port of building to service area or from one service area to another, are to be in accordance with arrangements agreed by LR prior to the voyage.

1.1.7 Any damage, defect, breakdown or grounding, which could invalidate the conditions for which a class has been assigned, is to be reported to LR without delay. Any detention or arrest is also to be reported to LR without delay.

1.1.8 Where the provision of loading or stress monitoring equipment has been required by LR as the result of local, longitudinal or transverse strength calculations and the imposition of operating limitations, the necessary loading guidance information and operating instructions are to be incorporated in the relevant manuals supplied to the Master.

1.1.9 Where an onboard computer system having longitudinal strength computation capability, which is required by the Rules, is provided on a new craft, or newly installed on an existing craft, then the system is to be certified in respect of longitudinal strength use in accordance with LR's document entitled *Approval of Longitudinal Strength and Stability Calculation Programs.*

1.1.10 Where an onboard computer system having stability computation capability is provided on a new craft, then the system is to be certified in respect of stability aspects in accordance with LR's document entitled, *Approval of Longitudinal Strength and Stability Calculation Programs*. When provided, an onboard computer system having stability computation capability is to carry out the calculations and checks necessary to assess compliance with all the stability requirements applicable to the craft on which it is installed.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.1.11 For craft, the arrangements and equipment of which are required to comply with the requirements of the:

- *International Convention on Load Lines, 1966*:
- *International Convention for the Safety of Life at Sea, 1974* and its protocol of 1978, which includes the *International Code of Safety for High Speed Craft*:
- *International Convention for the Prevention of Pollution from ships, 1974*, as modified by the Protocol of 1978 relating thereto:

and applicable Amendments thereto, the Committee requires the applicable Convention Certificates to be issued by a National Administration, or by LR, or by an IACS Member when so authorised. Safety Management Certificates in accordance with the provisions of the *International Safety Management Code* (ISM Code) may be issued by an organisation complying with IMO Resolution A.739(18) and authorised by the National Authority with which the craft is registered. Cargo Ship Radio Certificates may be issued by an organisation authorised by the National Authority with which the craft is registered.

1.1.12 In the case of dual classed craft, Convention certificates may be issued by the other classification society with which the craft is classed provided this is recognised in a formal Dual Class Agreement with LR and provided the other classification society is also authorised by the National Authority.

1.1.13 Yachts with a load line length, of 24m and over, having a service type notation of **Yacht**, will be assigned class only after it has been demonstrated that the stability of the yacht complies with the stability requirements of the UK MCA's Large Commercial Yacht Code, or the requirements of the National Administration, provided these are as a minimum equivalent to the requirements of the UK MCA LY Code (as amended).

1.1.14 Yachts with a load line length between 24 m and 85 m and with a gross tonnage less than 3000 will be assigned a service type notation **Yacht(S)** only after it has been demonstrated that the intact stability complies with the UK MCA LY2 Code for multi hulls and sailing vessels and the IMO IS 2008 Code for mono hull motor vessels (as amended) Damage stability is to be in compliance with the UK MCA LY2 Code (as amended). Alternative requirements may be acceptable, subject to acceptance by LR.

1.1.15 Yachts with a load line length of 85 m and above or with a gross tonnage of 3000 and above will be assigned a service type notation **Yacht(S)** only after it has been demonstrated that the intact stability complies with the UK MCA LY2 Code for multi hulls and sailing vessels (as amended). Damage stability is to be in compliance with the SOLAS requirements for passenger vessels (as amended). Alternative requirements may be acceptable, subject to acceptance by LR.

1.2 Application

1.2.1 Except in the case of a special directive by the Committee, no new Regulation or alteration to any existing Regulation relating to character of classification or to class notations is to be applied to existing craft.

1.3 Interpretation of the Rules

1.3.1 The interpretation of the Rules is the sole responsibility, and at the sole discretion, of LR.

1.4 Scope of classification

1.4.1 Classification covers the structural design, watertight integrity and standard of construction of the hull and construction, installation and testing of the propulsion machinery, essential auxiliary machinery, essential piping and electrical systems to the extent indicated within these Rules.

1.4.2 Outfit, other than that covered by 1.4.1, general finish, noise levels, vibration (other than shaft vibration where applicable), trim, design speed and stability, except as mentioned in 1.1.11, 1.1.13 and 1.1.14 are outside the scope of classification.

1.4.3 Where a craft is to be fitted with sails, the masts, rigging and sail arrangements are left to the judgment and experience of the Owner, the Builders and the designers, and LR does not accept responsibility for them. However, for classification purposes the attending Surveyor must be satisfied that they are being maintained in a satisfactory condition.

1.4.4 Where a craft is so badly damaged that class has to be suspended, LR is prepared to assist the Owner with advice if requested.

1.4.5 The attention of Owners and Builders is drawn to statutory requirements which may be imposed by the relevant National Administration and which may not be within the scope of classification.

1.5 Client's responsibilities

1.5.1 The Client is to give LR's Surveyors every facility and necessary access to carry out their survey duties. The Client should familiarise himself with the relevant LR Rules and, where appropriate, arrange that all sub-contractors, suppliers of components, materials or equipment do the same.

1.5.2 The survey procedures undertaken by LR when providing services are on the basis of periodical visits involving both monitoring and direct survey, and LR's Surveyors will not be in continual attendance at LR's Client's premises. As construction and outfitting are continuous processes, the Builder has the overall responsibility to his client to ensure and document that the requirements of the Rules, approved drawings and any agreed amendments made by the attending LR Surveyors have been complied with.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Section 2
Scope of the Rules

2.1 Applicable craft types

2.1.1 The Rules are applicable to the following craft types constructed from steel, aluminium alloy, composite materials or combinations of these materials:

(a) High speed craft.
(b) Light displacement craft.
(c) Multi-hull craft.
(d) Yachts of overall length, L_{OA}, 24 m or greater.
(e) Craft with draught to depth ratio less than or equal to 0,55.

2.1.2 The following craft types will be considered upon request on the basis of the Rules:

(a) Amphibious air cushion vehicles.
(b) Rigid inflatable boats.
(c) Hydrofoil craft.
(d) Foil assisted craft.
(e) Craft as defined 2.1.1(a) to (e) constructed from wood or wood/composite combinations.
(f) Other craft constructed from composite materials.
(g) Craft with a Rule length, L_R, less than 24 m and draught to depth ratio greater than 0,55.

2.1.3 Existing yachts, regardless of length, are subject to the survey requirements defined in Chapter 4.

2.1.4 The Rules incorporate those requirements of the *International Convention for the Safety of Life at Sea, 1974* as amended (SOLAS 74) Chapter X – Safety Measures for High Speed Craft (*International Code of Safety for High Speed Craft*) hereinafter referred to as the HSC code, as applicable to the classification of such craft.

2.1.5 At the discretion of LR craft types which are specifically covered by LR's *Rules and Regulations for the Classification of Ships* (hereinafter referred to as the Rules for Ships) or other LR Rules and Regulations for Classification may be considered for classification in accordance with these Rules and Regulations.

2.1.6 Where any aspect of the design or construction is not covered by the Rules, the relevant requirements of the Rules for Ships or the *Rules and Regulations for the Classification of Naval Ships* (hereinafter referred to as the Rules for Naval Ships) will be applied as considered necessary.

2.2 Definitions

2.2.1 For the purpose of the Rules, the definitions given in 2.2.2 to 2.2.29 will apply.

2.2.2 **Air Cushion Vehicle.** An Air Cushion Vehicle (ACV) is a craft such that the whole or a significant part of its weight can be supported, whether at rest or in motion, by a continuously generated cushion of air dependent for its effectiveness on the proximity of the surface over which the craft operates.

2.2.3 **Assisted craft.** An assisted craft is any craft operating on a route where it has been demonstrated to the satisfaction of the Administrations concerned that there is a high probability that in the event of an evacuation at any point of the route, all passengers and crew can be rescued safely within the time specified in the HSC Code.

2.2.4 **Catamaran.** A catamaran is a craft with twin-hulls linked by a bridging structure.

2.2.5 **Composite materials.** Composite materials are those construction materials consisting principally of fibre reinforced plastics.

2.2.6 **Design waterline** is the waterline corresponding to the maximum operational weight of the craft with no lift or propulsion machinery active.

2.2.7 **Foil assisted craft.** A foil assisted craft is a craft designed such that a significant part of its weight, whilst in motion, is supported by hydrodynamic lift generated by foils.

2.2.8 **High speed craft.** A high speed craft is a craft capable of maximum speed, V, *see* 2.2.11, not less than:

$$V = 7{,}19\,\nabla^{1/6} \text{ knots}$$

where

∇ = moulded displacement, in m^3, of the craft corresponding to the design waterline.

2.2.9 **Hydrofoil craft.** A hydrofoil craft is a craft which is supported above the water surface in non-displacement mode by hydrodynamic forces generated by foils.

2.2.10 **Light displacement craft.** A light displacement craft is a craft with a displacement not exceeding:

$$\Delta = 0{,}04(L_R B)^{1,5} \text{ tonnes}$$

where

L_R and B are defined in Pt 3, Ch 1.

2.2.11 **Maximum speed.** Maximum speed is the speed, in knots, achieved at the maximum continuous power for which the craft is certified at maximum operational weight and in smooth water.

2.2.12 **Mono-hull craft.** A mono-hull craft is a craft whose single hull may be of displacement form or of a semi-planing or planing form subject to some support by hydrodynamic lift.

2.2.13 **Multi-hull craft.** A multi-hull craft is a craft with two or more hulls linked by a bridging structure which may be of displacement form or of a semi-planing or planing form subject to some support by hydrodynamic lift.

2.2.14 **Operational speed.** Operational speed is the speed, in knots, corresponding to that permitted by the operational envelope. For High Speed Craft it is not more than 90 per cent of the maximum speed.

2.2.15 **Operational envelope.** The operational envelope defines the craft's service in terms of operational speeds, wave heights, displacements, service area and time required to seek refuge.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2.2.16 **Passenger.** A passenger is every person other than:

(a) The Master and the members of the crew or other persons employed or engaged in any capacity on board a craft on the business of that craft, and

(b) a child under one year of age.

2.2.17 **Passenger craft.** A passenger craft is a craft which carries more than twelve passengers.

2.2.18 **Patrol craft.** A patrol craft is a craft which may be operated by the harbour, police, customs, military authorities, search and rescue or similar organisations.

2.2.19 **Pilot launch.** A pilot launch is a craft designed to come alongside ships whilst at sea to embark or disembark pilots.

2.2.20 **Place of refuge.** A place of refuge is any naturally or artificially sheltered area which may be used as a shelter by a craft under conditions likely to endanger its safety.

2.2.21 **Range to refuge.** Range to refuge is the maximum allowable distance in nautical miles, measured along the shortest safe navigational track from any point on the intended voyage route of the craft to the nearest accessible harbour or place of refuge.

2.2.22 **Reasonable weather.** Reasonable weather is defined as wind strengths of force six or less on the Beaufort scale, associated with:

(a) Sea states within the operational envelope which are sufficiently moderate to ensure that green water is taken on board at infrequent intervals only or not at all.

(b) Motions such as do not impair the efficient operation of the craft and do not significantly reduce passenger comfort or safety or impose any undue loads on any cargo carried.

2.2.23 **Rigid Inflatable Boat.** A Rigid Inflatable Boat (RIB) is a craft combining a rigid hull enclosed by a watertight self-draining deck situated above the deepest operational load waterline and provided with a gas, air or foam-filled flotation collar/fender at the edge of the deck above the hull to improve the stability and to augment the reserve of buoyancy and sea-keeping ability of the rigid hull.

2.2.24 **Service craft.** Service craft is any craft within the scope of the Rules other than a yacht or an amphibious air cushion vehicle.

2.2.25 **Small Waterplane Area Twin Hull Ship.** A Small Waterplane Area Twin Hull Ship (SWATH) is a twin-hulled craft characterised by bulbous lower hulls (torpedoes) and relatively narrow struts connecting them to the haunches and deck structure.

2.2.26 **Surface Effect Ship.** A Surface Effect Ship (SES) is an air-cushion vehicle whose cushion is totally or partially retained by permanently immersed rigid structures.

2.2.27 **Unassisted craft.** An unassisted craft is any craft other than an assisted craft, with machinery and safety systems arranged such that, in the event of damage disabling any essential machinery and safety systems in one compartment, the craft retains the capability to navigate safely as defined in the HSC Code.

2.2.28 **Wave piercer.** A wave piercer is a particular type of catamaran with lower hulls of a displacement or semi-displacement form that provide a positive freeboard when at rest in smooth water but which are expected to become partially submerged when advancing in waves.

2.2.29 **Yacht.** A yacht is a recreational craft used for sport or pleasure and may be propelled mechanically, by sail or by a combination of both.

2.2.30 **Workboat.** A workboat is a general purpose service craft which may be adapted for duties such as line handling, towing, tender, survey, fishing, oil spill recovery, or diving support.

Section 3
Character of classification and class notations

3.1 General

3.1.1 This Section details the character symbols and notations which comprise the class assigned to special service craft.

3.1.2 The operational envelope assigned to craft built and classed in accordance with the Rules will be included in the operational manual of the craft where such a manual is required by the Rules. A reference to the operational envelope will be made in the Classification Certificate.

3.1.3 Craft built and classed in accordance with the Rules for restricted service but which are not assigned an operational envelope will have their geographical limits included in the Classification Certificate.

3.2 Character symbols

3.2.1 All craft, when classed, will be assigned a character of classification comprising one or more character symbols as applicable, e.g. **✠100A1 SSC.**

3.2.2 A full list of character symbols for which craft may be eligible is as follows:

✠ This distinguishing mark will be assigned, at the time of classing, to new craft constructed under LR's Special Survey, in compliance with the Rules, and to the satisfaction of the Committee.

$\overline{✠}$ This distinguishing mark will be assigned, at the time of classing, to new craft constructed under LR's Special Survey in accordance with plans approved by another recognised classification society.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

100 This character figure will be assigned to all craft considered suitable for sea-going service except those in Service Group 1, *see* 3.5.5.

A This character letter will be assigned to all craft which have been built or accepted into class in accordance with LR's Rules and Regulations, and which are maintained in good and efficient condition.

1 This character figure will be assigned to:
(a) Craft having on board, in good and efficient condition, anchoring and/or mooring equipment in accordance with the Rules.
(b) Craft classed for a specific service, having on board, in good and efficient condition, anchoring and/or mooring equipment approved by the Committee as suitable and sufficient for the particular service.

N This character letter will be assigned to craft on which the Committee has agreed that anchoring and mooring equipment need not be fitted in view of their particular service.

T This character letter will be assigned to ships which are intended to perform their primary designed service function only while they are anchored, moored, towed or linked, and which have, in good and efficient condition, adequately attached anchoring, mooring, towing or linking equipment which has been approved by the Committee as suitable and sufficient for the intended service.

SSC These character letters will be assigned to craft indicating that the craft has been constructed or accepted into class on the basis of the Rules.

3.2.3 For classification purposes the character figure **1** or the character letter **N** is to be assigned.

3.2.4 In cases where the anchoring and/or mooring equipment is found to be seriously deficient in quality or quantity, the class of the craft will be liable to be withheld.

3.3 Class notations (hull)

3.3.1 When considered necessary by the Committee, or when requested by an Owner and agreed by the Committee, a class notation will be appended to the character of classification assigned to the craft. The class notation will consist of one of, or a combination of:
(a) a high speed craft notation;
(b) a light displacement craft notation;
(c) a service area restriction notation;
(d) a service type notation; and
(e) a craft type notation;
(f) other hull notations;
e.g.
✠100A1 SSC Passenger (A) Catamaran
HSC G3 'service area'
✠100A1 SSC Yacht Catamaran
LDC G5.

3.3.2 A list of class notations (hull) for which a craft may be eligible is given in 3.4 to 3.10.

3.4 High speed craft and light displacement craft notations

3.4.1 **HSC – High speed craft notation.** This class notation will be assigned to high speed craft as defined in 2.2.8.

3.4.2 **LDC – Light displacement craft notation.** This class notation will be assigned to light displacement craft as defined in 2.2.10.

3.5 Service area restriction notations

3.5.1 All craft classed under the Rules will be assigned a service area restriction notation **G** followed by a number e.g. **G1.** Craft classed under the Rules for service groups **G1** to **G5** are not suitable for unrestricted service except as noted in the service area restriction notation, *see* 3.5.5.

3.5.2 Service area restriction notations, given in 3.5.5, are expressed in terms of range to refuge in nautical miles as defined in 2.2.20.

3.5.3 Where craft are required to satisfy limitations in respect of the maximum duration of time to a place of refuge from any point during the voyage, this time is to be determined by dividing the range to refuge by the permitted operational speed of the craft (when fully laden) in the prevailing conditions as imposed by the operational envelope.

3.5.4 For craft that are designed in accordance with an operational envelope, typically **HSC** or **LDC** craft as defined in 3.4:
- these craft are to be operated at reduced speeds and are to seek calmer waters or refuge when the weather conditions deteriorate or are predicted to deteriorate such that the limits of the operational envelope are exceeded.

For craft that are not assigned an operational envelope:
- these craft are to be operated at reduced speeds and are to seek calmer waters or refuge when the weather conditions deteriorate or are predicted to deteriorate.

All craft are to be aware of the weather forecast for the proposed and current areas of operation and area of refuge.

3.5.5 The service area restriction notations defined below describe the service area restriction for which the craft has been approved and constructed.

G1 **Service Group 1** covers craft intended for service in sheltered waters adjacent to sandbanks, estuaries, reefs, breakwaters or other coastal features and in similarly sheltered waters between islands in reasonable weather where the range to refuge is, in general, five nautical miles or less. The geographical limits of the intended service are to be identified by the Builder and agreed with LR. Craft in this group are not eligible for the assignment of the character figure **100.**

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

G2 **Service Group 2** covers craft intended for service in reasonable weather, in waters where the range to refuge is 20 nautical miles or less. This group will usually cover craft intended for service in coastal waters, for which geographical limits are to be identified by the Builder and agreed with LR.

G3 **Service Group 3** covers craft intended for service in waters where the range to refuge is 150 nautical miles or less. The geographical limits of the intended service are to be reported to LR.

G4 **Service Group 4** covers craft intended for service in waters where the range to refuge is 250 nautical miles or less. The geographical limits of the intended service are to be reported to LR.

G5 **Service Group 5** covers craft intended for service in waters where the range to refuge is 350 nautical miles or less. The geographical limits of the intended service are to be reported to LR.

G6 **Service Group 6** covers yachts and steel patrol craft having unrestricted service.

3.5.6 Consideration may be given to requests for an increase in the permissible range to refuge subject to:

(a) The specific geographic limits and the period over which the extended service is to be operated being defined.
(b) Satisfactory statistical data in respect of wave height, being provided to demonstrate that the craft will be suitable for the extended service.
(c) Equipment consistent with that required for the extended service being provided onboard during the period of operation.
(d) Any maximum duration of voyage limitations imposed by 3.5.3 not being exceeded during the extended service.

3.6 Service type notations

3.6.1 The service type notation will be recorded in the appropriate *Register Book* indicating the primary purpose for which the craft has been designed and constructed.

3.6.2 A list of service type notations for which craft may be eligible is given below:

Cargo (A) This notation will be assigned to cargo craft other than Cargo (B) craft.

Cargo (B) This notation will be assigned to unassisted high speed cargo craft of 500 gross tons and over which do not proceed in the course of their voyage more than eight hours at operational speed from a place of refuge when fully laden. These craft correspond to 'Cargo Craft' as defined in the HSC Code.

Passenger This notation will be assigned to passenger craft other than **Passenger (A)** or **Passenger (B)** craft.

Passenger (A) This notation will be assigned to assisted high speed craft carrying not more than 450 passengers on board and which do not proceed in the course of their voyage more than four hours at operational speed from a place of refuge when fully laden. These craft correspond to 'Category A Craft' as defined in the HSC Code.

Passenger (B) This notation will be assigned to unassisted high speed craft which may carry more than 450 passengers on board and which do not proceed in the course of their voyage more than four hours at operational speed from a place of refuge when fully laden. These craft correspond to 'Category B Craft' as defined in the HSC Code.

Patrol This notation will be assigned to patrol craft complying with the relevant requirements of the Rules.

Pilot This notation will be assigned to pilot launches complying with the relevant requirements of the Rules.

Yacht This notation will be assigned to all yachts.

Workboat This notation will be assigned to workboats complying with the relevant requirements of the Rules.

3.7 Craft type notations

3.7.1 The craft type notation will be recorded in the appropriate *Register Book* indicating the type of hull form and mode of operation for which the craft has been designed and constructed.

3.7.2 A list of craft type notations for which craft may be eligible is given below:

ACV This notation will be assigned to amphibious air cushion vehicles.

Catamaran This notation will be assigned to catamarans including wave piercers.

Hydrofoil This notation will be assigned to hydrofoil craft.

Mono This notation will be assigned to mono-hull craft other than amphibious air cushion vehicles, hydrofoils and rigid inflatable boats.

Multi This notation will be assigned to multi-hull craft other than catamarans, swaths and surface effect ships.

RIB This notation will be assigned to rigid inflatable boats.

SES This notation will be assigned to surface effect ships.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Swath This notation will be assigned to small water-plane area twin hull ships.

3.7.3 Where craft indicated in 3.7.2 are foil assisted the letters (FA) may be appended to the Craft Type Notation.

3.8 Other hull notations

3.8.1 **Ice class notation.** A class notation for navigation in first year ice conditions will be specially considered.

3.8.2 ***IWS.** This notation (In-water Survey) may be assigned to a craft where the applicable requirements of LR's Rules and Regulations are complied with. (*See* Ch 3,4.3 and Ch 4,3.3, *see also* Pt 3, Ch 3,2.37).

3.8.3 **Special features notation.** A notation indicating that the craft incorporates special features which significantly affect the design, e.g. movable decks.

3.8.4 **LI.** This notation will be assigned where an approved loading instrument has been installed as a classification requirement.

3.9 Class notations (machinery)

3.9.1 The following class notations may be assigned as considered appropriate by the Committee:

✠LMC This notation will be assigned when the propelling and essential auxiliary machinery has been constructed, installed and tested under LR's Special Survey and in accordance with LR's Rules and Regulations.

$\overline{✠}$ LMC This notation will be assigned when the propelling and essential auxiliary machinery has been constructed under the survey of a recognised authority in accordance with the Rules and Regulations equivalent to those of LR. In addition, the whole of the machinery will be required to have been installed and tested under LR's Special Survey in accordance with LR's Rules and Regulations.

[✠]LMC This notation will be assigned when the propelling arrangements, steering systems, pressure vessels and the electrical equipment for essential systems have been constructed, installed and tested under LR's Special Survey and are in accordance with LR's Rules and Regulations. Other items of machinery for propulsion and electrical power generation including propulsion gearing arrangements and other auxiliary machinery for essential services that are in compliance with LR Rules and supplied with the manufacturer's certificate will be acceptable under this notation. The system arrangements of propelling and essential auxiliary machinery are required to be appraised by LR, and found to be acceptable to LR. *See* 3.10.2.

LMC This notation (without ✠) will be assigned when the propelling and essential auxiliary machinery has neither been constructed nor installed under LR's Special Survey but the existing machinery, its installation and arrangement, has been tested and found to be acceptable to LR. This notation is assigned to existing craft in service accepted or transferring into LR class.

MCH This notation will be assigned when the propelling and essential auxiliary machinery has been installed and tested under LR's survey requirements and found to be acceptable to LR. Items of machinery and equipment for propelling and auxiliary machinery for essential services supplied with the manufacturer's certificate will be acceptable under this class notation. The system arrangements of propelling and essential auxiliary machinery are required to be appraised by LR, and found to be acceptable to LR. *See* 3.10.1.

UMS This notation may be assigned when the control engineering equipment has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto and the arrangements are such that the craft can be operated with the machinery spaces unattended.

CCS This notation may be assigned when the arrangements are such that the machinery may be operated with continuous supervision from a centralised control station. It denotes that the control engineering equipment has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.

3.9.2 Machinery class notations will not be assigned to craft the hulls of which are not classed or intended to be classed with LR.

3.9.3 The notation **✠LMC**, **$\overline{✠}$ LMC**, **[✠]LMC**, **LMC** (without ✠) and **MCH** will in general not be assigned to non-propelled craft, but individual cases will be considered on their merits.

3.10 Application notes

3.10.1 Propelling and essential auxiliary machinery includes machinery, equipment and systems installed for the craft/yacht to be under seagoing conditions and that are necessary for the following:

(a) Maintaining the watertight and weathertight integrity of the hull and spaces within the hull.
(b) The safety of the craft/yacht, machinery and personnel on board.
(c) The functioning and dependability of propulsion, steering and electrical systems.
(d) The operation and functioning of control engineering systems for the monitoring and safety of propulsion, steering and electrical power systems.
(e) The operation and functioning of emergency machinery and equipment.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

3.10.2 **Manufacturer's certificate** for assignment of the **[⊕]LMC** notation. Acceptance of the manufacturer's certificate for items of machinery for propulsion (including propulsion gearing with single input/output arrangements) and for electrical power generation and for other auxiliary machinery for essential services is subject to the following:

(a) For a craft: The craft is intended for the carriage of cargo (not passengers), is less than 500 gross tonnage or is of 500 gross tonnage or greater and is not required to comply with international conventions applicable to a craft with unrestricted service.

(b) For a yacht: The yacht has a gross tonnage of less than 500, or has a gross tonnage of 500 or more and is not required to comply with international conventions applicable to a yacht with unrestricted service.

(c) Propulsion power is provided by oil engines or gas turbines which have been type approved to LR requirements for marine application.

(d) Electrical power is provided by generators driven by oil engines or gas turbines which have been type approved to LR requirements for marine application.

(e) The design and manufacturing standards for all machinery and associated systems are the applicable LR Rules.

(f) The machinery and equipment is manufactured under a recognised quality control system.

(g) Propellers, propulsion shafting and multiple input/output gearboxes are not included within the scope of propulsion arrangements for acceptance of a manufacturer's certificate.

3.10.3 **Manufacturer's certificate** for assignment of the **MCH** notation. Acceptance of the manufacturer's certificate for propelling and essential auxiliary machinery is subject to the following:

(a) For a craft: The craft is intended for the carriage of cargo (not passengers), is less than 500 gross tonnage or is of 500 gross tonnage or greater and is not required to comply with international conventions applicable to a craft with unrestricted service.

(b) For a yacht: The yacht is less than 500 gross tonnage or is of 500 gross tonnage or more and is not required to comply with international conventions applicable to a yacht with unrestricted service.

(c) Propulsion power is provided by oil engines or gas turbines which have been type approved to LR requirements for marine application.

(d) Electrical power is provided by generators driven by oil engines or gas turbines which have been type approved to LR requirements for marine application.

(e) The power of any engine or gas turbine is less than 2,250 kW and the cylinder bore of any diesel engine is not greater than 300 mm.

(f) The design and manufacturing standards for machinery and associated systems are the applicable LR Rules or other marine standards acceptable to LR.

(g) The machinery and equipment is manufactured under a recognised quality control system.

3.11 Class notations (Environmental Protection)

3.11.1 The following class notations are associated with the design and operation of a Special Service Craft and may be assigned as considered appropriate by the Committee, on application from the Owners:

EP This notation may be assigned when the design and operation of a Special Service Craft are in accordance with the relevant requirements in Pt 7, Ch 11 of the Rules.

$\overline{\text{EP}}$ This notation may be assigned when the environmental protection provisions of the Special Service Craft are in accordance with the requirements of another recognised classification society and are broadly equivalent to the requirements in Pt 7, Ch 11 of the Rules. Prior to assignment of the notation, an audit, in accordance with the requirements in 4.1.3 and 4.1.4 of Pt 7, Ch 11 of the Rules, is to be undertaken by LR to confirm that the necessary Environmental Protection procedures are in place and implemented effectively.

3.12 Descriptive notes

3.12.1 In addition to any class notations, an appropriate descriptive note may be entered in column 6 of the appropriate *Register Book* indicating the type of craft in greater detail than is contained in the class notation, and/or providing additional information about the craft's design and construction. This descriptive note is not a LR classification notation and is provided solely for the information of users of the *Register Book*.

3.12.2 The descriptive note **SCM** (Screwshaft Condition Monitoring) may be assigned when oil lubricated screwshaft arrangements with approved oil glands are fitted and the requirements of Ch 3,11.3 or Ch 4,10.3 are complied with.

■ *Section 4*
Surveys – General

4.1 Statutory surveys

4.1.1 The Committee will act, when authorised on behalf of Governments, in respect of National and International statutory safety and other requirements.

4.1.2 The Committee will also act, when authorised, in respect of National safety and other requirements relating to craft used for offshore mineral exploration and exploitation.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.2 New construction surveys

4.2.1 When it is intended to build a craft for classification with LR, constructional plans and all particulars relevant to the hull, equipment and machinery, as detailed in the Rules, are to be submitted for the approval of the Committee before the work is commenced. Any subsequent modifications or additions to the scantlings, arrangements or equipment shown on the approved plans are also to be submitted for approval.

4.2.2 Where the proposed construction of any part of the hull or machinery is of novel design, or involves the use of unusual material, or where experience, in the opinion of the Committee, has not sufficiently justified the principle or mode of application involved, special tests or examinations before and during service may be required. In such cases a suitable notation may be entered in the appropriate *Register Book*.

4.2.3 The materials used in the construction of hulls and machinery intended for classification are to be of good quality and free from defects and are to comply with the requirements of the Rules.

4.2.4 The Surveyor is to be satisfied that the capability, organisation and facilities of the Builder are such that acceptable standards can be obtained both for the construction of the craft and the installation of machinery, electrical and control equipment.

4.2.5 In addition to 4.2.4, the hull construction of craft manufactured from composite materials is to be controlled by a documented quality control system covering the Builder's management, organisation and relevant construction processes and inspection procedures, *see* Pt 8, Ch 2.

4.2.6 New craft intended for classification are to be built under LR's Special Survey. The Surveyors are to be satisfied that the materials, workmanship and arrangements are in accordance with the Rules. Any items found not to be in accordance with the Rules or the approved plans, or any material, workmanship or arrangements found to be so, are to be rectified.

4.2.7 For compliance with 4.2.6 LR is prepared to consider methods of survey and inspection for hull construction which formally include procedures involving the shipyard management, organisation and quality systems as defined in Chapter 2 of Parts 6, 7 and 8 for steel, aluminium alloy and composite construction respectively.

4.2.8 Copies of approved plans (showing the craft as built), essential certificates and records, required loading and other instruction manuals are to be readily available for use when required by LR's Surveyors and may be required to be kept on board.

4.2.9 After completion, the craft is to be examined afloat, and trials are to be conducted as specified in the Rules.

4.2.10 When the machinery is constructed under LR's Special Survey, this survey is to relate to the period from the commencement of the work until the final test under working conditions. Any items found not to be in accordance with the Rules or the approved plans, or any material, workmanship or arrangements found to be unsatisfactory, are to be rectified.

4.2.11 When arrangements are such that essential machinery can be operated by remote and/or automatic control equipment, the control equipment is to be arranged, installed and tested in accordance with the Rules, as applicable.

4.2.12 The date of completion of the Special Survey during construction of craft built under LR's inspection will normally be taken as the date of build to be entered in the appropriate *Register Book*. If the period between launching and commissioning is, for any reason, unduly prolonged, the dates of launching and completion or commissioning may be separately indicated in the appropriate *Register Book*.

4.2.13 When a craft, upon completion, is not immediately commissioned but is laid-up for a period, the Committee, upon application by the Owner, prior to the craft proceeding to sea, will direct an examination to be made by LR's Surveyors which may include a survey in dry-dock. If, as the result of such survey, the hull and machinery be reported in all respects free from deterioration, the subsequent Special Survey and Complete Survey of the machinery will date from the time of such examination.

4.3 Existing craft

4.3.1 **Classification of craft not built under survey.** The requirements of the Committee for the classification of craft which have not been built under LR's Survey are indicated in Ch 3,12 or Ch 4,12 as applicable. Special consideration will be given to craft transferring class to LR from another recognised Classification Society.

4.3.2 **Reclassification.** When reclassification or class reinstatement is desired for a craft for which the class previously assigned by LR has been withdrawn or suspended, the Committee will direct that a survey, appropriate to the age of the craft and the circumstances of the case, be carried out by LR's Surveyors. If, at such survey, the craft be found or placed in a good and efficient condition in accordance with the requirements of the Rules, the Committee will be prepared to consider reinstatement of the original class or the assignment of such other class as may be deemed necessary.

4.3.3 In the case of existing yachts over 15 years of age, the requirements for classification of craft not built under survey or for reclassification will be specially considered.

4.3.4 The Committee reserves the right to decline an application for classification or reclassification where the prior history or condition of the craft indicates this to be appropriate.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.4 Damages, repairs and alterations

4.4.1 All repairs to hull, equipment and machinery which may be required in order that a craft may retain her class, *see* 1.1.7, are to be carried out to the satisfaction of LR's Surveyors. When repairs are effected at a port, terminal or location where the services of a Surveyor to LR are not available, the repairs are to be surveyed by one of LR's Surveyors at the earliest opportunity thereafter.

4.4.2 When at any survey the Surveyors consider repairs to be immediately necessary, either as a result of damage, or wear and tear, they are to communicate their recommendations at once to the Owner, or his representative. When such recommendations are not complied with, immediate notification is to be given to the Committee by the Surveyors.

4.4.3 Where repairs are to be carried out by a riding crew during a voyage then these must be planned in advance. A complete repair procedure, including the extent of proposed repair and the need for Surveyor's attendance during the voyage, is to be submitted reasonably in advance to the Surveyor for agreement. Failure to notify LR in advance of the repairs may result in the class of the ship being specially considered by the Classification Committee. Where emergency repairs are effected immediately due to an emergency circumstance, the repairs should be documented in the ship's log and submitted thereafter to LR for use in determining further survey requirements.

4.4.4 When at any survey it is found that any damage, defect, or breakdown (*see* 1.1.7) is of such a nature that it does not require immediate permanent repair, but is sufficiently serious to require rectification by a prescribed date in order to maintain class, a suitable condition of class is to be imposed by the Surveyors and recommended to the Committee for consideration.

4.4.5 If a craft which is classed with LR is to leave harbour limits or protected waters under tow, the Owner is to advise LR of the circumstances prior to her departure.

4.4.6 If a craft which is classed with LR is taken in tow whilst at sea, the Owner is to advise LR of the circumstances at the first practicable opportunity.

4.4.7 Plans and particulars of any proposed alterations to the approved scantlings and arrangements of hull, equipment, or machinery are to be submitted for approval by Owners or Builders or their representatives and such alterations are to be carried out to the satisfaction of LR's Surveyors.

4.4.8 The Owners should notify LR whenever a craft can be examined in dry-dock or on a slipway.

4.5 Existing service craft and yachts – Periodical Surveys

4.5.1 Service craft are to be submitted to the periodical survey requirements as defined in Chapter 3.

4.5.2 Yachts are to be submitted to the periodical survey requirements defined in Chapter 4, except in the case where LR issues Statutory Loadline SAFCON certification or Certificate of Compliance to 'Code of Practice' as a requirement of the National Authority of the country in which the yacht is registered. In these cases they are to be submitted to the periodical survey requirements as defined in Chapter 3.

4.5.3 Annual Surveys are to be held on all craft other than yachts within three months, before or after each anniversary of the completion, commissioning or Special Survey. The date of the last Annual Survey will be recorded on the ClassDirect Live website.

4.5.4 Intermediate Surveys are to be held on all craft other than yachts instead of the second or third Annual Survey after completion, commissioning or Special Survey. The date of the last Intermediate Survey will be recorded on the ClassDirect Live website.

4.5.5 Intermediate Surveys are to be held on yachts between the second and third anniversary after completion, commissioning or Special Survey.

4.5.6 The Owner should notify the Surveyors whenever a craft can be examined in dry-dock or on a slipway. A minimum of two Docking Surveys are to be held in each five-year Special Survey period and the maximum interval between successive Docking Surveys is not to exceed three years. One of the two Docking Surveys required in each five year period is to coincide with the Special Survey. Consideration may be given at the discretion of the Committee to any special circumstances justifying an extension of this interval and the Committee may accept an In-water Survey in lieu of the intermediate docking between Special Surveys, *see* Ch 3,4.3 and Ch 4,3.3. A Docking Survey is considered to coincide with the Special Survey when held within the 15 months prior to the due date of the Special Survey.

4.5.7 The interval between dry-dockings for craft operating in fresh water and for certain non self-propelled craft may at the discretion of the Committee, be greater than that given in 4.5.6.

4.5.8 Attention is to be given to any relevant statutory requirements of the National Authority of the country in which the craft is registered.

4.5.9 The date of the last examination in dry-dock or on a slipway will be recorded on the ClassDirect Live website.

4.5.10 Survey requirements for In-water Surveys are given in Ch 3,4.3 and Ch 4,3.3 as appropriate. The date of the last In-water Survey will be recorded on the ClassDirect Live website.

4.5.11 All craft classed with LR are also to be subjected to Special Surveys. These Surveys become due at five-yearly intervals, the first one five years from the date of build or date of Special Survey for Classification as recorded in the appropriate *Register Book*, and thereafter five years from the date recorded for the previous Special Survey. Consideration can be given at the discretion of the Committee to any exceptional circumstances justifying an extension of the hull

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

classification to a maximum of three months beyond the fifth year. If an extension is agreed the next period of hull classification will start from the due date of the Special Survey before the extension was granted.

4.5.12 Special surveys may be commenced at the fourth Annual Survey or fourth anniversary, as appropriate, after completion, commissioning, or previous Special Survey, and be progressed during the succeeding year with a view to completion by the due date of the Special Survey.

4.5.13 Special Surveys which are commenced prior to their due date are not to extend over a period greater than 15 months, except with the prior approval of the Committee.

4.5.14 Craft which have satisfactorily passed a Special Survey will have a record entered indicating the date. Where the Special Survey is completed more than three months before the due date, the new record of Special Survey will be the final date of survey. In all other cases the date recorded will be the fifth anniversary. In the case of yachts this information will be recorded on the ClassDirect Live website.

4.5.15 At the request of an Owner, the Committee may agree that the Special Survey of the hull be carried out on the Continuous Survey basis, all compartments of the hull being opened for survey and testing, in rotation, with an interval of five years between consecutive examinations of each part. In general, approximately one fifth of the Special Survey is to be completed each year and all the requirements of the particular hull Special Survey must be completed at the end of the five year cycle. If the examination during Continuous Survey reveals any defects, further parts are to be opened up and examined as considered necessary by the Surveyor. For examination of items listed in Ch 3,2.2.17, 2.2.18, 3.2.2, 3.2.3, 3.2.4 or Ch 4,2.2.11, 2.2.12, 2.2.13 as applicable, the intervals for inspection will require to be specially agreed. Craft which have satisfactorily completed the cycle will have a record entered in the *Register Book* indicating the date of completion which will not be later than five years from the last assigned date of Complete Survey of the hull. The agreement for surveys to be carried out on Continuous Survey basis may be withdrawn at the discretion of the Committee.

4.5.16 Complete Surveys of machinery become due at five yearly intervals, the first one five years from the date of build or date of first classification as recorded in the appropriate *Register Book*, and thereafter five years from the date recorded for the previous Complete Survey. Consideration can be given at the discretion of the Committee to any exceptional circumstances justifying an extension of machinery class to a maximum of three months beyond the fifth year. If an extension is agreed to, the next period of machinery class will start from the due date of Complete Survey of machinery before extension was granted. Surveys which are commenced prior to their due date are not to extend over a period greater than 15 months, except with the prior approval of the Committee. Where the complete survey is completed more than three months before the due date, the recorded date of completion will be the final date of survey. In all other cases the date recorded will be the fifth anniversary.

4.5.17 Upon application by an Owner, the Committee may agree to the extension of the survey requirements for main engines, which, by the nature of the craft's normal service, do not attain the number of running hours recommended by the engines' manufacturer for major overhauls within the survey periods given in 4.5.16.

4.5.18 If it is found desirable that any part of the machinery should be examined again before the due date of the next survey, a certificate for a limited period will be granted in accordance with the nature of the case.

4.5.19 When, at the request of an Owner, it has been agreed by the Committee that the Complete Survey of the machinery may be carried out on the Continuous Survey basis, the various items of machinery are to be opened for survey in rotation, so far as is practicable, to ensure that the interval between consecutive examinations of each item will not exceed five years. In general, approximately one-fifth of the machinery is to be examined each year.

4.5.20 If any examination during Continuous Survey reveals defects, further parts are to be opened up and examined as considered necessary by the Surveyor, and the defects are to be made good to his satisfaction.

4.5.21 Upon application by an Owner, The Committee may agree to an arrangement whereby, subject to certain conditions, some items of machinery may be examined by the Chief Engineer of the craft at ports where LR is not represented, or, where practicable, at sea, followed by a limited confirmatory survey carried out at the next port of call where an Exclusive Surveyor is available. Particulars of this arrangement may be obtained from LR's Headquarters.

4.5.22 Where an approved planned maintenance scheme is in operation the confirmatory surveys of machinery as required by 4.5.21 may be held at annual intervals, at which time the records will be checked and the operation of the scheme verified. Particulars of this arrangement may be obtained from any of LR's Offices.

4.5.23 Where condition monitoring equipment is fitted, the Committee, upon application by the Owner, will be prepared to amend applicable Periodical Survey requirements where details of the equipment are submitted and found satisfactory. Where machinery installations are accepted for this method of survey, it will be a requirement that an Annual Survey be held, at which time monitored records will be analysed and the machinery examined under working conditions. An acceptable lubricating oil trend analysis programme may be required as part of the condition monitoring procedures.

4.5.24 Screwshaft and Waterjet Unit Surveys are to be carried out as stated in Ch 3,11 for service craft and Ch 4,10 for yachts.

4.5.25 Boiler surveys and steam pipe surveys, where applicable are to be carried out as stated in accordance with Pt 1, Ch 3,15 and 16 of the Rules for Ships.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.5.26 Craft of unusual design, type or arrangement may be subject to exceptional survey requirements. Such survey requirements will be detailed at the assignment of classification.

4.5.27 Where the Committee has agreed to an Owner's request to assign the notation 'laid-up', the vessel may be retained in class provided a satisfactory general examination of the hull and machinery is carried out at the Annual Survey/Intermediate Survey due date and in addition an Underwater Examination (UWE) is carried out at the Special Survey due date. The general examination may be carried out within three months before or after the Annual Survey due date.

4.6 Existing amphibious air cushion vehicles – Periodical Surveys

4.6.1 Amphibious Air Cushion Vehicles are to be submitted to the periodical survey requirements as defined in Chapter 5.

4.7 Certificates

4.7.1 When the required reports, on completion of the survey of new or existing craft which have been submitted for classification, have been received from the Surveyors and approved by the Committee, a certificate of First Entry of Classification, signed by the Chairman, or the Deputy Chairman and Chairman of the Sub-Committee of Classification, will be issued to Builders or Owners.

4.7.2 A Certificate of Class valid for five years subject to endorsement for Annual and/or Intermediate Surveys, as appropriate, will also be issued to the Owners.

4.7.3 LR's Surveyors are permitted to issue provisional (interim) certificates to enable a craft classed with LR to proceed on her voyage provided that in their opinion it is in a fit and efficient condition. Such certificates will embody the Surveyors' recommendations for continuance of class, but in all cases are subject to confirmation by the Committee.

4.8 Notice of surveys

4.8.1 It is the responsibility of the Owners to ensure that all surveys necessary for the maintenance of class are carried out at the proper time and in accordance with the instructions of the Committee. Information is available to Owners on the ClassDirect Live website.

4.8.2 LR will give timely notice to an Owner about forthcoming surveys by means of a letter or a computer print-out of a craft's *Quarterly Listing of Surveys, Conditions of Class and Memoranda*. The omission of such notice, however, does not absolve the Owner from his responsibility to comply with LR's survey requirements for maintenance of class, all of which are available to Owners on the ClassDirect Live website.

4.9 Withdrawal/Suspension of class

4.9.1 When the class of a craft, for which the Regulation as regards surveys on hull, equipment and machinery have been complied with, is withdrawn by the Committee in consequence of a request from the Owner the notation 'Class withdrawn at Owner's request' (with date) will be assigned.

4.9.2 When the Regulations as regards surveys on the hull, equipment or machinery have not been complied with and the craft is thereby not entitled to retain class, the class will be suspended or withdrawn, at the discretion of the Committee, and a corresponding notation will be assigned.

4.9.3 Class will be automatically suspended and the Certificate of Class will become invalid if the Annual or Intermediate Survey, as appropriate, is not completed within three months of the due date of the survey.

4.9.4 Class will be automatically suspended from the expiry date of the Certificate of Class in the event that the Special Survey has not been completed by the due date and an extension has not been agreed (*see* 4.5.11), or is not under attendance by the Surveyors with a view to completion prior to resuming trading.

4.9.5 When in accordance with 4.4.4 a condition of class is imposed, this will be assigned a due date for completion and the craft's class will be subject to a suspension procedure if the condition of class is not dealt with, or postponed by agreement, by the due date.

4.9.6 When it is found, from the reported condition of the hull or equipment or machinery of a craft, that an Owner has failed to comply with Regulations 1.1.7, 1.1.11, 4.4.1 or 4.4.6 above, the class will be liable to be suspended or withdrawn, at the discretion of the Committee, and a corresponding notation assigned. When it is considered that an Owner's failure to comply with these requirements is sufficiently serious the suspension or withdrawal of class may be extended to include other craft controlled by the same Owner, at the discretion of the Committee.

4.9.7 When any craft proceeds to sea with less freeboard than that approved by the Committee, or when the freeboard marks are placed higher on the sides of the craft than the position assigned or approved by the Committee, or, in cases of craft where freeboards are not assigned, the draught is greater than that approved by the Committee, the class will be liable to be withdrawn or suspended.

4.9.8 When it is found that a craft is being operated in a manner contrary to that agreed at the time of classification, i.e. out with the parameters of the operational envelope, the class will be liable to be automatically withdrawn or suspended.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.9.9 In all instances of class withdrawal or suspension, the assigned notation, with date of application, will appear in the *Register Book*. In cases where class has been suspended by the Committee and it becomes apparent that the Owners are no longer interested in retaining LR's class, the notation will be amended to withdrawn status. After class withdrawn status has been established in the appropriate *Register Book* for one year, it will be automatically amended to 'classed LR until' (with date). In the case of yachts this information will be recorded on the ClassDirect Live website.

4.9.10 For reclassification and reinstatement of class, *see* 4.3.2 and 4.3.3.

4.10 Survey of craft out of commission

4.10.1 The classification requirements for laid up vessels will be specially considered. Surveys for continuation of class may be required at the discretion of the Committee.

4.11 Appeal from Surveyors' recommendations

4.11.1 If the recommendations of LR's Surveyors are considered in any case to be unnecessary or unreasonable, appeal may be made to the Committee, who may direct a Special Examination to be held.

■ *Section 5* IACS QSCS Audits

5.1 Audit of Surveys

5.1.1 The surveys required by the Regulations may be subject to audit in accordance with the requirements of the International Association of Classification Societies Quality System Certification Scheme.

■ *Section 6* Type Approval/Type testing/ Quality control system

6.1 LR Type Approval – Marine Applications

6.1.1 LR Type Approval is an impartial certification system that provides independent third-party Type Approval Certificates attesting to a product's conformity with specific standards or specifications. It is based on design review and type testing or where testing is not appropriate, a design analysis.

6.1.2 The LR Type Approval System is a process whereby a product is assessed in accordance with a specification, standard or code to check that it meets the stated requirements and through selective testing demonstrates compliance with specific performance requirements. The testing is carried out on a prototype or randomly selected product(s) which are representative of the manufactured product under approval. Thereafter, the producer is required to use Quality Control procedures and processes to ensure that each item delivered is in conformity with that which has been Type Tested.

6.1.3 The selective testing required by 6.1.2 is to include environmental testing applicable to the product's installation on board a craft or yacht classed or intended to be classed with LR.

6.1.4 LR Type Approval does not remove the requirements for inspection and survey procedures required by the Rules for equipment to be installed in craft/yachts classed or intended to be classed with LR. Also, LR Type Approval does not remove the requirement for plan appraisal of a system that incorporates Type Approved equipment where required by the Rules.

6.1.5 LR Type Approval is subject to the understanding that the producer's recommendations and instructions for the product and any relevant requirements of the Rules for the Classification of Special Service Craft are fulfilled.

6.1.6 The producer supplying equipment or components under Quality Control procedures and processes is to have a recognised quality management system certified by an IACS member or Notified Body. The Quality Control procedures and processes are to address the production of the product consistent with 6.3.

6.1.7 Where equipment or components have been Type Approved in accordance with specifications and procedures other than LR's, details of the product, certification and testing are to be submitted for consideration where appropriate.

6.2 Type testing

6.2.1 Type testing is an impartial process that provides independent third-party verification that an item of machinery or equipment has satisfactorily undergone a functional type test.

6.2.2 Type testing is carried out against defined performance and test standards for a defined period of time with test conditions varying between minimum and maximum declared design conditions.

6.2.3 Type testing is carried out on a prototype or randomly selected product(s) which are representative of the manufactured product under assessment.

6.2.4 After type testing, mechanical equipment is to be opened out and inspected for damage or excessive wear.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

6.2.5 On application from the manufacturer, type tests may be waived for equipment and machinery that has been proven to be reliable in marine service and where compliance with the current applicable standards can be demonstrated. Equipment and machinery that has been previously type tested with satisfactory testing evidence and certification need not have the type tests repeated where previous testing is in compliance with the current testing standards.

6.2.6 The acceptance of type testing certification is subject to the understanding that the manufacturer's recommendations and instructions for the product and any relevant requirements of the applicable Rules are fulfilled.

6.3 Quality control system

6.3.1 A quality control system for the purposes of LR acceptance of materials and machinery refers to a scheme that covers the operational techniques and activities that is used to demonstrate that the quality requirements for a product are in accordance with declared standards.

6.3.2 The quality control system for a particular product extends to all parties involved in the supply chain from manufacture and testing through to delivery of the product.

6.3.3 LR acceptance of machinery and equipment manufactured under a quality control scheme is dependent on the scheme being maintained through a traceable process involving planned audits and spot inspections at the discretion of LR Surveyors. The purpose of the audits and spot inspections is to ensure that the procedures for manufacture and quality control are being maintained in a satisfactory manner.

6.3.4 The use of a quality control system does not remove the requirements for inspection processes that may be required by the Rules applicable to the equipment being supplied with a manufacturer's certificate. Also the use of a quality control system does not remove the requirement for plan appraisal of equipment or systems where required by the Rules.

■ *Section 7*
Classification of machinery for craft/yachts with [✠]LMC or MCH notation

7.1 General

7.1.1 After delivery of machinery and equipment with the manufacturer's certificate to the build yard, Survey at the build yard and Periodical Surveys are to be in accordance with the requirements for craft/yacht built or accepted into class with the ✠**LMC** notation.

7.2 Appraisal and records

7.2.1 To facilitate survey and compilation of classification records, plans and information required for a craft/yacht being accepted into class with the ✠**LMC** notation are to be submitted for appraisal and information. Plans are not required where machinery and equipment has previously been type approved; in these cases it is only necessary to submit details of the machinery and equipment together with details of the previous approval.

7.3 Survey and inspection

7.3.1 The manufacturer's certificate for acceptance of machinery and equipment for assignment of the **[✠]LMC** or **MCH** notation is to be in the English language and include the following information:

(a) Design and manufacturing standard(s) used.
(b) Materials used for construction of key components and their sources.
(c) Details of the quality control system applied during design, manufacture and testing and any software maintenance.
(d) Details of any type approval or type testing.
(e) Details of installation and testing recommendations for the machinery or equipment.

The manufacturer is to have a recognised quality management system certified by an IACS member or a Notified Body.

7.3.2 The installation and testing of machinery and equipment at the build yard which has been supplied with a manufacturer's certificate is to be in accordance with the requirements applicable to a craft/yacht having the ✠**LMC** notation.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Section

1 **General**

2 **Annual Surveys – Hull and machinery requirements**

3 **Intermediate Surveys – Hull and machinery requirements**

4 **Docking Surveys and In-water Surveys – Hull and machinery requirements**

5 **Special Survey – General – Hull requirements**

6 **Special Survey – Thickness measurement requirements for steel craft**

7 **Machinery surveys – General requirements**

8 **Gas turbines – Detailed requirements**

9 **Oil engines – Detailed requirements**

10 **Electrical equipment**

11 **Screwshafts, tube shafts, propellers and water jet units**

12 **Classification of craft not built under survey**

Section 1 General

1.1 Frequency of surveys

1.1.1 The requirements of this Chapter are applicable to the Periodical Surveys set out in Ch 2,4.5. Except as amended at the discretion of the Committee, the periods between such surveys are as follows:

(a) Annual Surveys, as required by Ch 2,4.5.3.
(b) Intermediate Surveys as required by Ch 2,4.5.4.
(c) Docking Surveys as required by Ch 2,4.5.6 and 4.5.7.
(d) Special Surveys at five-yearly intervals, *see* Ch 2,4.5.11. For alternative arrangements, *see also* Ch 2,4.5.12, 4.5.13 and 4.5.15.
(e) Complete Surveys of machinery at five-yearly intervals, *see* Ch 2,4.5.16. For alternative arrangements, *see also* Ch 2,4.5.17, 4.5.19, 4.5.21, 4.5.22 and 4.5.23.

1.1.2 For vessels assigned the notation 'laid-up', in order to maintain the vessel in class a general examination of the hull and machinery is to be carried out in lieu of the Annual Survey/Intermediate Survey and in addition an Underwater Examination (UWE) is to be carried out in lieu of the Special Survey, *see* 2.1.3, 5.1.4 and 7.1.3.

1.1.3 When it has been agreed that the complete survey of the hull and machinery may be carried out on the Continuous Survey basis, all compartments of the hull and all items of machinery are to opened for survey in rotation to ensure that the interval between consecutive examinations of each part will not exceed five years, *see* Ch 2,4.5.15 and 4.5.19.

1.1.4 For the frequency of surveys of screwshafts, tube shafts propellers and water jet units, *see* Section 11.

1.2 Surveys for damage or alterations

1.2.1 At any time when a craft is undergoing alterations or damage repairs, any exposed parts of the structure normally difficult to access are to be specially examined, e.g. if any part of the main or auxiliary machinery is removed for any reason, the hull structure in way is to be carefully examined by the Surveyor, or when cement in the bottom or sheathing on decks is removed, the structure in way is to be examined before the cement or sheathing is relaid.

1.3 Unscheduled surveys

1.3.1 In the event that Lloyd's Register (hereinafter referred to 'LR') has cause to believe that its Rules and Regulations are not being complied with, LR reserves the right to perform unscheduled surveys of the hull or machinery.

1.3.2 In the event of significant damage or defect affecting any craft, LR reserves the right to perform unscheduled surveys of the hull or machinery of other similar craft classed by LR and deemed to be vulnerable.

1.4 Surveys for the issue of Convention certificates

1.4.1 Surveys are to be held by LR when so appointed, or by the Exclusive Surveyors to a National Administration or by an IACS Member when so authorised by the National Authority, or, in the case of Cargo Ship Safety Radio Certificates or Safety Management Certificates, by any organisation authorised by the National Authority. In the case of dual classed craft, Convention Certificates may be issued by the other Society with which the craft is classed provided this is recognised in a formal Dual Class Agreement with LR and provided the other Society is also authorised by the National Authority.

1.5 Definitions

1.5.1 **A Ballast tank** is a tank which is used solely for salt water ballast. A tank which is used for both cargo and salt water ballast will be treated as a salt water ballast tank when substantial corrosion has been found in that tank.

1.5.2 **Spaces** are separate hull compartments including integral tanks.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.5.3 **Suspect areas** are locations within the hull structure vulnerable to increased likelihood of structural deterioration and may include:

(a) For steel hulls, areas of substantial corrosion and/or fatigue cracking.
(b) For aluminium alloy hulls, areas of fatigue cracking and areas in the vicinity of bimetallic connections.
(c) For composite hulls, areas subject to impact damage.
(d) For high speed craft (as defined in Ch 2,2.2.7), areas of the bottom structure forward prone to slamming damage.

1.5.4 **Substantial corrosion** is wastage of individual steel or aluminium plates and stiffeners in excess of 75 per cent of allowable margins, but within acceptable limits.

1.5.5 **Protective coatings** for steel craft should usually be hard coatings. Other coating systems (e.g. soft coating) may be considered acceptable as alternatives provided they are applied and properly maintained in compliance with the manufacturer's specification.

1.5.6 **Coating condition** for steel craft is defined as follows:

GOOD condition with only minor spot rusting affecting not more than 20 per cent of areas under consideration.

Section 2
Annual Surveys – Hull and machinery requirements

2.1 General

2.1.1 Annual Surveys are to be held concurrently with any relevant statutory annual or other statutory surveys, wherever practicable.

2.1.2 At Annual Surveys, the Surveyor is to examine the hull and machinery, so far as necessary and practicable, in order to be satisfied as to their general condition.

2.1.3 For vessels assigned the notation 'laid-up', in lieu of the normal Annual Survey requirements a general examination of the hull and machinery is to be carried out.

2.2 Annual Surveys

2.2.1 The Surveyor is to be satisfied regarding:

(a) The efficient condition of hatchways on freeboard and superstructure decks, weather deck plating, ventilator coamings and air pipes, exposed casings, skylights, flush deck scuttles, deckhouses and companionways, superstructure bulkheads, side, bow and stern doors, windows and storm shutters, side scuttles and dead-lights, chutes and other openings, together with all closing appliances and flame screens.
(b) The efficient operating condition of mechanically operated hatch covers including stowage, fit, securing, locking, sealing and operational testing of hydraulic power components, wires, chains, etc.
(c) The efficient condition of scuppers and sanitary discharges (so far as is practicable); valves on discharge lines (so far as is practicable) and their controls; guard rails and bulwarks; freeing ports, gangways and life-lines; fittings and appliances for timber deck cargoes.
(d) The efficient condition of bilge level detection and alarm systems on craft assigned a **UMS** notation.

2.2.2 Any cargo hatch covers and coamings together with any cargo doors or ramps which form part of the watertight integrity of the hull are to be examined to ensure that no alterations have been made to the approved arrangements.

(a) Mechanically operated cargo hatch covers or doors are to be tested for tightness and to confirm the satisfactory condition of securing and sealing arrangements; drainage channels; operating mechanisms; tracks and wheels.
(b) Cargo hatch covers of the portable type are to be examined to confirm that the covers and closing appliances are in a satisfactory condition.

2.2.3 The anchoring and mooring equipment including anchor warps or wire ropes is to be examined so far as is practicable.

2.2.4 The watertight doors in watertight bulkheads, their indicators and alarms are to be examined and operationally tested locally and where applicable remotely. Other watertight bulkhead penetrations, are to be examined so far as is practicable.

2.2.5 The Surveyor is to examine and test in operation all main and auxiliary steering arrangements including their associated equipment and control systems, and verify that log book entries have been made in accordance with statutory requirements where applicable.

2.2.6 Where applicable, the Surveyor is to be satisfied regarding the freeboard marks on the craft's side.

2.2.7 The Surveyor is to generally inspect the machinery spaces with particular attention being given to the propulsion system, auxiliary machinery and to the existence of any fire and explosion hazards. Where applicable, emergency escape routes are to be checked to ensure that they are free of obstruction.

2.2.8 The means of communication between the navigating bridge and the machinery control positions, as well as the bridge and the alternative steering position, if fitted, are to be tested.

2.2.9 The bilge pumping systems and bilge wells, including operation of extended spindles, self closing drain cocks and level alarms, where fitted, are to be examined so far as is practicable. Satisfactory operation of the bilge pumps, including any hand pumps, is to be proven.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2.2.10 The boilers, other pressure vessels and their appurtenances, including foundations, controls, high pressure and waste steam piping, and insulation and gauges, are to be generally examined. Surveyors should confirm that Periodical Surveys of boilers and other pressure vessels have been carried out as required by the Rules.

2.2.11 For boilers, the safety devices are to be tested, and the safety valves are to be operated using the relieving devices. For exhaust gas heated economisers/boilers, the safety valves are to be tested at sea by the Chief Engineer and details recorded in the log book.

2.2.12 The operation and maintenance records, repair history and feed water chemistry records of boilers are to be examined.

2.2.13 For other pressure vessels, the safety devices are to be examined.

2.2.14 The electrical equipment and cabling forming the main and emergency electrical installations are to be generally examined under operating conditions so far as is practicable. The satisfactory operation of the main and emergency sources of power and electrical services essential for safety in an emergency is to be verified; where the sources of power are automatically controlled they should be tested in the automatic mode. Bonding straps for the control of static electricity and earthing arrangements are to be examined where fitted.

2.2.15 For main propulsion, essential auxiliary and emergency machinery control engineering systems, a general examination of the equipment and arrangements is to be carried out. Records of modifications are to be made available for review by the attending Surveyor. The documentation required by Pt 6, Ch 1, including configuration management, are to be reviewed following system modifications. Satisfactory operation of the safety devices and control systems is to be verified. For craft having **UMS** or **CCS** notation, a general examination of the control engineering equipment required for these notations is also to be carried out.

2.2.16 For craft fitted with an electronically controlled engine for main propulsion, essential auxiliary or emergency power purposes, the following is to be carried out to the satisfaction of the Surveyor:

(a) Verification of evidence of satisfactory operation of the engine and, where possible, this is to include a running test under load;
(b) Verification of satisfactory operation of the safety devices and control, alarm and monitoring systems; and
(c) Verification that any changes to the software or control, alarm, monitoring and safety systems that affect the operation of the engine have been assessed by LR and are under configuration management control.

2.2.17 For craft to which Pt 17, Ch 1 applies, the arrangements for fire protection, detection and extinction are to be examined and are to include the following items, as required to be fitted in accordance with the Rules:

(a) Verification, so far as is practicable, that no significant changes have been made to the arrangement of structural fire protection.
(b) Verification of the operation of manual and/or automatic doors where fitted.
(c) Verification that fire control plans are properly posted;
(d) Examination, so far as is possible, and testing as feasible, of the fire and/or smoke detection and alarm system(s).
(e) Examination of fire main system, and confirmation that each fire pump, including the emergency fire pump can be operated separately so that the required jets of water can be produced simultaneously from different hydrants.
(f) Verification that fire-hoses, nozzles, applicators and spanners are in good working condition and situated at their respective locations.
(g) Examination of fixed fire-fighting systems controls, piping, instructions and marking, checking for evidence of proper maintenance and servicing, including date of last systems tests.
(h) Verification that all portable and semi-portable fire-extinguishers are in their stowed positions, checking for evidence of proper maintenance and servicing, conducting random checks for evidence of discharged containers.
(j) Verification, so far as is practicable, that the remote control for stopping fans and machinery and shutting off fuel supplies in machinery spaces and, where fitted, the remote controls for stopping fans in accommodation spaces and the means of cutting off power to the galley are in good working order.
(k) Examination of the closing arrangements of ventilators, skylights and doorways where applicable.
(l) Verification that the fireman's outfits are complete and in good condition.
(m) Verification that gas installations for domestic purposes comply with the relevant statutory requirements.

2.2.18 For steel craft, the requirements of 3.2.2 and 5.4.2 regarding the survey of water ballast spaces, integral sanitary tanks and bilges are also to be complied with as applicable.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Section 3
Intermediate Surveys – Hull and machinery requirements

3.1 General

3.1.1 Intermediate Surveys are to be held concurrently with statutory annual or other relevant statutory surveys wherever practicable.

3.2 Intermediate Surveys

3.2.1 The requirements of Section 2 are to be complied with so far as applicable.

3.2.2 For steel craft a general examination of salt water ballast tanks, integral sanitary tanks and bilges is to be carried out as required below. If such inspections reveal no visible structural defects then the examination may be limited to a verification that the protective coating remains in GOOD condition as defined in 1.5.6. When considered necessary by the Surveyor thickness measurement of the structure is to be carried out. Where the protective coating is found to be other than in GOOD condition, and it has not been repaired, maintenance of class will be subject to the spaces in question being internally examined and gauged as necessary at Annual Surveys.

(a) For all craft over five years of age and up to 10 years of age, representative salt water ballast tanks, integral sanitary tanks and bilges are to be generally examined. Where the protective coating is found to be other than in GOOD condition, as defined in 1.5.6, or other defects are found, the examination is to be extended to other spaces of the same type.

(b) For steel craft over 10 years of age all salt water ballast tanks, integral sanitary tanks and bilges are to be generally examined.

3.2.3 For all craft over 10 years of age the anchors are to be partially lowered and raised using the windlass.

3.2.4 The electrical generating sets are to be examined under working conditions.

3.2.5 Representative internal spaces including fore and aft peak spaces, machinery spaces, bilges, etc., are to be generally examined. These spaces should include all suspect areas, *see* 1.5.3.

Section 4
Docking Surveys and In-water Surveys – Hull and machinery requirements

4.1 General

4.1.1 At Docking Surveys or In-water Surveys the Surveyor is to examine the craft and machinery, so far as necessary and practicable, in order to be satisfied as to the general condition.

4.2 Docking Surveys

4.2.1 Where a craft is in dry-dock or on a slipway it is to be placed on blocks of sufficient height and proper staging is to be erected as may be necessary, for the examination of the outside of the hull, rudder(s) and underwater fittings. The outside surface of the hull is to be cleaned as may be required by the Surveyor.

4.2.2 Attention is to be given to parts of the external hull structure particularly liable to structural deterioration from causes such as high stresses, chafing and lying on the ground, and to areas of structural discontinuity.

4.2.3 The following parts of the external hull structure are to be specially examined:

(a) For steel hulls attention is to be given to parts of the structure particularly liable to excessive corrosion and to any undue unfairness of the plating of the bottom. The coating system is to be examined and made good as necessary.

(b) For aluminium alloy hulls attention is to be given to areas adjacent to any bimetallic connections at skin fittings, etc.

(c) For composite hulls the gelcoat or other protective finish is to be examined for surface cracking, blistering or other damage which may impair the efficiency of the protection to the underlying laminate.

4.2.4 Where required by the Rules, the satisfactory condition of the cathodic protection is to be confirmed.

4.2.5 The clearances in the rudder bearings and pintles are to be measured. Where considered necessary by the Surveyor rudders are to be lifted for examination of the stock. The securing of rudder couplings and/or pintle fastenings is to be confirmed.

4.2.6 The sea connections and overboard discharge valves, their attachments to the hull and the gratings at the sea inlets are to be examined.

4.2.7 The propeller and fastenings are to be examined. The sternbush is to be examined as far as is practicable.

4.2.8 The clearance in the sternbush or the efficiency of the oil glands is to be ascertained. The clearance of any shaft bracket bearings is to be ascertained.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.2.9 The inboard shaft seals or glands are to be examined. Where flexible sternglands are fitted, the satisfactory condition of the rubber hose and securing clips is to be confirmed.

4.2.10 Special attention is to be given to the hull in way of underwater fittings such as transverse thrusters, stabilisers, etc.

4.2.11 Where applicable, attention is to be given to the connection and/or intersection of the cross-deck structure to the hulls of multi hull craft.

4.2.12 Where water jet units are fitted, the impeller, hull ducting, grating, nozzle steering and reversing arrangements are to be examined as far as is practicable.

4.2.13 Where transom mounted propulsion units are fitted, the steering arrangements and any flexible transom seals are to be examined.

4.2.14 When chain cables are ranged, the anchors and cables are to be examined by the Surveyor, *see also* 5.3.7 and Table 3.5.1.

4.2.15 For SES craft any flexible skirts together with their attachment are to be examined.

4.2.16 For hydrofoil or foil assisted craft the attachment of foils is to be examined.

4.3 In-water Surveys

4.3.1 The Committee will accept an In-water Survey in lieu of the intermediate docking between Special Surveys required in a five year period on craft where an ***IWS** notation is assigned, *see* Ch 2,3.8.2.

4.3.2 The Committee may accept an In-water Survey in lieu of the intermediate docking between Special Surveys required in a five year period on craft where suitable protection is applied to the underwater portion of the hull. If requested, an ***IWS** class notation may be assigned on satisfactory completion of the survey, provided that the applicable requirements of the Rules are complied with, *see also* Ch 2,3.8.2.

4.3.3 The In-water Survey is to provide the information normally obtained from the Docking Survey, so far as is practicable.

4.3.4 Proposals for In-water Surveys are to be submitted in advance of the survey being required so that satisfactory arrangements can be agreed with LR.

4.3.5 The In-water Survey is to be carried out at agreed geographical locations under the surveillance of a Surveyor to LR, with the craft in sheltered waters; the in-water visibility is to be good and the hull below the waterline is to be clean. The Surveyor is to be satisfied that the method of pictorial presentation is satisfactory. There is to be good two-way communication between the Surveyor and the diver.

4.3.6 Diving and In-water Survey operations are to be carried out by firms recognised by the Committee. Continued recognition by the Committee will be dependent on the standard of workmanship by the firm being maintained to the satisfaction of LR's Surveyors.

4.3.7 If the In-water Survey reveals damage or deterioration that requires early attention, the Surveyor may require that the craft be dry-docked in order that a fuller survey can be undertaken and the necessary work carried out.

4.3.8 Where a vessel has an ***IWS** notation, the condition of the high resistant paint is to be confirmed at each dry-docking in order that the ***IWS** notation can be maintained.

4.3.9 Some National Administrations may have requirements additional to those of 4.3.1 to 4.3.8.

■ *Section 5* Special Survey – General – Hull requirements

5.1 General

5.1.1 The survey is to be of sufficient extent to ensure that the hull and related equipment is in satisfactory condition and is fit for its intended purpose, subject to proper maintenance and operation and to Periodical Surveys being carried out as required by the Regulations.

5.1.2 The requirements of Section 2 are to be complied with so far as applicable.

5.1.3 A Docking Survey in accordance with the requirements of 4.2 is to be carried out as part of the Special Survey.

5.1.4 For vessels assigned the notation 'laid-up', an Underwater Examination (UWE) and general examination of hull and machinery is to be carried out in lieu of the normal Special Survey requirements.

5.2 Preparation

5.2.1 The craft is to be prepared for survey in accordance with the requirements of Table 3.5.1. The preparation should be of sufficient extent to facilitate an examination to ascertain any excessive corrosion, erosion, deformation, fractures, damages and other structural deterioration.

5.2.2 Where, in accordance with Table 3.5.1, the craft is opened out by removal of linings, ceilings, cabin sole, etc., and defects are found, further opening out will be required in order that the Surveyor can confirm the full extent of the defects.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 3.5.1 Survey preparation

Special Survey I (Craft 5 years old)	Special Survey II (Craft 10 years old)	Special Survey III (Craft 15 years old) and subsequent special surveys
(1) The interior of the craft is to be sufficiently opened out by the removal of lining, ceiling/cabin sole, portable tanks and ballast, etc as required in order that the Surveyor may be satisfied as to the condition of suspect areas of the structure, *see* 1.5.3. A record is to be made of those areas where lining, ceiling/cabin sole etc., were opened out and where equipment was removed during the survey. This record is to be retained for reference during subsequent surveys. (2) Machinery compartments, fore and aft peaks and other spaces as directed by the Surveyor, are to be cleared and cleaned as necessary, and the bilges and limbers all fore and aft are to be cleaned and prepared for examination. Platform plates in engine spaces are to be lifted as may be necessary for the examination of the structure below. Where necessary, pipework may be required to be removed for examination of the structure. (3) In way of the single and/or double bottom areas, a sufficient amount of ceiling/cabin sole is to be lifted to permit examination of the bilges and/or tanktops below. (4) All integral tanks are to be cleaned as necessary to permit examination. (For steel craft, *see* Table 3.5.2).	In addition to the requirements for Special Survey I, the following are to be complied with: (1) The chain locker is to be cleared and cleaned internally for examination of the structure and examination of the cable securing arrangements. The chain cables/anchor warps, as applicable, are to be ranged for inspection. The anchors are to be cleaned and placed in an accessible position for inspection. (2) The rudder is to be unshipped for examination of the rudder stock and trunk at the discretion of the Surveyor.	In addition to the requirements for Special Survey II the following are to be complied with: (1) Linings, ceiling/cabin soles, etc are to be removed as required in order that the Surveyor may be satisfied as to the condition of the structure. For steel craft: (2) Portions of wood sheathing, or other covering, on steel decks are to be removed, as considered necessary by the Surveyor, in order to ascertain the condition of the plating. (3) Where spaces are insulated, sufficient insulation is to be removed in each space to enable the Surveyors to be satisfied with the condition of the structure. (4) Linings are to be removed in way of shell plating immediately above tank top connections to the side shell, in way of galleys/washrooms and beneath portlights and windows.

Table 3.5.2 *Tank internal examination requirements for steel craft*

Tank	Special Survey I (Craft 5 years old)	Special Survey II (Craft 10 years old)	Special Survey III (Craft 15 years old)	Special Survey IV (Craft 20 years old)	All Subsequent Special Surveys
Peaks	All tanks	All tanks	All tanks	All tanks	All tanks
Salt water ballast	All tanks	All tanks	All tanks	All tanks	All tanks
Lubricating oil	None	None	*See* Note 2	*See* Note 3	All tanks
Fresh water	None	*See* Note 1	*See* Note 2	*See* Note 3	All tanks
Oil fuel	None	*See* Note 1	*See* Note 2	*See* Note 3	All tanks
Sanitary	All tanks	All tanks	All tanks	All tanks	All tanks

NOTES
1. Tanks (excluding peak tanks) used exclusively for oil fuel or fresh water need not all be examined internally provided that the Surveyor is satisfied with the condition, after both external examination and testing and from an internal examination of the after end of one forward double bottom tank, and of one selected deep tank.
2. Tanks (excluding peak tanks) used exclusively for oil fuel, oil fuel and fresh water ballast, or lubricating oil, need not all be examined internally provided that the Surveyor is satisfied with the condition, after both external examination and testing and from an internal examination of one double bottom tank forward and one aft and one deep tank.
3. Tanks (excluding peak tanks) used exclusively for oil fuel, oil fuel and fresh water ballast, or lubricating oil, need not all be examined internally provided that the Surveyor is satisfied with the condition, after both external examination and testing and from internal examination of a least one double bottom tank amidships, one forward and one aft and one deep tank.
4. When examining tanks internally the Surveyor is to verify that striking plates or other additional reinforcement is fitted under sounding pipes. In the case of tanks fitted only with remote gauging facilities, the satisfactory operation of the gauges is to be confirmed.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

5.3 Examination and testing – General

5.3.1 All spaces within the hull and superstructure including integral tanks are to be examined (*see also* 5.4.1 for tank examinations on steel craft). Special attention is to be paid to any suspect areas, *see* 1.5.3.

5.3.2 Double bottom compartments, peak tanks and all other integral tanks are to be tested by a head sufficient to give the maximum pressure that can be experienced in service. Tanks may be tested afloat provided that their internal examination is also carried out afloat.

5.3.3 Where repairs are effected to the hull shell or bulkheads, any integral tanks in way are to be tested to the Surveyor's satisfaction on completion of these repairs.

5.3.4 All decks, casings and superstructures are to be examined.

5.3.5 The satisfactory attachment of any wood or other deck sheathing is to be confirmed, *see also* 5.4.4.

5.3.6 Attention is to be given to the corners of openings and other discontinuities in the hull structure.

5.3.7 The anchors are to be examined. If the chain cables are ranged they are to be examined together with the chain locker, *see* Table 3.5.1. If any length of chain cable is found to be reduced in mean diameter at its most worn part by 12 per cent or more from its nominal diameter, it is to be renewed. The windlass is to be examined.

5.3.8 The Surveyor is to be satisfied that there are suitable towlines and mooring ropes when these are a Rule requirement.

5.3.9 Representative structural fastenings, e.g. bolts in way of resiliently mounted deckhouses, are to be tested to ascertain their soundness and may require to be drawn for examination at the discretion of the Surveyor.

5.3.10 For craft to which Pt 17, Ch 1 applies, the Surveyor is to be satisfied as to the efficient condition of the means of escape from crew and passenger spaces, and spaces in which crew are normally employed.

5.4 Examination and testing – Additional items for steel craft

5.4.1 All integral tanks are generally to be internally examined. However, in certain circumstances the internal examination of lubricating oil, fresh water and oil fuel tanks may be waived. For the minimum extent of tank internal examination, *see* Table 3.5.2.

5.4.2 In salt water ballast spaces, integral sanitary tanks and bilges where the protective coating is found to be other than in GOOD condition as defined in 1.5.6 and it has not been repaired, maintenance of class will be subject to the spaces in question being internally examined and gauged as necessary at Annual Surveys.

5.4.3 The protection of steelwork, other than as referred to in 5.4.2 should be examined and made good where necessary on satisfactory completion of the survey. In areas where the inner surface of the bottom plating is covered with cement, asphalt or other composition, the removal of this covering may be dispensed with, provided that it is found sound and adhering satisfactorily to the steel.

5.4.4 Wood deck sheathing is to be examined and the caulking is to be tested and recaulked as necessary. If decay or rot is found, or the wood is excessively worn, the wood is to be renewed. Attention is to be given to the condition of the plating under wood deck sheathing or other deck covering. If it is found that such coverings are broken, or are not adhering closely to the plating, sections are to be removed as necessary to ascertain the condition of the plating. *See also* 1.2.1.

5.4.5 The structure in way of bimetallic connections, e.g. to aluminium alloy deckhouses is to be examined.

5.4.6 The Surveyors may require to measure the thickness of the material in any portion of the structure where signs of wastage are evident or wastage is normally found. Any parts of the structure which are found defective or excessively reduced in scantlings are to be made good by materials of the approved scantlings and quality. The minimum requirements for thickness measurements are given in Section 6.

5.5 Examination and testing – Additional items for aluminium alloy craft

5.5.1 The structure in way of any bimetallic connections is to be examined and the efficiency of the insulation arrangements confirmed.

5.5.2 The Surveyor may require to measure the thickness of the material in any portion of the structure where signs of deterioration are evident or may normally be found. Any parts of the structure which are found defective or excessively reduced in scantlings are to be made good by materials of the approved scantlings and quality.

5.6 Examination and testing – Additional items for composite craft

5.6.1 The bonded attachments of frames, floors, bulkheads, structural joinery, engine bearers, sterntubes, rudder tubes, and integral tank boundaries are to be examined.

5.6.2 The hull to deck joint together with any joints between the deck and deckhouses or superstructures are to be examined.

5.6.3 The structure in way of the bolted attachment of fittings including guardrail stanchions, windlass, shaft brackets, fendering, mooring bitts, etc. is to be examined.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Section 6
Special Survey – Thickness measurement requirements for steel craft

6.1 General

6.1.1 Thickness measurements, as required by Section 5 are to be carried out in accordance with the following requirements.

6.1.2 Thickness measurements are to be taken at the forward and aft areas of all plates. In all cases the measurements are to represent the average of the multiple measurements taken on each plate. The extent of local substantial corrosion of plates is to be established by intensive measurement in the affected areas. Where measured plates are renewed, the thicknesses of adjacent plates in the same strake are to be reported.

6.1.3 Thickness measurements are normally to be by means of ultrasonic test equipment and are to be carried out by a firm qualified as Grade 1 or Grade 2 according to LR Approval for Thickness Measurement of Hull Structures or by the Surveyor.

6.1.4 The degree of supervision or check testing by the Surveyor is dependent upon the grade of approval extended to the firm carrying out the thickness measurements.

(a) The work of firms having Grade 1 approval is subject to check testing by the Surveyor.

(b) Thickness measurements by firms having Grade 2 approval is to be carried out with the Surveyor substantially in attendance.

6.1.5 Thickness measurements may be carried out in association with the fourth Annual Survey.

6.1.6 The minimum requirements for thickness measurement are indicated in Table 3.6.1.

6.1.7 The Surveyor may extend the scope of thickness measurement if deemed necessary.

Table 3.6.1 Thickness measurement of steel craft

Special Survey I (Craft 5 years old)	Special Survey II (Craft 10 years old)	Special Survey III (Craft 15 years old) (Craft 20 years old and over)	Special Survey IV and subsequent
Suspect areas, as required by the Surveyor and may include areas where the coatings are *found to be other than in GOOD condition, see* Note 1.	Suspect areas, as required by the Surveyor and may include areas where the coatings are *found to be other than in GOOD condition, see* Note 1.	(1) Any exposed plating throughout the Main Deck. (2) Shell plating in way of the waterline throughout the length of the craft. (3) Suspect areas, as required by the Surveyor and may include areas where the coatings are found to be other than in GOOD condition, *see* Note 1.	(1) All Main Deck plating outside deckhouses or superstructures and including plating in way of wood deck planking or sheathing. (2) Shell plating in way of, and below, the waterline throughout the length of the craft. (3) 2 transverse sections of deck and shell plating within 0,5*L* amidships. (4) Suspect areas, as required by the Surveyor and to include as applicable: (a) Areas where the coatings are found to be other than in GOOD condition. (b) Shell and tanktop plating immediately adjacent to tank top margins. (c) Bottom shell in way of any cement, asphalt or other composition. (d) Shell plating below portlights and windows. (e) Tanktop plating below ceiling or cabin soles. (f) Deck plating and side shell plating in way of galleys, washrooms and refrigerated store spaces. (g) Structure in way of integral sanitary tanks.

NOTES
1. Suspect areas are locations within the hull structure vulnerable to increased likelihood of structural deterioration and may include, for steel hulls, areas of substantial corrosion and/or fatigue cracking, *see also* 1.5.3 and 5.4.6.
2. Coating condition for steel craft is defined in 1.5.6.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

6.2 Thickness measurement reporting

6.2.1 A report is to be prepared by the approved firm carrying out the thickness measurement. The report is to give the location of measurement, the thickness measured as well as the corresponding original thickness. The report is to give the date when the measurement was carried out, the type of measuring equipment, names of personnel and their qualifications and is to be signed by the operator and supervisor.

6.2.2 The thickness measurement report is to be verified and signed by the Surveyor.

■ *Section 7*
Machinery surveys – General requirements

7.1 Annual, Intermediate and Docking Surveys

7.1.1 For Annual, Intermediate and Docking Surveys, *see* Sections 2, 3 and 4.

7.1.2 For craft where an Approved Planned Maintenance Scheme is in operation an Annual Survey of the machinery is to be carried out together with an audit of the maintenance and monitoring records.

7.1.3 For vessels assigned the notation 'laid-up', a general examination of the machinery is to be carried out in lieu of the normal Annual Survey/Intermediate Survey requirements.

7.2 Complete Surveys

7.2.1 While the craft is in dry-dock, all openings to the sea in the machinery spaces and pump-rooms, together with the valves, cocks and the fastenings with which these are connected to the hull, are to be examined.

7.2.2 Athwartships thrust propellers are to be generally examined so far as is possible in dry dock and tested under working conditions afloat for satisfactory operation.

7.2.3 All shafts (except screwshafts and tube shafts, for which special arrangements are detailed in Section 11), thrust block and all bearings are to be examined. The lower halves of bearings need not be exposed if alignment and wear are found to be acceptable.

7.2.4 An examination is to be made as far as practicable of all propulsion gears complete with all wheels, pinions, shafts, bearings and gear teeth, thrust bearings and incorporated clutch arrangements.

7.2.5 The following auxiliaries and components are also to be examined:

(a) Auxiliary engines, auxiliary air compressors with their intercoolers, filters and/or oil separators and safety devices, and all pumps and components used for essential services.
(b) Steering machinery.
(c) Windlass and associated driving equipment, where fitted.
(d) The holding down bolts, chocks or resilient mounts of main and auxiliary engines, gearcases, thrust blocks and intermediate shaft bearings.

7.2.6 All air receivers for essential services, together with their mountings, valves and safety devices, are to be cleaned internally and examined internally and externally. If internal examination of the air receivers is not practicable, they are to be tested hydraulically to 1,3 times the working pressure.

7.2.7 The valves, cocks and strainers of the bilge system including bilge injection, are to be opened up as considered necessary by the Surveyor and together with pipes, are to be examined and tested under working conditions. The oil fuel, feed, lubricating oil and cooling water systems also any ballast connections together with all pressure filters, heaters and coolers used for essential services, are to be opened up and examined or tested, as considered necessary by the Surveyor. All safety devices for the foregoing items are to be examined.

7.2.8 Fuel tanks which do not form part of the craft's structure are to be examined, and if considered necessary by the Surveyor, they are to be tested to the pressure specified for new tanks. The tanks need not be examined internally at the first survey if they are found satisfactory on external inspection. The mountings, fittings and remote controls of all oil fuel tanks are to be examined, so far as is practicable.

7.2.9 Where remote and/or automatic controls are fitted for essential machinery, they are to be tested to demonstrate that they are in good working order.

7.2.10 In addition to the above, detailed requirements for gas turbines and oil engines and electrical installations are given in Sections 8, 9 and 10 respectively. In certain instances, upon application by the Owner or where indicated by the maker's servicing recommendations, the Committee will give consideration to the circumstances where deviation from these detailed requirements is warranted, taking account of design, appropriate indicating equipment (e.g. vibration indicators) and operational records, *see* Ch 2,4.5.17 and 4.5.23.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Section 8
Gas turbines – Detailed requirements

8.1 Complete Surveys

8.1.1 The requirements of Section 7 are to be complied with. *See* 7.2.10 regarding any deviation from the following.

8.1.2 The following parts are to be opened out and examined:

- Compressor including impellers or blading, rotors and casing.
- Combustion chambers, burners, intercoolers and heat exchangers.
- Gas, air and fuel piping and fittings.
- Gas generator turbine and power turbine blading, rotors and casing.
- Rotors to include couplings, clutches, bearings and tie bolts.
- Auxiliary mounted fuel, L.O. and cooling water pumps, their drive transmissions and fittings.
- Starting system (for starting air pipes, *see* 9.1.3).
- All safety devices and local controls.
- Mountings and support frame.

8.1.3 The compressor/turbine units are to be operated and maintained in accordance with the manufacturer's instructions. Overhauls, including the prescribed replacement of limited life components, are to be undertaken at the specified intervals. Full service records are to be available for review by the Surveyor.

8.1.4 The manoeuvring of the propulsion system is to be tested under working conditions.

Section 9
Oil engines – Detailed requirements

9.1 Complete Surveys

9.1.1 The requirements of Section 7 are to be complied with. *See* 7.2.10 regarding any deviation from the following.

9.1.2 The following parts are to be opened out and examined:

- Cylinders and covers.
- Valves and valve gear.
- Pistons and connecting rods.
- Crankshafts and all bearings.
- Crankcases and entablatures.
- Crankcase door fastenings and explosion relief devices.
- Turbo-chargers and their associated coolers.
- Air compressors and their intercoolers.
- Filters and/or separators and safety devices.
- Fuel pumps and fittings.
- Camshaft drives and balancer units.
- Vibration dampers or detuners.
- Flexible couplings and clutches.
- Reverse gears.
- Attached pumps and cooling arrangements.

9.1.3 Selected pipes in the starting air system, if fitted, are to be removed for internal examination and are to be hammer tested. If any appreciable amount of lubricating oil is found in the pipes, the starting air system is to be thoroughly cleaned internally by steaming out, or other suitable means. Some of the pipes selected are to be those adjacent to the starting air valves at the cylinders and to the discharges from the air compressors.

9.1.4 The electric ignition system, if fitted, is to be examined and tested.

9.1.5 The manoeuvring of engines is to be tested under working conditions. Initial starting arrangements are to be tested.

Section 10
Electrical equipment

10.1 Annual and Intermediate Surveys

10.1.1 The requirements of 2.2.14 and 3.2.4 are to be complied with as far as applicable.

10.2 Complete Surveys

10.2.1 An electrical insulation resistance test is to be made on the electrical equipment and cables. The installation may be sub-divided, or equipment which may be damaged disconnected, for the purpose of this test.

10.2.2 The fittings on the main and emergency switchboards, section boards and distribution boards are to be examined and over-current protective devices and fuses inspected to verify that they provide suitable protection for their respective circuits.

10.2.3 Generator circuit-breakers are to be tested, so far as is practicable, to verify that protective devices including preference tripping relays, if fitted, operate satisfactorily.

10.2.4 The electric cables and their securing arrangements are to be examined, so far as is practicable, without undue disturbance of fixtures or casings unless opening up is considered necessary as a result of observation or of the tests required by 10.2.1.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

10.2.5 The generator prime movers are to be surveyed as required by Sections 8 and 9 and the governing of the engines tested. The motors concerned with essential services together with associated control and switch gear are to be examined and if considered necessary, are to be operated, so far as is practicable, under working conditions. All generators and steering gear motors are to be examined and are to be operated under working conditions, though not necessarily under full load or simultaneously.

10.2.6 Where transformers or electrical apparatus associated with supplies to essential services are liquid filled or cooled by a liquid in direct contact with current carrying parts, the owner is to arrange for samples of the liquid to be taken and tested, by a competent authority, in accordance with the equipment manufacturer's requirements, and a certificate giving the test results is to be furnished to the Surveyor.

10.2.7 Navigation light indicators are to be tried under working conditions, and correct operation on the failure of supply or failure of navigation lights verified.

10.2.8 The emergency sources of electrical power, where fitted, together with their automatic arrangements and associated circuits are to be tested.

10.2.9 Emergency lighting, transitional emergency lighting, supplementary emergency lighting, general emergency alarm and public address systems are to be tested as far as practicable.

10.2.10 Where the craft is electrically propelled, the propulsion motors, generators, cables and all ancillary electrical gear, exciters and ventilating plant (including coolers) associated therewith are to be examined, and the insulation resistance to earth is to be tested. Special attention is to be given to windings, commutators and slip-rings. The operation of protective gear and alarm devices is to be checked, so far as is practicable. Liquids for filling and cooling, if used, are to be tested in accordance with 10.2.6. Interlocks intended to prevent unsafe operations or unauthorised access are to be checked to verify that they are functioning correctly. Emergency overspeed governors are to be tested.

10.2.11 Where batteries provide the source of power for any essential services, their installation, including charging and ventilation arrangements, is to be examined.

Section 11
Screwshafts, tube shafts, propellers and water jet units

11.1 Frequency of surveys

11.1.1 Shafts with keyed propeller attachments and fitted with continuous liners or approved oil glands, or made of approved corrosion resistant materials, are to be surveyed at intervals of five years when the keyway complies fully with the present Rules.

11.1.2 Shafts having keyless type propeller attachments are to be surveyed at intervals of five years provided they are fitted with approved oil glands or are made of approved corrosion resistant materials.

11.1.3 Shafts having solid coupling flanges at the after end are to be surveyed at intervals of five years provided they are fitted with approved oil glands or are made of approved corrosion resistant materials.

11.1.4 All other shafts not covered by 11.1.1 to 11.1.3 are to be surveyed at intervals of $2^1/_2$ years.

11.1.5 Controllable pitch propellers for main propulsion purposes are to be surveyed at the same intervals as the screwshaft.

11.1.6 Directional propeller units for main propulsion purposes are to be surveyed at intervals not exceeding five years.

11.1.7 Water jet units for main propulsion purposes are to be surveyed at intervals not exceeding five years provided the impeller shafts are made of approved corrosion resistant material or have approved equivalent arrangements.

11.1.8 Athwartship thrust propellers and shaftings are to be surveyed at intervals not exceeding five years, *see* 7.2.2.

11.2 Normal surveys

11.2.1 All screwshafts are to be withdrawn for examination by LR's Surveyors at the intervals prescribed in 11.1.1 to 11.1.4. The after end of the cylindrical part of the shaft and forward one third of the shaft cone, or fillet of the flange, is to be examined by a magnetic particle crack detection method. In the case of a keyed propeller attachment at least the forward one third of the shaft cone is to be examined with the key removed. Weardown is to be measured and the sterntube bearings, oil glands, propellers and fastenings are to be examined. Controllable pitch propellers where fitted are to be opened up and the working parts examined, together with the control gear.

11.2.2 Directional propeller units are to be dismantled for examination of the propellers, shafts, gearing and control gear.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

11.2.3 Water Jet Units are to be dismantled for examination of the impeller, casing, shaft, shaft seal, shaft bearing, inlet and outlets channels, steering nozzle, reversing arrangements, and control gear.

11.3 Screwshaft Condition Monitoring (SCM)

11.3.1 Where oil lubricated shafts with approved oil glands are fitted, and the Owner has complied with the following requirements, the descriptive note **SCM** (Screwshaft Condition Monitoring) may be entered in column 6 of the *Register Book*:

(a) Lubricating oil analysis to be carried out regularly at intervals not exceeding six months. The lubricating oil analysis documentation is to be available on board. Each analysis is to include the following minimum parameters:
- water content
- chloride content
- bearing material and metal particles content
- oil ageing (resistance to oxidation).

(b) Oil samples are to be taken under service conditions and are to be representative of the oil within the sterntube.

(c) Oil consumption is to be recorded.

(d) Bearing temperatures are to be recorded (two temperature sensors or other approved arrangements are to be provided).

(e) Facilities are to be provided for measurement of bearing weardown.

(f) Oil glands are to be capable of being replaced without withdrawal of the screwshaft.

11.3.2 For maintenance of the descriptive note **SCM**, the records of analyses, consumption and temperatures, together with weardown readings, are to be retained on board and audited annually.

11.3.3 Where the requirements for the descriptive note **SCM** have been complied with, the screwshaft need not be withdrawn at surveys as required by 11.2.1 provided all condition monitoring data is found to be within permissible limits and all exposed areas of the shaft are examined by a magnetic particle crack detection method. The remaining requirements of 11.2.1 are to be complied with. Where the Surveyor considers that the data presented is not entirely to his satisfaction the shaft will be required to be withdrawn in accordance with 11.2.1.

11.4 Modified Survey

11.4.1 A Modified Survey may be accepted at alternate five-yearly surveys for shafts described in 11.1.1 provided they are fitted with oil lubricated bearings and approved oil glands, and also for those in 11.1.2 and 11.1.3.

11.4.2 The Modified Survey is to consist of the partial withdrawal of the shaft, sufficient to ascertain the condition of the stern bearing and shaft in way. For keyless propellers or shafts with a solid flange connection to the propeller a visual examination to confirm the good condition of the sealing arrangements is to be made. The oil glands are to be capable of being replaced without removal of the propeller. The forward bearing and all accessible parts including the propeller connection to the shaft are to be examined as far as possible. Wear down is to be measured and found satisfactory. Where a controllable pitch propeller is fitted, at least one of the blades is to be dismantled complete for examination of the working parts and the control gear.

11.4.3 For keyed propellers, the after end of the cylindrical part of the shaft and forward one third of the shaft cone is to be examined by a magnetic particle crack detection method, for which dismantling of the propeller and removal of the key will be required.

11.4.4 Where the descriptive note **SCM** has been assigned as described in 11.3.1 and all data is found to be within permissible limits, partial withdrawal of the shaft may not be required. Where doubt exists regarding any of the above findings the shaft is to be withdrawn to permit an entire examination.

11.5 Partial Survey

11.5.1 For shafts where the Modified Survey is applicable, upon application by the Owner, the Committee will be prepared to give consideration to postponement of the survey for a maximum period of half the specified cycle provided a Partial Survey is held.

11.5.2 The Partial Survey is to consist of the propeller being backed off in any keyed shaft and the top half of the cone examined by an efficient crack detection method for which removal of the key will be required. Oil gland and seals are to be examined and dealt with as necessary. Weardown is to be measured and found satisfactory. Propeller and fastenings are to be examined.

11.5.3 The Committee will be prepared to give consideration to the circumstances of any special case upon application by the Owner.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Section 12
Classification of craft not built under survey

12.1 General

12.1.1 When classification is desired for a craft not built under the supervision of LR's Surveyors, application should be made to the Committee in writing.

12.1.2 Periodical Surveys of such craft, when classed, are subsequently to be held as in the case of craft built under survey.

12.1.3 Where classification is desired for a craft which is classed by another recognised Society, special consideration will be given to the scope of the survey.

12.2 Hull and equipment

12.2.1 Plans showing the main scantlings and arrangements of the actual craft together with any proposed alterations are to be submitted for approval.These should comprise plans of the midship section, longitudinal section and decks, and such other plans as may be requested. If plans cannot be obtained or prepared by the Owner, facilities are to be given for LR's Surveyor to obtain the necessary information from the craft.

12.2.2 Particulars of the process of manufacture and the testing of the material of construction are to be supplied. The requirements for composite craft will be specially considered.

12.2.3 The full requirements of Sections 5 and 6 are to be carried out as applicable. Craft of recent construction will receive special consideration.

12.2.4 During the survey, the Surveyors are to satisfy themselves regarding the workmanship and verify the approved scantlings and arrangements. For this purpose, and also in order to ascertain the amount of any deterioration of steel craft, parts of the structure will require to be gauged as necessary. Full particulars of the anchors, chain cables and equipment are to be submitted. For craft to which Pt 15, Ch 1 applies, fire protection, detection and extinction are to be in accordance with the Rules.

12.2.5 When the full survey requirements indicated in 12.2.3 and 12.2.4 cannot be completed at one time, the Committee may consider granting an interim record for a limited period. The conditions regarding the completion of the survey will depend on the merits of each particular case, which should be submitted for consideration.

12.3 Machinery

12.3.1 To facilitate the survey, the following plans and particulars (plans of piping are to be diagrammatic), together with the particulars of the materials used in the construction of any boilers, air receivers and important forgings are to be submitted:

- Name of manufacturer of engine and gearbox including the manufacturer's type designation of engine and gearbox, together with the continuous shaft power of the engine at the crankshaft coupling with the revolutions per minute of crankshaft and propeller.
- General pumping arrangements, including air and sounding pipes (Builder's plan).
- Bilge, ballast and oil fuel pumping arrangements including the capacities of the pumps on bilge service.
- Arrangement and dimensions of any steam pipes.
- Arrangement of oil fuel pipes and fittings at settling and service tanks.
- Arrangement of oil fuel piping in connection with oil burning installations.
- Oil fuel overflow systems, where these are fitted.
- Arrangement of boiler feed systems.
- Oil fuel settling, service and other oil fuel tanks not forming part of the craft's structure.
- Boilers and economisers.
- Air receivers.
- Crank, thrust, intermediate and screw shafting.
- Details of water jet or directional propeller units, if fitted.
- Clutch and reversing gear with methods of control.
- Reduction gearing.
- Propeller (including spare propeller if supplied) where the diameter exceeds 1 m.
- Electrical circuits.
- Arrangement of compressed air systems for main and auxiliary services.
- Arrangement of lubricating oil, other flammable liquids and cooling water systems for main and auxiliary services.
- Steering gear including control arrangement.
- Arrangement of exhaust system indicating materials, method of cooling, and if water spray injected, the method of draining.

12.3.2 Plans additional to those detailed in 12.3.1 are not to be submitted unless the machinery is of a novel or special character affecting classification.

12.3.3 Where remote and/or automatic controls are fitted to propulsion machinery and essential auxiliaries, a description of the scheme is to be submitted.

12.3.4 For new craft and craft which have been in service less than two years, calculations of the torsional vibration characteristics of the propelling machinery are to be submitted for consideration, as required for craft constructed under Special Survey. For older craft the circumstances will be specially considered in relation to their service record and type of machinery installed. Where calculations are not submitted, the Committee may require that the machinery certificate be endorsed to this effect. When desired by the Owner, the calculations and investigation of the torsional vibration characteristics of the machinery may be carried out by LR upon special request.

12.3.5 The main and auxiliary machinery, feed pipes, compressed air pipes and boilers are to be examined as required at Complete Surveys. Working pressures are to be determined from the actual scantlings in accordance with the Rules.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

12.3.6 The screwshaft is to be drawn and examined.

12.3.7 Any steam pipes or oil burning installations are to be examined and tested as required by Pt 1, Ch 3,15 or Ch 3,16 of the *Rules and Regulations for the Classification of Ships*.

12.3.8 The bilge, ballast and oil fuel pumping arrangements are to be examined and amended, as necessary, to comply with the Rules.

12.3.9 The electrical equipment is to be examined as required at Complete Surveys.

12.3.10 The whole of the machinery, including essential controls, is to be tried under working conditions to the Surveyor's satisfaction.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

12 **Classification of yachts not built under survey**

Section 1 General

1.1 Frequency of surveys

1.1.1 The requirements of this Chapter are applicable to the Periodical Surveys set out in Ch 2,4.5. Except as amended at the discretion of the Committee, the periods between such surveys are as follows:

(a) Intermediate Surveys as required by Ch 2,4.5.5.
(b) Docking Surveys as required by Ch 2,4.5.6 and 4.5.7.
(c) Special Surveys at five-yearly intervals, *see* Ch 2,4.5.11. For alternative arrangements, *see also* Ch 2,4.5.12, 4.5.13 and 4.5.15.
(d) Complete Surveys of machinery at five-yearly intervals, *see* Ch 2,4.5.16. For alternative arrangements, *see also* Ch 2,4.5.17, 4.5.19, 4.5.21, 4.5.22 and 4.5.23.

1.1.2 When it has been agreed that the Complete Survey of the hull and machinery may be carried out on the Continuous Survey basis, all compartments of the hull and all items of machinery are to be opened for survey in rotation to ensure that the interval between consecutive examinations of each part will not exceed five years, *see* Ch 2,4.5.15 and 4.5.19.

1.1.3 For the frequency of surveys of screwshafts, tube shafts, propellers and water jet units, *see* Section 10.

1.2 Surveys for damage or alterations

1.2.1 At any time when a yacht is undergoing alterations or damage repairs, any exposed parts of the structure normally difficult to access are to be specially examined, e.g. if any part of the main or auxiliary machinery is removed for any reason, the hull structure in way is to be carefully examined by the Surveyor, or when cement in the bottom or sheathing on decks is removed the structure in way is to be examined before the cement or sheathing is relaid.

1.3 Unscheduled surveys

1.3.1 In the event that Lloyd's Register (hereinafter referred to as 'LR') has cause to believe that its Rules and Regulations are not being complied with, LR reserves the right to perform unscheduled surveys of the hull or machinery.

1.3.2 In the event of significant damage or defect affecting any yacht, LR reserves the right to perform unscheduled surveys of the hull or machinery of other similar yachts classed by LR and deemed to be vulnerable.

1.4 Surveys for the issue of Convention certificates

1.4.1 Surveys are to be held by LR when so appointed, or by the Exclusive Surveyors to a National Administration or by an IACS Member when so authorised by the National Authority, or, in the case of Cargo Ship Safety Radio Certificates or Safety Management Certificates, by any organisation authorised by the National Authority. In the case of dual classed yachts, Convention Certificates may be issued by the other Society with which the yacht is classed provided this is recognised in a formal Dual Class Agreement with LR and provided the other Society is also authorised by the National Authority.

1.5 Definitions

1.5.1 A **Ballast tank** is a tank which is used primarily for salt water ballast.

1.5.2 **Spaces** are separate hull compartments including integral tanks.

1.5.3 **Suspect areas** are locations within the hull structure vulnerable to increased likelihood of structural deterioration and may include:

(a) For steel hulls, areas of substantial corrosion and/or fatigue cracking.
(b) For aluminium alloy hulls, areas of fatigue cracking and areas in the vicinity of bimetallic connections.
(c) For composite hulls, areas subject to impact damage.
(d) For wood hulls, areas subject to decay as a result of fresh water ingress or poor ventilation.
(e) For high speed craft (as defined in Ch 2,2.2.7), areas of the bottom structure forward prone to slamming damage.
(f) For sailing craft, areas subject to high local stresses due to rigging loads and ballast keel attachments.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.5.4 **Substantial corrosion** is wastage of individual steel or aluminium plates and stiffeners in excess of 75 per cent of allowable margins, but within acceptable limits.

1.5.5 **Protective coatings** for steel craft should usually be hard coatings. Other coating systems (e.g. soft coating) may be considered acceptable as alternatives provided they are applied and maintained in compliance with the manufacturer's specification.

1.5.6 **Coating condition** for steel yacht is defined as follows:

GOOD condition with only minor spot rusting affecting not more than 20 per cent of areas under consideration.

Section 2
Intermediate Surveys – Hull and machinery requirements

2.1 General

2.1.1 At Intermediate Surveys, the Surveyor is to examine the hull and machinery, so far as necessary and practicable, in order to be satisfied as to their general condition.

2.2 Intermediate Surveys

2.2.1 The Surveyor is to be satisfied regarding:

(a) The efficient condition of hatchways on freeboard and superstructure decks, weather deck plating, ventilator coamings and air pipes, exposed casings, skylights, flush deck scuttles, deckhouses and companionways, superstructure bulkheads, side, bow and stern doors, windows and storm shutters, side scuttles and deadlights, chutes and other openings, together with all closing appliances and flame screens.

(b) The efficient condition of scuppers and sanitary discharges (so far as is practicable); valves on discharge lines (so far as is practicable) and their controls; guard rails and bulwarks; freeing ports, gangways and life-lines.

(c) The efficient condition of bilge level detection and alarm systems on yachts assigned a **UMS** notation.

2.2.2 The anchoring and mooring equipment including anchor warps or wire ropes is to be examined so far as is practicable. For all yachts over 10 years of age the anchors are to be partially lowered and raised using the windlass.

2.2.3 The watertight doors in watertight bulkheads are to be examined and operationally tested locally and where applicable remotely. Other watertight bulkhead penetrations, are to be examined so far as is practicable.

2.2.4 The Surveyor is to examine and test in operation all main and auxiliary steering arrangements including their associated equipment and control systems.

2.2.5 The Surveyor is to generally inspect the machinery spaces with particular attention being given to the propulsion system, auxiliary machinery and to the existence of any fire and explosion hazards. Where applicable, emergency escape routes are to be checked to ensure that they are free of obstruction.

2.2.6 The means of communication between the navigating bridge and the machinery control positions, as well as the bridge and the alternative steering position, if fitted, are to be tested.

2.2.7 The bilge pumping systems and bilge wells, including operation of extended spindles, self closing drain cocks and level alarms, where fitted, are to be examined so far as is practicable. Satisfactory operation of the bilge pumps, including any hand pumps, is to be proven.

2.2.8 Any pressure vessels including safety devices, foundations, controls, relieving gear, associated piping systems, insulation and gauges, are to be generally examined. Surveyors should confirm that Periodical Surveys of pressure vessels have been carried out as required by the Rules and that the safety devices have been tested.

2.2.9 The electrical equipment and cabling forming the main and emergency electrical installations are to be generally examined under operating conditions so far as is practicable. The satisfactory operation of the main and emergency sources of power and electrical services essential for safety in an emergency is to be verified; where the sources of power are automatically controlled they should be tested in the automatic mode. Bonding straps for the control of static electricity and earthing arrangements are to be examined where fitted.

2.2.10 The electrical generating sets are to be examined under working conditions.

2.2.11 For yachts having **UMS** or **CCS** notation, a General Examination of automation equipment is to be carried out. Satisfactory operation of safety devices and control systems is to be verified.

2.2.12 For yachts to which Pt 17, Ch 1 applies, the arrangements for fire protection, detection and extinction are to be examined and are to include the following items, as required to be fitted in accordance with the Rules:

(a) Verification, so far as is practicable, that no significant changes have been made to the arrangement of structural fire protection.

(b) Verification of the operation of manual and/or automatic doors where fitted.

(c) Verification that fire control plans are properly posted.

(d) Examination, so far as is possible, and testing as feasible, of the fire and/or smoke detection and alarm system(s).

(e) Examination of fire main system, and confirmation that each fire pump, including the emergency fire pump can be operated separately so that the required jets of water can be produced simultaneously from different hydrants.

(f) Verification that fire-hoses, nozzles, applicators and spanners are in good working condition and situated at their respective locations.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

(g) Examination of fixed fire-fighting systems controls, piping, instructions and marking, checking for evidence of proper maintenance and servicing, including date of last systems tests.
(h) Verification that all portable and semi-portable fire-extinguishers are in their stowed positions, checking for evidence of proper maintenance and servicing, conducting random checks for evidence of discharged containers.
(j) Verification, so far as is practicable, that the remote control for stopping fans and machinery and shutting off fuel supplies in machinery spaces and, where fitted, the remote controls for stopping fans in accommodation spaces and the means of cutting off power to the galley are in good working order.
(k) Examination of the closing arrangements of ventilators, skylights and doorways where applicable.
(l) Verification that the fireman's outfits are complete and in good condition.
(m) Verification that gas installations for domestic purposes comply with the relevant statutory requirements.

2.2.13 For steel yachts a general examination of salt-water ballast tanks, integral sanitary tanks and bilges is to be carried out as required below. If such inspections reveal no visible structural defects then the examination may be limited to a verification that the protective coating remains in GOOD condition as defined in 1.5.6. When considered necessary by the Surveyor thickness measurement of the structure is to be carried out. Where the protective coating is found to be other than in GOOD condition, and it has not been repaired, maintenance of class will be subject to the spaces in question being internally examined and gauged as necessary annually.
(a) For all yachts over five years of age and up to 10 years of age, representative salt water ballast tanks, integral sanitary tanks and bilges are to be generally examined. Where the protective coating is found to be other than in GOOD condition, as defined in 1.5.6, or other defects are found, the examination is to be extended to other spaces of the same type.
(b) For steel yachts over 10 years of age all salt water ballast tanks, integral sanitary tanks and bilges are to be generally examined.

2.2.14 Representative internal spaces including fore and aft peak spaces, machinery spaces, bilges, etc are to be generally examined. These spaces should include all suspect areas, *see* 1.5.3.

2.2.15 In sailing and auxiliary yachts, the mast(s), mast steps, spars, standing and running rigging, rigging screws, chainplates and sails are to be examined so far as is practicable.

Section 3
Docking Surveys and In-water Surveys – Hull and machinery requirements

3.1 General

3.1.1 At Docking Surveys or In-water Surveys the Surveyor is to examine the yacht and machinery, so far as necessary and practicable, in order to be satisfied as to the general condition.

3.2 Docking Surveys

3.2.1 Where a yacht is in dry-dock or on a slipway it is to be placed on blocks of sufficient height and proper staging is to be erected as may be necessary, for the examination of the outside of the hull, rudder(s) and underwater fittings. The outside surface of the hull is to be cleaned as may be required by the Surveyor.

3.2.2 Attention is to be given to parts of the external hull structure particularly liable to structural deterioration from causes such as high stresses, chafing and lying on the ground, and to areas of structural discontinuity.

3.2.3 The following parts of the external hull structure are to be specially examined:
(a) For steel hulls attention is to be given to parts of the structure particularly liable to excessive corrosion and to any undue unfairness of the plating of the bottom. The coating system is to be examined and made good as necessary.
(b) For aluminium alloy hulls attention is to be given to areas adjacent to any bimetallic connections at skin fittings, etc.
(c) For composite hulls the gelcoat or other protective finish is to be examined for surface cracking, blistering or other damage which may impair the efficiency of the protection to the underlying laminate.
(d) For wood hulls the condition of any caulking or sheathing is to be examined as applicable. The condition of external fastenings may require to be confirmed by removal at the discretion of the Surveyor.
(e) For sailing or auxiliary yachts fitted with external ballast, the attachment of bilge or centreline ballast keels is to be examined.

3.2.4 Where required by the Rules, the satisfactory condition of the cathodic protection is to be confirmed.

3.2.5 The clearances in the rudder bearings and pintles are to be measured. Where considered necessary by the Surveyor rudders are to be lifted for examination of the stock. The securing of rudder couplings and/or pintle fastenings is to be confirmed.

3.2.6 The sea connections and overboard discharge valves, their attachments to the hull and the gratings at the sea inlets are to be examined.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

3.2.7 The propeller and fastenings are to be examined. The sternbush is to be examined as far as is practicable.

3.2.8 The clearance in the sternbush or the efficiency of the oil gland is to be ascertained. The clearance of any shaft bracket bearings is to be ascertained.

3.2.9 The inboard shaft seals or glands are to be examined. Where flexible sternglands are fitted, the satisfactory condition of the rubber hose and securing clips is to be confirmed.

3.2.10 Special attention is to be given to the hull in way of underwater fittings such as transverse thrusters, stabilisers, etc.

3.2.11 Where applicable, attention is to be given to the connection and/or intersection of the cross-deck structure to the hulls of multi hull craft.

3.2.12 Where water jet units are fitted, the impeller, hull ducting, grating, nozzle steering and reversing arrangements are to be examined as far as is practicable.

3.2.13 Where transom mounted propulsion units are fitted, the steering arrangements and any flexible transom seals are to be examined.

3.2.14 When chain cables are ranged, the anchors and cables are to be examined by the Surveyor, *see also* 4.3.7 and Table 4.4.1.

3.3 In-water Surveys

3.3.1 The Committee will accept an In-water Survey in lieu of the intermediate docking between Special Surveys required in a five year period on yachts where an ***IWS** notation is assigned, *see* Ch 2,3.8.2.

3.3.2 The Committee may accept an In-water Survey in lieu of the intermediate docking between Special Surveys required in a five year period on yachts where suitable protection is applied to the underwater portion of the hull. If requested, an ***IWS** class notation may be assigned on satisfactory completion of the Survey, provided that the applicable requirements of the Rules are complied with, *see also* Ch 2,3.8.2.

3.3.3 The In-water Survey is to provide the information normally obtained from the Docking Survey, so far as is practicable.

3.3.4 Proposals for In-water Surveys are to be submitted in advance of the survey being required so that satisfactory arrangements can be agreed with LR.

3.3.5 The In-water Survey is to be carried out at agreed geographical locations under the surveillance of a Surveyor to LR, with the yacht in sheltered waters; the in-water visibility is to be good and the hull below the waterline is to be clean. The Surveyor is to be satisfied that the method of pictorial presentation is satisfactory. There is to be good two-way communication between the Surveyor and the diver.

3.3.6 Diving and In-water Survey operations are to be carried out by firms recognised by the Committee. Continued recognition by the Committee will be dependent on the standard of workmanship by the firm being maintained to the satisfaction of LR's Surveyors.

3.3.7 If the In-water Survey reveals damage or deterioration that requires early attention, the Surveyor may require that the yacht be dry-docked in order that a fuller survey can be undertaken and the necessary work carried out.

3.3.8 Where a yacht has an ***IWS** notation, the condition of the high resistant paint is to be confirmed at each dry-docking in order that the ***IWS** notation can be maintained.

3.3.9 Some National Administrations may have requirements additional to those of 3.3.1 to 3.3.8.

■ *Section 4* Special Survey – General – Hull requirements

4.1 General

4.1.1 The survey is to be of sufficient extent to ensure that the hull and related equipment is in satisfactory condition and is fit for its intended purpose, subject to proper maintenance and operation and to Periodical Surveys being carried out as required by the Regulations.

4.1.2 The requirements of Section 2 are to be complied with so far as applicable.

4.1.3 A Docking Survey in accordance with the requirements of 3.2 is to be carried out as part of the Special Survey.

4.1.4 For sailing and auxiliary yachts fitted with unclassed machinery installations the requirements of 11.3.1 are to be complied with.

4.2 Preparation

4.2.1 The yacht is to be prepared for survey in accordance with the requirements of Table 4.4.1. The preparation should be of sufficient extent to facilitate an examination to ascertain any excessive corrosion, erosion, deformation, fractures, damages and other structural deterioration.

4.2.2 Where, in accordance with Table 4.4.1, the yacht is opened out by removal of linings, cabin sole, etc., and defects are found, further opening out will be required in order that the Surveyor can confirm the full extent of the defects.

4.3 Examination and testing – General

4.3.1 All spaces within the hull and superstructure including integral tanks are to be examined (*see also* 4.4.1 for tank examinations on steel craft). Special attention is to be paid to any suspect areas, *see* 1.5.3.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 4.4.1 Survey preparation

Special Survey I (Yachts 5 years old)	Special Survey II (Yachts 10 years old)	Special Survey III (Yachts 15 years old) and subsequent special surveys
(1) The interior of the yacht is to be sufficiently opened out by the removal of lining, ceiling/cabin sole, portable tanks and ballast, etc as required in order that the Surveyor may be satisfied as to the condition of suspect areas of the structure (*see* 1.5.3). A record is to be made of those areas where lining, cabin sole, etc., were opened out and where equipment was removed during the survey. This record is to be retained for reference during subsequent surveys. (2) Machinery compartments, fore and aft peaks and other spaces as directed by the Surveyor, are to be cleared and cleaned as necessary, and the bilges and limbers all fore and aft are to be cleaned and prepared for examination. Platform plates in engine spaces are to be lifted as may be necessary for the examination of the structure below. Where necessary, pipework may be required to be removed for examination of the structure. (3) In way of the single and/or double bottom areas, a sufficient amount of cabin sole is to be lifted to permit examination of the bilges and/or tanktops below. (4) All integral tanks are to be cleaned as necessary to permit examination. (For steel yachts, *see* Table 4.4.2). (5) In sailing and auxiliary yachts the sails are to be laid out so that they can be properly examined.	In addition to the requirements for Special Survey I, the following are to be complied with: (1) The chain locker is to be cleared and cleaned internally for examination of the structure and examination of the cable securing arrangements. The chain cables/anchor warps, as applicable, are to be ranged for inspection. The anchors are to be cleaned and placed in an accessible position for inspection. (2) The rudder is to be unshipped for examination of the rudder stock and trunk at the discretion of the Surveyor. For sailing or auxiliary yachts: (3) On yachts fitted with an external ballast keel, fastenings are to be drawn for examination as may be required by the Surveyor. (4) On yachts fitted with a centreplate or lifting keel, the pivot bolts and lifting arrangements are to be dismantled for examination as required by the Surveyor. For wood yachts: (5) Where the hull is sheathed with metal, such sheathing as will permit an examination of the stem, wood keel, garboards, plank ends and sternpost is to be removed as required by the Surveyor. (6) Fastenings are to be drawn as may be required by the Surveyor. (7) The outside surface of the planking is to be scraped bright at the discretion of the Surveyor.	In addition to the requirements for Special Survey II the following are to be complied with: (1) Linings, ceiling/cabin soles, etc. are to be removed as required in order that the Surveyor may be satisfied as to the condition of the structure. For steel yachts: (2) Portions of wood sheathing, or other covering, on steel decks are to be removed, as considered necessary by the Surveyor, in order to ascertain the condition of the plating. (3) Where spaces are insulated, sufficient insulation is to be removed in each space to enable the Surveyors to be satisfied with the condition of the structure. (4) Linings are to be removed in way of shell plating immediately above tank top connections to the side shell, in way of galleys/washrooms and beneath portlights and windows. For sailing or auxiliary yachts: (5) The masts are to be unshipped for survey. The whole of the standing rigging, including rigging screws, bolts, pins and fittings, is to be dismantled as considered necessary by the Surveyor. NOTE This requirement may be waived at alternate Special Surveys provided the masts and rigging are thoroughly examined *in situ*. (6) On yachts fitted with an external ballast keel, a minimum of 50% of the total number of ballast keel fastenings are to be drawn for examination as required by the Surveyor. If defects are found the remaining fastenings should be drawn for sexamination. For wood yachts: (7) Where iron or mild steel fastenings are used, as a minimum requirement the following are to be drawn for examination where applicable: • 6 floor arm fastenings each side. • 4 hanging knee fastenings each side. • 4 chain plate fastenings each side at each mast. • 18 frame to plank fastenings each side. • 12 garboard and 12 plank end fastenings each side.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.3.2 Double bottom compartments, peak tanks and all other integral tanks are to be tested by a head sufficient to give the maximum pressure that can be experienced in service. Tanks may be tested afloat provided that their internal examination is also carried out afloat.

4.3.3 Where repairs are effected to the hull shell or bulkheads, any integral tanks in way are to be tested to the Surveyor's satisfaction on completion of these repairs.

4.3.4 All decks, casings and superstructures are to be examined.

4.3.5 The satisfactory attachment of any wood or other deck sheathing is to be confirmed, *see also* 4.4.4.

4.3.6 Attention is to be given to the corners of openings and other discontinuities in the hull structure.

4.3.7 The anchors are to be examined. If the chain cables are ranged they are to be examined together with the chain locker, *see* Table 4.4.1. If any length of chain cable is found to be reduced in mean diameter at its most worn part by 12 per cent or more from its nominal diameter, it is to be renewed. The windlass is to be examined.

4.3.8 The Surveyor is to be satisfied that there are suitable towlines and mooring ropes when these are a Rule requirement.

4.3.9 Representative structural fastenings, are to be tested to ascertain their soundness and may require to be drawn for examination at the discretion of the Surveyor.

4.3.10 For yachts to which Pt 17, Ch 1 applies, the Surveyor is to be satisfied as to the efficient condition of the means of escape from crew and passenger spaces, and spaces in which crew are normally employed.

4.4 Examination and testing – Additional items for steel yachts

4.4.1 All integral tanks are generally to be internally examined. However, in certain circumstances the internal examination of lubricating oil, fresh water and oil fuel tanks may be waived. For the minimum extent of tank internal examination, *see* Table 4.4.2.

4.4.2 In salt water ballast spaces, integral sanitary tanks and bilges, where the protective coating is found to be other than in GOOD condition as defined in 1.5.6 and it has not been repaired, maintenance of class will be subject to the spaces in question being internally examined and gauged as necessary annually.

4.4.3 The protection of steelwork, other than as referred to in 4.4.2 should be examined and made good where necessary on satisfactory completion of the survey. In areas where the inner surface of the bottom plating is covered with cement, asphalt or other composition, the removal of this covering may be dispensed with, provided that it is found sound and adhering satisfactorily to the steel.

4.4.4 Wood decks or sheathing are to be examined and the caulking is to be tested and recaulked as necessary. If decay or rot is found, or the wood is excessively worn, the wood is to be renewed. When a wood deck, laid on stringers and ties, has worn by 20 per cent or more in thickness, it is to be renewed. Attention is to be given to the condition of the plating under wood deck sheathing or other deck covering. If it is found that such coverings are broken, or are not adhering closely to the plating, sections are to be removed as necessary to ascertain the condition of the plating, *see also* 1.2.1.

4.4.5 The structure in way of bimetallic connections, e.g. to aluminium alloy deckhouses is to be examined.

Table 4.4.2 Tank internal examination requirements for steel yachts

Tank	Special Survey I (Yachts 5 years old)	Special Survey II (Yachts 10 years old)	Special Survey III (Yachts 15 years old)	Special Survey IV (Yachts 20 years old)	All Subsequent Special Surveys
Peaks	All tanks	All tanks	All tanks	All tanks	All tanks
Salt water ballast	All tanks	All tanks	All tanks	All tanks	All tanks
Lubricating oil	None	None	*See* Note 2	*See* Note 3	All tanks
Fresh water	None	*See* Note 1	*See* Note 2	*See* Note 3	All tanks
Oil fuel	None	*See* Note 1	*See* Note 2	*See* Note 3	All tanks
Sanitary	All tanks	All tanks	All tanks	All tanks	All tanks

NOTES
1. Tanks (excluding peak tanks) used exclusively for oil fuel or fresh water need not all be examined internally provided that the Surveyor is satisfied with the condition, after both external examination and testing and from an internal examination of the after end of one forward double bottom tank, and of one selected deep tank.
2. Tanks (excluding peak tanks) used exclusively for oil fuel, oil fuel and fresh water ballast, or lubricating oil, need not all be examined internally provided that the Surveyor is satisfied with the condition, after both external examination and testing and from an internal examination of one double bottom tank forward and one aft and one deep tank.
3. Tanks (excluding peak tanks) used exclusively for oil fuel, oil fuel and fresh water ballast, or lubricating oil, need not all be examined internally provided that the Surveyor is satisfied with the condition, after both external examination and testing and from internal examination of a least one double bottom tank amidships, one forward and one aft and one deep tank.
4. When examining tanks internally the Surveyor is to verify that striking plates or other additional reinforcement is fitted under sounding pipes. In the case of tanks fitted only with remote gauging facilities, the satisfactory operation of the gauges is to be confirmed.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.4.6 The Surveyors may require to measure the thickness of the material in any portion of the structure where signs of wastage are evident or wastage is normally found. Any parts of the structure which are found defective or excessively reduced in scantlings are to be made good by materials of the approved scantlings and quality. The minimum requirements for thickness measurements are given in Section 5.

4.5 Examination and testing – Additional items for aluminium alloy yachts

4.5.1 The structure in way of any bimetallic connections is to be examined and the efficiency of the insulation arrangements confirmed.

4.5.2 The Surveyor may require to measure the thickness of the material in any portion of the structure where signs of deterioration are evident or may normally be found. Any parts of the structure which are found defective or excessively reduced in scantlings are to be made good by materials of the approved scantlings and quality.

4.6 Examination and testing – Additional items for composite yachts

4.6.1 The bonded attachments of frames, floors, bulkheads, structural joinery, engine bearers, sterntubes, rudder tubes, and integral tank boundaries are to be examined.

4.6.2 The hull to deck joint together with any joints between the deck and deckhouses or superstructures are to be examined.

4.6.3 The structure in way of the bolted attachment of fittings including guardrail stanchions, windlass, shaft brackets, fendering, mooring bitts, mast steps, rigging chainplates, etc., is to be examined.

4.7 Examination and testing – Additional items for wood yachts

4.7.1 Where hulls are provided with metal sheathing, the condition of the structure in way of any sheathing is to be confirmed. For the extent of removal of metal sheathing *see* Table 4.4.1. The satisfactory adhesion of any glass/nylon reinforced plastic sheathing is also to be confirmed.

4.7.2 Wood decks or sheathing are to be examined and the caulking is to be tested and re-caulked as necessary. If decay or rot is found or the wood has worn by 20 per cent or more in thickness, the wood is to be renewed. Attention is to be given to the condition of the structure under wood decks, and to fabric deck coverings. If it is found that such coverings are damaged or are not adhering closely to the deck, sections are to be removed as necessary to ascertain the condition of the deck under.

4.7.3 Fastenings as may be required by the Surveyor are to be drawn for examination, see Table 4.4.1.

4.8 Examination and testing – Additional items for sailing and auxiliary yachts

4.8.1 The mast(s), mast steps, spars, standing and running rigging, rigging screws, chainplates and sails are to be examined, *see* Table 4.4.1.

4.8.2 The structure in way of the attachment of bilge or centreline ballast keels is to be examined. Ballast keel bolts are to be tested to ascertain their soundness and may require to be drawn for examination, *see* Table 4.4.1.

4.8.3 On yachts fitted with a centreplate or lifting keel, the pivot bolt and lifting arrangements are to be examined as far as is practicable.

■ *Section 5*
Special Survey – Thickness measurement requirements for steel yachts

5.1 General

5.1.1 Thickness measurements, as required by Section 4 are to be carried out in accordance with the following requirements.

5.1.2 Thickness measurements are to be taken at the forward and aft areas of all plates. In all cases the measurements are to represent the average of the multiple measurements taken on each plate. The extent of local substantial corrosion of plates is to be established by intensive measurement in the affected areas. Where measured plates are renewed, the thicknesses of adjacent plates in the same strake are to be reported.

5.1.3 Thickness measurements are normally to be by means of ultrasonic test equipment and are to be carried out by a firm qualified as Grade 1 or Grade 2 according to LR's *Approval for Thickness Measurement of Hull Structures* or by the Surveyor.

5.1.4 The degree of supervision or check testing by the Surveyor is dependent upon the grade of approval extended to the firm carrying out the thickness measurements:

(a) The work of firms having Grade 1 approval is subject to check testing by the Surveyor.

(b) Thickness measurements by firms having Grade 2 approval is to be carried out with the Surveyor substantially in attendance.

5.1.5 Thickness measurements may be carried out in association with the fourth Annual Survey.

5.1.6 The minimum requirements for thickness measurement are indicated in Table 4.5.1.

5.1.7 The Surveyor may extend the scope of thickness measurement if deemed necessary.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 4.5.1 Thickness measurement of steel yachts

Special Survey I (Yachts 5 years old)	Special Survey II (Yachts 10 years old)	Special Survey III (Yachts 15 years old)	Special Survey IV and subsequent (Yachts 20 years old and over)
Suspect areas, as required by the Surveyor and may include areas where the coatings are found to be other than in GOOD condition, *see* Note 1.	Suspect areas, as required by the Surveyor and may include areas where the coatings are found to be other than in GOOD condition, *see* Note 1.	(1) Any exposed plating throughout the Main Deck. (2) Shell plating in way of the waterline throughout the length of the craft. (3) Suspect areas, as required by the Surveyor may include areas where the coatings are found to be other than in GOOD condition, *see* Note 1.	(1) All Main Deck plating outside deckhouses or superstructures and including plating in way of wood deck planking or sheathing. (2) Shell plating in way of, and below, the waterline throughout the length of the craft. (3) 2 transverse sections of deck and shell plating within 0,5*L* amidships. (4) Suspect areas, as required by the Surveyor and to include as applicable: (a) Areas where the coatings are found to be other than in GOOD condition. (b) Shell and tanktop plating immediately adjacent to tank top margins. (c) Bottom shell in way of any cement, asphalt or other composition. (d) Shell plating below portlights and windows. (e) Tanktop plating below ceiling or cabin soles. (f) Deck plating and side shell plating in way of galleys, washrooms and refrigerated store spaces. (g) Structure in way of integral sanitary tanks.

NOTES
1. Suspect areas are locations within the hull structure vulnerable to increased likelihood of structural deterioration and may include, for steel hulls, areas of substantial corrosion and/or fatigue cracking, *see also* 1.5.3 and 4.4.6.
2. Coating condition for steel craft is defined in 1.5.6.

5.2 Thickness measurement reporting

5.2.1 A report is to be prepared by the approved firm carrying out the thickness measurement. The report is to give the location of measurement, the thickness measured as well as the corresponding original thickness. The report is to give the date when the measurement was carried out, the type of measuring equipment, names of personnel and their qualifications and is to be signed by the operator and supervisor.

5.2.2 The thickness measurement report is to be verified and signed by the Surveyor.

■ *Section 6* Machinery surveys – General requirements

6.1 Intermediate and Docking Surveys

6.1.1 For Intermediate and Docking Surveys, *see* Sections 2 and 3.

6.1.2 For yachts where an Approved Planned Maintenance Scheme is in operation an Annual Survey of the machinery is to be carried out together with an audit of the maintenance and monitoring records.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

6.2 Complete Surveys

6.2.1 While the yacht is in dry-dock, all openings to the sea in the machinery spaces and pump-rooms, together with the valves, cocks and the fastenings with which these are connected to the hull, are to be examined. For athwartships thrust propellers, *see* 10.1.8.

6.2.2 Athwartships thrust propellers are to be generally examined as far as is possible in dry dock and tested under working conditions afloat for satisfactory operation.

6.2.3 All shafts (except screwshafts and tube shafts, for which special arrangements are detailed in Section 10), thrust block and all bearings are to be examined. The lower halves of bearings need not be exposed if alignment and wear are found to be acceptable.

6.2.4 An examination is to be made as far as practicable of all propulsion gears complete with all wheels, pinions, shafts, bearings and gear teeth, thrust bearings and incorporated clutch arrangements.

6.2.5 The following auxiliaries and components are also to be examined:

(a) Auxiliary engines, auxiliary air compressors with their intercoolers, filters and/or oil separators and safety devices, and all pumps and components used for essential services.
(b) Steering machinery.
(c) Windlass and associated driving equipment, where fitted.
(d) The holding down bolts, chocks or resilient mounts of main and auxiliary engines, gearcases, thrust blocks and intermediate shaft bearings.

6.2.6 All air receivers for essential services, together with their mountings, valves and safety devices, are to be cleaned internally and examined internally and externally. If internal examination of the air receivers is not practicable, they are to be tested hydraulically to 1,3 times the working pressure.

6.2.7 The valves, cocks and strainers of the bilge system including bilge injection, are to be opened up as considered necessary by the Surveyor and together with pipes, are to be examined and tested under working conditions. The oil fuel, feed, lubricating oil and cooling water systems also any ballast connections together with all pressure filters, heaters and coolers used for essential services, are to be opened up and examined or tested, as considered necessary by the Surveyor. All safety devices for the foregoing items are to be examined.

6.2.8 Fuel tanks which do not form part of the yacht's structure are to be examined, and if considered necessary by the Surveyor, they are to be tested to the pressure specified for new tanks. The tanks need not be examined internally at the first survey if they are found satisfactory on external inspection. The mountings, fittings and remote controls of all oil fuel tanks are to be examined, so far as is practicable.

6.2.9 Where remote and/or automatic controls are fitted for essential machinery, they are to be tested to demonstrate that they are in good working order.

6.2.10 In addition to the above, detailed requirements for gas turbines and oil engines and electrical installations are given in Sections 7, 8 and 9 respectively. In certain instances, upon application by the Owner or where indicated by the maker's servicing recommendations, the Committee will give consideration to the circumstances where deviation from these detailed requirements is warranted, taking account of design, appropriate indicating equipment (e.g. vibration indicators) and operational records, *see* Ch 2,4.5.17 and 4.5.23.

■ *Section 7*
Gas turbines – Detailed requirements

7.1 Complete Surveys

7.1.1 The requirements of Section 6 are to be complied with. *See* 6.2.10 regarding any deviation from the following.

7.1.2 The following parts are to be opened out and examined:

- Compressor including impellers or blading, rotors and casing.
- Combustion chambers, burners, intercoolers and heat exchangers.
- Gas, air and fuel piping and fittings.
- Gas generator turbine and power turbine blading, rotors and casing.
- Rotors to include couplings, clutches, bearings and tie bolts.
- Auxiliary mounted fuel, L.O. and cooling water pumps, their drive transmissions and fittings.
- Starting system (for starting air pipes, *see* 8.1.3).
- All safety devices and local controls.
- Mountings and support frame.

7.1.3 The compressor/turbine units are to be operated and maintained in accordance with the manufacturer's instructions. Overhauls, including the prescribed replacement of limited life components, are to be undertaken at the specified intervals. Full service records are to be available for review by the Surveyor.

7.1.4 The manoeuvring of the propulsion system is to be tested under working conditions.

■ *Section 8*
Oil engines – Detailed requirements

8.1 Complete Surveys

8.1.1 The requirements of Section 6 are to be complied with. *See* 6.2.10 regarding any deviation from the following.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

8.1.2 The following parts are to be opened out and examined:

- Cylinders and covers.
- Valves and valve gear.
- Pistons and connecting rods.
- Crankshafts and all bearings
- Crankcases and entablatures.
- Crankcase door fastenings and explosion relief devices.
- Turbo-chargers and their associated coolers.
- Air compressors and their intercoolers.
- Filters and/or separators and safety devices.
- Fuel pumps and fittings.
- Camshaft drives and balancer units.
- Vibration dampers or detuners.
- Flexible couplings and clutches.
- Reverse gears.
- Attached pumps and cooling arrangements.

8.1.3 Selected pipes in the starting air system, if fitted, are to be removed for internal examination and are to be hammer tested. If any appreciable amount of lubricating oil is found in the pipes, the starting air system is to be thoroughly cleaned internally by steaming out, or other suitable means. Some of the pipes selected are to be those adjacent to the starting air valves at the cylinders and to the discharges from the air compressors.

8.1.4 The electric ignition system, if fitted, is to be examined and tested.

8.1.5 The manoeuvring of engines is to be tested under working conditions. Initial starting arrangements are to be tested.

■ *Section 9*
Electrical equipment

9.1 Intermediate Surveys

9.1.1 The requirements of 2.2.9 and 2.2.13 are to be complied with as far as applicable.

9.2 Complete Surveys

9.2.1 An electrical insulation resistance test is to be made on the electrical equipment and cables. The installation may be sub-divided or equipment, which may be damaged, disconnected for the purpose of this test.

9.2.2 The fittings on the main and emergency switch-boards, section boards and distribution boards are to be examined and over-current protective devices and fuses inspected to verify that they provide suitable protection for their respective circuits.

9.2.3 Generator circuit-breakers are to be tested, so far as is practicable, to verify that protective devices including preference tripping relays, if fitted, operate satisfactorily.

9.2.4 The electric cables and their securing arrangements are to be examined, so far as is practicable, without undue disturbance of fixtures or casings unless opening up is considered necessary as a result of observation or of the tests required by 9.2.1.

9.2.5 The generator prime movers are to be surveyed as required by Sections 7 and 8 and the governing of the engines tested. The motors concerned with essential services together with associated control and switch gear are to be examined and if considered necessary, are to be operated, so far as is practicable, under working conditions. All generators and steering gear motors are to be examined and are to be operated under working conditions, though not necessarily under full load or simultaneously.

9.2.6 Where transformers or electrical apparatus associated with supplies to essential services are liquid filled or cooled by a liquid in direct contact with current carrying parts, the owner is to arrange for samples of the liquid to be taken and tested, by a competent authority, in accordance with the equipment manufacturer's requirements, and a certificate giving the test results is to be furnished to the Surveyor.

9.2.7 Navigation light indicators are to be tried under working conditions, and correct operation on the failure of supply or failure of navigation lights verified.

9.2.8 The emergency sources of electrical power, where fitted, together with their automatic arrangements and associated circuits are to be tested.

9.2.9 Emergency lighting, transitional emergency lighting, supplementary emergency lighting, general emergency alarm and public address systems are to be tested as far as practicable.

9.2.10 Where the yacht is electrically propelled, the propulsion motors, generators, cables and all ancillary electrical gear, exciters and ventilating plant (including coolers) associated therewith are to be examined, and the insulation resistance to earth is to be tested. Special attention is to be given to windings, commutators and slip-rings. The operation of protective gear and alarm devices is to be checked, so far as is practicable. Liquids for filling and cooling, if used, are to be tested in accordance with 9.2.6. Interlocks intended to prevent unsafe operations or unauthorised access are to be checked to verify that they are functioning correctly. Emergency overspeed governors are to be tested.

9.2.11 Where batteries provide the source of power for any essential services, their installation, including charging and ventilation, is to be examined.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Section 10
Screwshafts, tube shafts, propellers and water jet units

10.1 Frequency of surveys

10.1.1 Shafts with keyed propeller attachments and fitted with continuous liners or approved oil glands, or made of approved corrosion resistant materials, are to be surveyed at intervals of five years when the keyway complies fully with the present Rules.

10.1.2 Shafts having keyless type propeller attachments are to be surveyed at intervals of five years provided they are fitted with approved oil glands or are made of approved corrosion resistant materials.

10.1.3 Shafts having solid coupling flanges at the after end are to be surveyed at intervals of five years provided they are fitted with approved oil glands or are made of approved corrosion resistant materials.

10.1.4 All other shafts not covered by 10.1.1 to 10.1.3 are to be surveyed at intervals of $2^1/_2$ years.

10.1.5 Controllable pitch propellers for main propulsion purposes are to be surveyed at the same intervals as the screwshaft.

10.1.6 Directional propeller units for main propulsion purposes are to be surveyed at intervals not exceeding five years.

10.1.7 Water jet units for main propulsion purposes are to be surveyed at intervals not exceeding five years provided the impeller shafts are made of approved corrosion resistant material or have approved equivalent arrangements.

10.1.8 Athwartship thrust propellers and shaftings are to be surveyed at intervals not exceeding five years, *see* 6.2.2.

10.2 Normal surveys

10.2.1 All screwshafts are to be withdrawn for examination by LR's Surveyors at the intervals prescribed in 10.1.1 to 10.1.4. The after end of the cylindrical part of the shaft and forward one third of the shaft cone, or fillet of the flange, is to be examined by a magnetic particle crack detection method. In the case of a keyed propeller attachment at least the forward one third of the shaft cone is to be examined with the key removed. Weardown is to be measured and the sterntube bearings, oil glands, propellers and fastenings are to be examined. Controllable pitch propellers where fitted are to be opened up and the working parts examined, together with the control gear.

10.2.2 Directional propeller units are to be dismantled for examination of the propellers, shafts, gearing and control gear.

10.2.3 Water jet units are to be dismantled for examination of the impeller, casing, shaft, shaft seal, shaft bearing, inlet and outlets channels, steering nozzle, reversing arrangements, and control gear.

10.3 Screwshaft Condition Monitoring (SCM)

10.3.1 Where oil lubricated shafts with approved oil glands are fitted, and the Owner has complied with the following requirements, the descriptive note **SCM** (Screwshaft Condition Monitoring) may be assigned:

(a) Lubricating oil analysis to be carried out regularly at intervals not exceeding six months. The lubricating oil analysis documentation is to be available on board. Each analysis is to include the following minimum parameters:
- water content
- chloride content
- bearing material and metal particles content
- oil ageing (resistance to oxidation).

(b) Oil samples are to be taken under service conditions and are to be representative of the oil within the sterntube.

(c) Oil consumption is to be recorded.

(d) Bearing temperatures are to be recorded, (two temperature sensors or other approved arrangements are to be provided).

(e) Facilities are to be provided for measurement of bearing weardown.

(f) Oil glands are to be capable of being replaced without withdrawal of the screwshaft.

10.3.2 For maintenance of the descriptive note **SCM**, the records of analyses, consumption and temperatures, together with weardown readings are to be retained on board and audited annually.

10.3.3 Where the requirements for the descriptive note **SCM** have been complied with, the screwshaft need not be withdrawn at surveys as required by 10.2.1 provided all condition monitoring data is found to be within permissible limits and all exposed areas of the shaft are examined by a magnetic particle crack detection method. The remaining requirements of 10.2.1 are to be complied with. Where the Surveyor considers that the data presented is not entirely to his satisfaction the shaft will be required to be withdrawn in accordance with 10.2.1.

10.4 Modified Survey

10.4.1 A Modified Survey may be accepted at alternate five-yearly surveys for shafts described in 10.1.1 provided they are fitted with oil lubricated bearings and approved oil glands, and also for those in 10.1.2 and 10.1.3.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

10.4.2 The Modified Survey is to consist of the partial withdrawal of the shaft, sufficient to ascertain the condition of the stern bearing and shaft in way. For keyless propellers or shafts with a solid flange connection to the propeller a visual examination to confirm the good condition of the sealing arrangements is to be made. The oil glands are to be capable of being replaced without removal of the propeller. The forward bearing and all accessible parts including the propeller connection to the shaft are to be examined as far as possible.

Wear-down is to be measured and found satisfactory. Where a controllable pitch propeller is fitted, at least one of the blades is to be dismantled complete for examination of the working parts and the control gear.

10.4.3 For keyed propellers, the after end of the cylindrical part of the shaft and forward one third of the shaft cone is to be examined by a magnetic particle crack detection method, for which dismantling of the propeller and removal of the key will be required.

10.4.4 Where the descriptive note **SCM** has been assigned as described in 10.3.1 and all data is found to be within permissible limits, partial withdrawal of the shaft may not be required. Where doubt exists regarding any of the above findings the shaft is to be withdrawn to permit an entire examination.

10.5 Partial Survey

10.5.1 For shafts where the Modified Survey is applicable, upon application by the Owner, the Committee will be prepared to give consideration to postponement of the survey for a maximum period of half the specified cycle provided a Partial Survey is held.

10.5.2 The Partial Survey is to consist of the propeller being backed off in any keyed shaft and the top half of the cone examined by an efficient crack detection method for which removal of the key will be required. Oil gland and seals are to be examined and dealt with as necessary. Weardown is to be measured and found satisfactory. Propeller and fastenings are to be examined.

10.5.3 The Committee will be prepared to give consideration to the circumstances of any special case upon application by the Owner.

■ *Section 11*
Surveys of unclassed machinery in existing classed yachts

11.1 General

11.1.1 The requirements of this survey are considered necessary in order to establish, so far as practicable, that the unclassed machinery installation does not constitute a hazard to the classed hull. The survey is applicable only to existing sailing yachts fitted with unclassed auxiliary propulsion engines not exceeding 37 kW.

11.1.2 At any time when unclassed machinery in an existing classed yacht is undergoing alteration and/or replacement, the requirements of Ch 2,4.4.6 are to be complied with.

11.2 Intermediate and Docking Surveys

11.2.1 For Intermediate and Docking Surveys, *see* Sections 2 and 3.

11.3 Complete Surveys

11.3.1 At each Special Survey of the hull the requirements of 11.2.1 and the following are to be complied with:

(a) The bilge pumping system is to be examined and tested under working conditions.
(b) A general examination is to be made of the fuel tanks and fuel system with their valves, pipes and fittings, and of the engine exhaust system, piping and fittings.
(c) A general examination of the electrical equipment is to be made and, if considered necessary, a test of the insulation resistance is to be carried out in accordance with 9.2.1.
(d) The starting arrangements are to be examined.
(e) The screwshafts and tube shafts are to be withdrawn for examination.
(f) The main and essential auxiliary machinery is to be examined under full working conditions in accordance with 8.1.4.

■ *Section 12*
Classification of yachts not built under survey

12.1 General

12.1.1 When classification is desired for a yacht not built under the supervision of LR's Surveyors, application should be made to the Committee in writing.

12.1.2 Periodical Surveys of such yachts, when classed, are subsequently to be held as in the case of yachts built under survey.

12.1.3 Where classification is desired for a yacht which is classed by another recognised Society, special consideration will be given to the scope of the survey.

12.2 Hull and equipment

12.2.1 Plans showing the main scantlings and arrangements of the actual yacht together with any proposed alterations are to be submitted for approval.These should comprise plans of the midship section, longitudinal section and decks, and such other plans as may be requested. If plans cannot be obtained or prepared by the Owner, facilities are to be given for LR's Surveyor to obtain the necessary information from the yacht.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

12.2.2 Particulars of the process of manufacture and the testing of the material of construction are to be supplied. The requirements for composite yachts will be specially considered.

12.2.3 The full requirements of Sections 4 and 5 are to be carried out as applicable. Yachts of recent construction will receive special consideration.

12.2.4 During the survey, the Surveyors are to satisfy themselves regarding the workmanship and verify the approved scantlings and arrangements. For this purpose, and also in order to ascertain the amount of any deterioration of steel yachts, parts of the structure will require to be gauged as necessary. Full particulars of the anchors, chain cables and equipment are to be submitted. For yachts to which Pt 17, Ch 1 applies, fire protection, detection and extinction are to be in accordance with the Rules.

12.2.5 When the full survey requirements indicated in 12.2.3 and 12.2.4 cannot be completed at one time, the Committee may consider granting an interim record for a limited period. The conditions regarding the completion of the survey will depend on the merits of each particular case, which should be submitted for consideration.

12.3 Machinery

12.3.1 To facilitate the survey, the following plans and particulars (plans of piping are to be diagrammatic), together with the particulars of the materials used in the construction of any boilers, air receivers and important forgings are to be submitted:

- Name of manufacturer of engine and gearbox including the manufacturer's type designation of engine and gearbox, together with the continuous shaft power of the engine at the crankshaft coupling with the revolutions per minute of crankshaft and propeller.
- General pumping arrangements, including air and sounding pipes (Builder's plan).
- Bilge, ballast and oil fuel pumping arrangements including the capacities of the pumps on bilge service.
- Arrangement and dimensions of any steam pipes.
- Arrangement of oil fuel pipes and fittings at settling and service tanks.
- Arrangement of oil fuel piping in connection with oil burning installations.
- Oil fuel overflow systems, where these are fitted.
- Arrangement of boiler feed systems.
- Oil fuel settling, service and other oil fuel tanks not forming part of the craft's structure.
- Boilers and economisers.
- Air receivers.
- Crank, thrust, intermediate and screw shafting.
- Details of water jet or directional propeller units, if fitted.
- Clutch and reversing gear with methods of control.
- Reduction gearing.
- Propeller (including spare propeller if supplied) where the diameter exceeds 1m.
- Electrical circuits.
- Arrangement of compressed air systems for main and auxiliary services.
- Arrangement of lubricating oil, other flammable liquids and cooling water systems for main and auxiliary services.
- Steering gear including control arrangement.
- Arrangement of exhaust system indicating materials, method of cooling, and if water spray injected, the method of draining.

12.3.2 Plans additional to those detailed in 12.3.1 are not to be submitted unless the machinery is of a novel or special character affecting classification.

12.3.3 Where remote and/or automatic controls are fitted to propulsion machinery and essential auxiliaries, a description of the scheme is to be submitted.

12.3.4 For new yachts and yachts which have been in service less than two years, calculations of the torsional vibration characteristics of the propelling machinery are to be submitted for consideration, as required for yachts constructed under Special Survey. For older yachts the circumstances will be specially considered in relation to their service record and type of machinery installed. Where calculations are not submitted, the Committee may require that the machinery certificate be endorsed to this effect. When desired by the Owner, the calculations and investigation of the torsional vibration characteristics of the machinery may be carried out by LR upon special request.

12.3.5 The main and auxiliary machinery, feed pipes, compressed air pipes and boilers are to be examined as required at Complete Surveys. Working pressures are to be determined from the actual scantlings in accordance with the Rules.

12.3.6 The screwshaft is to be drawn and examined.

12.3.7 Any steam pipes or oil burning installations are to be examined and tested as required by Pt 1, Ch 3,15 or Ch 3,16 of the *Rules and Regulations for the Classification of Ships*.

12.3.8 The bilge, ballast and oil fuel pumping arrangements are to be examined and amended, as necessary, to comply with the Rules.

12.3.9 The electrical equipment is to be examined as required at Complete Surveys.

12.3.10 The whole of the machinery, including essential controls, is to be tried under working conditions to the Surveyor's satisfaction.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Periodical Survey Regulations for Amphibious Air Cushion Vehicles (ACV)

Section

1 **General**

2 **Annual Surveys – Hull and machinery requirements**

3 **Intermediate Surveys – Hull and machinery requirements**

4 **Special Surveys (Hull and machinery)**

5 **Classification of ACVs not built under survey**

■ *Section 1* General

1.1 Frequency of surveys

1.1.1 Except as amended at the discretion of the Committee, the periods between surveys are as follows:

(a) Annual Surveys are to be held within three months before or after each anniversary of the completion, commissioning or Special Survey.

(b) Intermediate Surveys are to be held instead of the second or third Annual Survey after completion, commissioning or Special Survey.

(c) Special Surveys (hull and machinery) are to be held at the fifth anniversary after completion, commissioning or previous Special Survey.

1.2 Machinery surveys

1.2.1 The manufacturer's approved operating and service instructions for the main and auxiliary power units, transmission systems, propellers and lift fans are to be incorporated into an approved planned maintenance scheme for the ACV.

1.2.2 Maintenance, overhaul or replacement will then normally be determined by the specified condition/performance monitoring limits and running hours.

1.2.3 It is a requirement of this arrangement that any significant defect, damage repair or alteration be reported to Lloyd's Register (hereinafter referred to 'LR') without delay, *see also* Ch 2,1.1.7.

1.3 Surveys for damage, repairs or alterations

1.3.1 At any time when an ACV is undergoing alterations or damage repairs, any exposed parts of the structure normally difficult to access are to be specially examined, e.g. if any part of the main or auxiliary machinery is removed for any reasons, the hull structure in way is to be carefully examined by the Surveyor.

1.3.2 All significant repairs, alterations, approved modifications and replacements are to be recorded in the ACV's Log Books in a manner that will enable their later identification by the Surveyors, *see also* Ch 2,4.4.1 and 4.4.6.

1.3.3 Trials are to be made on any craft which have been significantly modified, overhauled or repaired, prior to returning to service, to ensure to the Surveyor's satisfaction that the ACV has been returned in a satisfactory condition for its intended service.

1.4 Unscheduled surveys

1.4.1 In the event that LR has cause to believe that its Rules and Regulations are not being complied with, LR reserves the right to perform unscheduled surveys of the hull or machinery.

1.5 Surveys for the issue of Convention Certificates

1.5.1 Surveys are to be held either by LR when so appointed or by the Exclusive Surveyors of a National Administration when so delegated by a Flag State.

■ *Section 2* Annual Surveys – Hull and machinery requirements

2.1 General

2.1.1 Annual Surveys are to be held concurrently with any relevant statutory annual or other statutory surveys, wherever practicable.

2.1.2 The Surveyor is to audit the approved planned maintenance scheme. The records will be checked and the satisfactory operation of the scheme verified. Condition monitoring data will be reviewed and trends analysed.

2.1.3 The Surveyor is to examine the Log Book to verify that a proper record has been kept in respect of servicing, maintenance and overhaul requirements for those aspects not covered by the approved planned maintenance scheme.

2.1.4 Certification for replacement units/parts will be required.

2.2 Preparation

2.2.1 The ACV is to be slung or jacked up to permit a thorough inspection of all underside parts, fittings and attachments.

2.2.2 Panelling, floor coverings, etc. need not be removed at these surveys, unless they are of portable type or unless the Surveyor has reason to suspect they may conceal significant damage.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2.3 Hull items

2.3.1 The Surveyor is to be satisfied as to the efficient condition of the following items:

(a) Bottom and side plating, any external stiffeners, and side walls or skirts, including flexible keels, if any.
(b) Weather doors, ventilators, windows and emergency or other hatches.
(c) Weather decks, houses, etc.
(d) Machinery casings and seats.
(e) Anchoring and mooring equipment when required by the Rules.
(f) Fire equipment including fire detection, alarm systems and means of escape , where the survey of such items is not covered by statutory certification.
(g) Where applicable, passenger seat foundations and cargo tie down points.
(h) Skirt attachment and operating mechanisms.
(j) Air propeller shroud structures.
(k) Side body attachments and supports (when fitted).
(l) Operation of ramps, and their closing and locking arrangements.
(m) The structural attachment and retention arrangements for external fuel tanks (when fitted).

2.4 Machinery items

2.4.1 The Surveyor is to be satisfied as to the efficient condition of the following items:

(a) Fuel tanks and associated fuel system with pumps, filters, etc.
(b) Lubricating oil tanks and associated lubricating system with coolers, pumps, filters, etc.
(c) The bilge pumping system.
(d) Machinery alarm arrangements.
(e) The electrical machinery, the switchgear and other electrical equipment are to be generally examined under operating conditions so far as practicable. The satisfactory operation of the emergency source of power, including the automatic controls as fitted, is to be verified.
(f) Hydraulic, electrical and pneumatic control systems, including steering, are to be examined under operating conditions.
(g) Engine starting arrangements.
(h) All drive belts, associated running surfaces and tension adjustment (where fitted).
(j) Air propellers, including (where fitted) hub assemblies, servos and actuating equipment of controllable pitch propellers.
(k) The overall operation of the machinery including propulsion and lift machinery. A machinery proving trial of short duration is to demonstrate to the Surveyor the satisfactory operation of the machinery.

■ *Section 3*
Intermediate Surveys – Hull and machinery requirements

3.1 General

3.1.1 The requirements of Section 2 are to be complied with.

3.2 Preparation

3.2.1 A sufficient amount of panelling, floor covering, insulation and paint etc., is to be removed to enable the Surveyors to satisfy themselves that all major structural items are in a satisfactory condition.

3.3 Examination and testing

3.3.1 Representative integral tanks and buoyancy spaces are to be examined as necessary to ensure that they continue to be in a satisfactory condition.

3.3.2 At the discretion of the Surveyor, tanks or buoyancy spaces may require to be tested to ensure that they continue to be tight.

■ *Section 4*
Special Surveys (Hull and machinery)

4.1 General

4.1.1 The requirements of Sections 2 and 3 are to be complied with.

4.2 Hull Surveys

4.2.1 All integral tanks and buoyancy spaces are to be examined and tested to ensure that they continue to be tight and in a satisfactory condition.

4.2.2 All other hull compartments are to be examined.

4.2.3 The anchoring and mooring equipment, when required by the Rules, is to be examined to ensure its efficiency, accessibility and readiness for use. Anchor cables or warps are to be ranged for examination.

4.3 Machinery Surveys

4.3.1 The main and essential auxiliary machinery is to be generally examined with particular attention given to safety devices, fastening arrangements and resilient mountings. A limited opening up, e.g. removal of inspection covers, should be undertaken in order that the Surveyor can confirm the satisfactory condition of these items.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.3.2 Where not carried out as a regular monitoring procedure, lubricating oil analysis may be required.

4.3.3 Items that have not been overhauled as part of the approved planned maintenance scheme since installation, commissioning or the previous Special Survey may require to be opened up for examination.

4.3.4 The insulation resistance of the electrical equipment and connections is to be tested.

■ *Section 5* Classification of ACVs not built under survey

5.1 General

5.1.1 The requirements for classification of an ACV not built under the supervision of LR's Surveyors are to be in accordance with the applicable sub-Sections of Pt 1, Ch 3,12.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

A guide to the Rules

and published requirements

Rules for the Manufacture, Testing and Certification of Materials

Introduction

The Rules are published as a complete set; individual Parts are, however, available on request. A comprehensive List of Contents is placed at the beginning of each Part.

Numbering and Cross-References

A decimal notation system has been adopted throughout. Five sets of digits cover the divisions, i.e. Part, Chapter, Section, sub-Section and paragraph. The textual cross-referencing within the text is as follows, although the right hand digits may be added or omitted depending on the degree of precision required:

(a) In same Chapter, e.g. *see* 2.1.3 (i.e. down to paragraph).

(b) In another set of Lloyd's Register Rules, e.g. *see* Pt 5, Ch 3,2.1 of the Rules and Regulations for the Classification of Ships.

The cross-referencing for Figures and Tables is as follows:

(a) In same Chapter, e.g. as shown in Fig. 2.3.5 (i.e. Chapter, Section and Figure Number).

(b) In another set of Lloyd's Register Rules, e.g. *see* Table 2.7.1 in Pt 3, Ch 2 of the Rules and Regulations for the Classification of Special Service Craft.

Rules updating

The Rules are generally published annually and changed through a system of Notices. Subscribers are forwarded copies of such Notices when the Rules change.

Current changes to Rules that appeared in Notices are shown with a black rule alongside the amended paragraph on the left hand side. A solid black rule indicates amendments and a dotted black rule indicates corrigenda.

July 2011

Lloyd's Register is an exempt charity under the UK Charities Act 1993

Lloyd's Register, its affiliates and subsidiaries and their respective officers, employees or agents are, individually and collectively, referred to in this clause as the 'Lloyd's Register Group'. The Lloyd's Register Group assumes no responsibility and shall not be liable to any person for any loss, damage or expense caused by reliance on the information or advice in this document or howsoever provided, unless that person has signed a contract with the relevant Lloyd's Register Group entity for the provision of this information or advice and in that case any responsibility or liability is exclusively on the terms and conditions set out in that contract.

CHAPTER 4 STEEL CASTINGS

Section 1 General requirements
1.1 Scope
1.2 Manufacture
1.3 Quality of castings
1.4 Chemical composition
1.5 Heat treatment
1.6 Test material and test specimens
1.7 Visual and non-destructive examination
1.8 Pressure testing
1.9 Rectification and dressing of castings
1.10 Identification of castings
1.11 Certification of materials

Section 2 Castings for ship and other structural applications
2.1 Scope
2.2 Chemical composition
2.3 Heat treatment
2.4 Mechanical tests
2.5 Non-destructive examination
2.6 Acceptance levels for surface crack detection

Section 3 Castings for machinery construction
3.1 Scope
3.2 Chemical composition
3.3 Heat treatment
3.4 Mechanical tests
3.5 Non-destructive examination

Section 4 Castings for crankshafts
4.1 Scope
4.2 Manufacture
4.3 Chemical composition
4.4 Heat treatment
4.5 Mechanical tests
4.6 Non-destructive examination
4.7 Rectification of defective castings

Section 5 Castings for propellers
5.1 Scope
5.2 Chemical composition
5.3 Heat treatment
5.4 Mechanical tests
5.5 Non-destructive examination
5.6 Rectification of defective castings
5.7 Identification
5.8 Certification of materials

Section 6 Castings for boilers, pressure vessels and piping systems
6.1 Scope
6.2 Chemical composition
6.3 Heat treatment
6.4 Mechanical tests
6.5 Non-destructive examination
6.6 Mechanical properties for design purposes

Section 7 Ferritic steel castings for low temperature service
7.1 Scope
7.2 Chemical composition
7.3 Heat treatment
7.4 Mechanical tests
7.5 Non-destructive examination

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Contents

Section 8 Stainless steel castings
8.1 Scope
8.2 Chemical composition
8.3 Heat treatment
8.4 Mechanical tests
8.5 Intergranular corrosion tests
8.6 Non-destructive examination

Section 9 Steel castings for container corner fittings
9.1 General
9.2 Chemical composition
9.3 Heat treatment
9.4 Mechanical tests
9.5 Non-destructive examination
9.6 Repair of defects
9.7 Identification
9.8 Certification of materials

CHAPTER 5 STEEL FORGINGS

Section 1 General requirements
1.1 Scope
1.2 Manufacture
1.3 Quality
1.4 Chemical composition
1.5 Heat treatment
1.6 Test material
1.7 Mechanical tests
1.8 Visual and non-destructive examination
1.9 Rectification of defects
1.10 Identification
1.11 Certification of materials

Section 2 Forgings for ship and other structural applications
2.1 Scope
2.2 Chemical composition
2.3 Heat treatment
2.4 Mechanical tests
2.5 Non-destructive examination

Section 3 Forgings for shafting and machinery
3.1 Scope
3.2 Chemical composition
3.3 Heat treatment
3.4 Mechanical tests
3.5 Non-destructive examination

Section 4 Forgings for crankshafts
4.1 Scope
4.2 Manufacture
4.3 Chemical composition
4.4 Heat treatment
4.5 Mechanical tests
4.6 Non-destructive examination

Section 5 Forgings for gearing
5.1 Scope
5.2 Manufacture
5.3 Chemical composition
5.4 Heat treatment
5.5 Mechanical tests for through hardened, induction hardened or nitrided forgings
5.6 Mechanical tests for carburised forgings
5.7 Non-destructive examination

Section 7 Forgings for boilers, pressure vessels and piping systems
7.1 Scope
7.2 Chemical composition
7.3 Heat treatment
7.4 Mechanical tests
7.5 Non-destructive examination
7.6 Pressure tests
7.7 Mechanical properties for design purposes

Section 8 Ferritic steel forgings for low temperature service
8.1 Scope
8.2 Chemical composition
8.3 Heat treatment
8.4 Mechanical tests
8.5 Non-destructive examination
8.6 Pressure tests

Section 9 Austenitic stainless steel forgings
9.1 General
9.2 Mechanical properties for design purposes
9.3 Non-destructive examination
9.4 Intergranular corrosion tests

CHAPTER 6 STEEL PIPES AND TUBES

Section 1 General requirements
1.1 Scope
1.2 Manufacture
1.3 Quality
1.4 Dimensional tolerances
1.5 Chemical composition
1.6 Heat treatment
1.7 Test material
1.8 Dimensions of test specimens and test procedures
1.9 Visual and non-destructive testing
1.10 Hydraulic test
1.11 Rectification of defects
1.12 Identification
1.13 Certification of materials

Section 2 Seamless pressure pipes
2.1 Scope
2.2 Manufacture and chemical composition
2.3 Heat treatment
2.4 Mechanical tests
2.5 Mechanical properties for design

Section 3 Welded pressure pipes
3.1 Scope
3.2 Manufacture and chemical composition
3.3 Heat treatment
3.4 Mechanical tests
3.5 Mechanical properties for design

5.2 Manufacture and chemical composition
5.3 Heat treatment
5.4 Mechanical tests
5.5 Intergranular corrosion tests
5.6 Fabricated pipework
5.7 Certification of materials

Section 6 Boiler and superheater tubes
6.1 Scope
6.2 Manufacture and chemical composition
6.3 Heat treatment
6.4 Mechanical tests
6.5 Mechanical properties for design

CHAPTER 7 IRON CASTINGS

Section 1 General requirements
1.1 Scope
1.2 Manufacture
1.3 Quality of castings
1.4 Chemical composition
1.5 Heat treatment
1.6 Test material
1.7 Mechanical tests
1.8 Visual and non-destructive examination
1.9 Rectification of defective castings
1.10 Pressure testing
1.11 Identification of castings
1.12 Certification of materials

Section 2 Grey iron castings
2.1 Scope
2.2 Test material
2.3 Mechanical tests

Section 3 Spheroidal or nodular graphite iron castings
3.1 Scope
3.2 Heat treatment
3.3 Test material
3.4 Mechanical tests
3.5 Metallographic examination

Section 4 Iron castings for crankshafts
4.1 Scope
4.2 Manufacture
4.3 Heat treatment
4.4 Test material
4.5 Non-destructive examination
4.6 Rectification of defective castings
4.7 Certification of materials

CHAPTER 8 ALUMINIUM ALLOYS

Section 1 Plates, bars and sections
1.1 Scope
1.2 Manufacture
1.3 Quality of materials
1.4 Dimensional tolerances
1.5 Chemical composition
1.6 Heat treatment
1.7 Test material
1.8 Mechanical tests
1.9 Corrosion tests
1.10 Pressure weld tests
1.11 Visual and non-destructive examination
1.12 Rectification of defects
1.13 Identification
1.14 Certification of materials

Section 2 Aluminium alloy rivets
2.1 Scope
2.2 Chemical composition
2.3 Heat treatment
2.4 Test material
2.5 Mechanical tests
2.6 Tests from manufactured rivets
2.7 Identification
2.8 Certification of materials

Section 3 Aluminium alloy castings
3.1 Scope
3.2 Manufacture
3.3 Quality of castings
3.4 Chemical composition
3.5 Heat treatment
3.6 Mechanical tests
3.7 Visual examination
3.8 Rectification of defective castings
3.9 Pressure testing
3.10 Identification
3.11 Certification of materials

Section 4 Aluminium/steel transition joints
4.1 Scope
4.2 Manufacture
4.3 Visual and non-destructive examination
4.4 Mechanical tests
4.5 Identification
4.6 Certification of materials

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

CHAPTER 9 COPPER ALLOYS

Section 1 Castings for propellers
1.1 Scope
1.2 Manufacture
1.3 Quality of castings
1.4 Chemical composition
1.5 Heat treatment
1.6 Test material
1.7 Mechanical tests
1.8 Inspection and non-destructive examination
1.9 Rectification of defective castings
1.10 Weld repair procedure
1.11 Identification
1.12 Certification of materials

Section 2 Castings for valves, liners and bushes
2.1 Scope
2.2 Manufacture
2.3 Quality of castings
2.4 Chemical composition
2.5 Heat treatment
2.6 Test material
2.7 Mechanical tests
2.8 Inspection
2.9 Rectification of defective castings
2.10 Pressure testing
2.11 Identification
2.12 Certification of materials

Section 3 Tubes
3.1 Scope
3.2 Manufacture
3.3 Quality
3.4 Dimensional tolerances
3.5 Chemical composition
3.6 Heat treatment
3.7 Mechanical tests
3.8 Visual examination
3.9 Stress corrosion cracking test
3.10 Hydraulic test
3.11 Rectification of defects
3.12 Identification
3.13 Certification of materials

CHAPTER 10 EQUIPMENT FOR MOORING AND ANCHORING

Section 1 Anchors
1.1 Scope
1.2 Manufacture
1.3 Cast steel anchors
1.4 Forged steel anchors
1.5 Fabricated steel anchors
1.6 Rectification
1.7 Super high holding power (SHHP) anchors
1.8 Assembly
1.9 Proof test of anchors
1.10 Clearances and tolerances
1.11 Identification
1.12 Certification

Section 2 Stud link chain cables for ships

2.1 Scope
2.2 Manufacture
2.3 Flash butt welded chain cable
2.4 Cast chain cables
2.5 Forged chain cables
2.6 Stud material
2.7 Welding of studs
2.8 Heat treatment of completed chain cables
2.9 Testing of completed chain cables
2.10 Proof load tests
2.11 Breaking load tests
2.12 Dimensional inspection
2.13 Fittings for chain cables
2.14 Substitute single links
2.15 Dimensions and tolerances
2.16 Identification
2.17 Certification

Section 3 Stud link mooring chain cables

3.1 Scope
3.2 Manufacture
3.3 Dimensions and tolerances
3.4 Studs
3.5 Heat treatment of completed chain cables
3.6 Testing of completed chain cables
3.7 Connecting common links or substitute links
3.8 Fittings for offshore mooring chain
3.9 Identification
3.10 Documentation
3.11 Certification

Section 4 Studless mooring chain cables

4.1 Scope
4.2 Manufacture
4.3 Shape and dimensions of links
4.4 Dimensional tolerances
4.5 Heat treatment
4.6 Testing of completed chain
4.7 Connecting or substitute links
4.8 Fittings
4.9 Identification
4.10 Certification
4.11 Documentation

Section 5 Short link chain cables

5.1 Scope
5.2 Manufacture
5.3 Bar material
5.4 Testing and inspection of chain cables
5.5 Dimensions and tolerances
5.6 Identification
5.7 Certification

Section 6 Steel wire ropes

6.1 Scope
6.2 General requirements
6.3 Steel wire for ropes
6.4 Tests on completed ropes
6.5 Inspection
6.6 Identification
6.7 Certification

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Contents

Section 7 Fibre ropes
7.1 Manufacture
7.2 Tests of completed ropes
7.3 Identification
7.4 Certification

CHAPTER 11 APPROVAL OF WELDING CONSUMABLES

Section 1 General
1.1 Scope
1.2 Grading
1.3 Manufacture
1.4 Approval procedures
1.5 Annual inspection and tests
1.6 Changes in grading
1.7 Manufacturers' Quality Assurance Systems
1.8 Certification

Section 2 Mechanical testing procedures
2.1 Dimensions of test specimens
2.2 Testing procedures
2.3 Re-testing procedures

Section 3 Electrodes for manual and gravity welding
3.1 General
3.2 Deposited metal test assemblies
3.3 Butt weld test assemblies
3.4 Hydrogen test
3.5 Fillet weld test assemblies
3.6 Electrodes designed for deep penetration welding
3.7 Deep penetration butt weld test assemblies
3.8 Deep penetration fillet weld test assemblies
3.9 Electrodes designed for gravity or contact welding
3.10 Annual tests

Section 4 Wire-flux combinations for submerged-arc automatic welding
4.1 General
4.2 Approval tests for multi-run technique
4.3 Deposited metal test assemblies (multi-run technique)
4.4 Butt weld test assemblies (multi-run technique)
4.5 Approval tests for two-run technique
4.6 Butt weld test assemblies (two-run technique)
4.7 Annual tests

Section 5 Wires and wire-gas combinations for manual, semi-automatic and automatic welding
5.1 General
5.2 Approval tests for manual and semi-automatic multi-run welding
5.3 Approval tests for multi-run automatic welding
5.4 Approval tests for two-run automatic welding
5.5 Annual tests

Section 6 Consumables for use in electro-slag and electro-gas welding
6.1 General
6.2 Butt weld test assemblies
6.3 Annual tests

Section 7 Consumables for use in one-side welding with temporary backing materials
7.1 General
7.2 Approval tests for manual (m), semi-automatic (S) and automatic multi-run (M) techniques
7.3 Approval tests for high heat input automatic (A) techniques
7.4 Annual tests

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Section 8 Consumables for welding austenitic and duplex stainless steels
8.1 General
8.2 Deposited metal test assemblies
8.3 Butt weld test assemblies
8.4 Fillet weld test assemblies
8.5 Annual tests

Section 9 Consumables for welding aluminium alloys
9.1 General
9.2 Approval tests for manual, semi-automatic and automatic multi-run techniques
9.3 Deposited metal test assembly
9.4 Butt weld test assemblies
9.5 Fillet weld test assembly
9.6 Approval tests for two-run technique
9.7 Butt weld test assemblies (two-run technique)
9.8 Annual tests

CHAPTER 12 WELDING QUALIFICATIONS

Section 1 General qualification requirements
1.1 General
1.2 Design
1.3 Materials
1.4 Performance of welding tests

Section 2 Welding Procedure Qualification Tests for Steels
2.1 General
2.2 Welding variables
2.3 Steel test assemblies
2.4 Welding of steel test assemblies
2.5 Non-destructive examination (NDE)
2.6 Destructive tests – General requirements
2.7 Destructive tests for steel butt welds
2.8 Destructive tests for steel fillet welds
2.9 Destructive tests for T, K, Y steel nozzle welds
2.10 Destructive tests for steel pipe branch welds
2.11 Destructive tests for weld cladding of steel
2.12 Mechanical test acceptance criteria for steels
2.13 Failure to meet requirements (Retests)
2.14 Test records
2.15 Range of approval
2.16 Welding procedure specification (WPS)

Section 3 Specific requirements for stainless steels
3.1 Scope
3.2 Austenitic stainless steels
3.3 Duplex stainless steels
3.4 Martensitic stainless steels

Section 4 Welding procedure tests for non-ferrous alloys
4.1 Requirements for aluminium alloys
4.2 Requirements for copper alloys

Section 5 Welder qualification tests
5.1 Scope
5.2 Welder qualification test assemblies
5.3 Examination and testing
5.4 Acceptance criteria
5.5 Failure to meet requirements
5.6 Range of approval
5.7 Welders qualification certification

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

CHAPTER 13 REQUIREMENTS FOR WELDED CONSTRUCTION

Section 1 General welding requirements
1.1 Scope
1.2 Design
1.3 Materials
1.4 Requirements for manufacture and workmanship
1.5 Cutting of materials
1.6 Forming and bending
1.7 Assembly and preparation for welding
1.8 Welding equipment and welding consumables
1.9 Welding procedure and welder qualifications
1.10 Welding during construction
1.11 Non-destructive examination of welds
1.12 Routine weld tests
1.13 Rectification of material defects
1.14 Rectification of distortion
1.15 Rectification of welds defects
1.16 Post-weld heat treatment
1.17 Certification

Section 2 Specific requirements for ship hull structure and machinery
2.1 Scope
2.2 Welding consumables
2.3 Welding procedure and welder qualifications
2.4 Construction and workmanship
2.5 Butt welds
2.6 Lap connections
2.7 Closing plates
2.8 Stud welding
2.9 Fillet welds
2.10 Post-weld heat treatment
2.11 Tolerances
2.12 Non-destructive examination of welds
2.13 Weld repairs
2.14 Welding afloat with water backing

Section 3 Specific requirements for fabricated steel sections
3.1 Scope
3.2 Dimensions and tolerances
3.3 Identification of products
3.4 Manufacture and workmanship
3.5 Non-destructive examination
3.6 Routine weld tests
3.7 Certification and records

Section 4 Specific requirements for fusion welded pressure vessels
4.1 Scope
4.2 Cutting and forming of shells and heads
4.3 Fitting of shell plates and attachments
4.4 Welding
4.5 General requirements for routine weld production tests
4.6 Production test plate assembly requirements
4.7 Inspection and testing
4.8 Mechanical requirements
4.9 Failure to meet requirements
4.10 Heat treatment
4.11 Basic requirements for heat treatment of fusion welded pressure vessels
4.12 Non-Destructive Examination of welds
4.13 Extent of NDE for Class 1 pressure vessels
4.14 Extent of NDE for Class 2/1 pressure vessels
4.15 NDE method
4.16 Evaluation and reports
4.17 Repair to welds

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Contents

Section 5 Specific requirements for pressure pipework
5.1 Scope
5.2 Manufacture and workmanship
5.3 Heat treatment after bending of pipes
5.4 Post-weld heat treatment
5.5 Non-destructive examination
5.6 Repairs to pipe welds

Section 6 Repair of existing ships by welding
6.1 Scope
6.2 Materials used for repairs
6.3 Workmanship
6.4 Non-destructive examination
6.5 Repairs to welds defects

Section 7 Austenitic and duplex stainless steel – Specific requirements
7.1 Scope
7.2 Design
7.3 Forming and bending
7.4 Fabrication and welding
7.5 Repairs

Section 8 Specific requirements for welded aluminium
8.1 Scope
8.2 Forming and bending
8.3 Fabrication and welding
8.4 Non-destructive examination

CHAPTER 14 PLASTICS MATERIALS AND OTHER NON-METALLIC MATERIALS

Section 1 General requirements
1.1 Scope
1.2 Information on material quality and application
1.3 Manufacture
1.4 Survey procedure
1.5 Alternative survey procedure
1.6 Post-cure heating
1.7 Test material
1.8 Re-test procedure
1.9 Visual and non-destructive examination
1.10 Rectification of defective material
1.11 Identification of products and base materials
1.12 Certification

Section 2 Tests on polymers, resins, reinforcements and associated materials
2.1 Scope
2.2 Thermoplastic polymers
2.3 Thermosetting resins
2.4 Reinforcements
2.5 Reinforced thermoplastic polymers
2.6 Reinforced thermosetting resins
2.7 Core materials
2.8 Specific requirements for end-grain balsa
2.9 Specific requirements for rigid foams (PVC, Polyurethane and other types)
2.10 Synthetic felt type materials with or without microspheres
2.11 Machinery chocking compounds (resin chocks)
2.12 Rudder and pintle bearings
2.13 Sterntube bearings
2.14 Plywoods
2.15 Adhesive and sealant materials
2.16 Repair compounds

General Requirements

Section

1 **Scope**

2 **Approval and survey requirements**

3 **Certification of materials**

4 **General requirements for manufacture**

5 **Non-destructive examination**

6 **References**

■ *Section 1* Scope

1.1 General

1.1.1 Materials used for the construction, conversion, modification or repair of ships, other marine structures and associated machinery which are classed or are intended for classification by Lloyd's Register (hereinafter refered to as LR), are to be manufactured, tested and inspected in accordance with these Rules.

1.1.2 Wrought, cast and extruded materials are to comply with the requirements of Chapters 1 and 2, and the appropriate specific requirements of Chapters 3 to 9 of these Rules. Mooring and anchoring equipment is to comply with the requirements of Chapters 1 and 2, and the appropriate specific requirements of Chapter 10. Manufacturers of these materials must be approved by LR according to the requirements in Sections 2 or 3. Only those materials within a manufacturer's scope of approval may be used.

1.1.3 Welding consumables are to comply with the requirements of Chapter 11 of these Rules.

1.1.4 Where welding is used for the construction, conversion, modification or repair of ships, other marine structures and associated machinery which are classed or are intended for classification by LR, welding qualifications and tests shall be performed according to Chapter 12 of these Rules. All welding shall be performed according to Chapter 13 of these Rules.

1.1.5 Plastics materials are to comply with the requirements of Chapter 14 of these Rules.

1.1.6 The materials and components which are to comply with these requirements for the purposes of classification are defined in the relevant Rules dealing with design and construction.

■ *Section 2* Approval and survey requirements

2.1 Approval and survey requirements – General

2.1.1 Marine materials manufactured in accordance with Chapters 3 to 10 of these Rules are to be made at works which have been approved by LR for the type and grade of product being supplied.

2.1.2 Materials manufactured in accordance with Chapters 3 to 10 of these Rules are to be manufactured, tested and inspected under Survey according to the requirements of one of the following two schemes:
(a) The Materials Survey Scheme, *see* 2.3.
(b) The Materials Quality Scheme, *see* 2.4.

2.1.3 For the purposes of survey, LR Surveyors are to be allowed access to all relevant parts of the works, and are to be provided with the necessary facilities and information to enable them to verify that the manufacture is being carried out in accordance with the approved procedures. Facilities are also to be provided for the selection of test material, the witnessing of mechanical tests and the examination of materials, as required by these Rules.

2.1.4 Where a production process, testing or examination of materials is sub-contracted, this must be with the approval of LR. Surveyors are to be allowed access to the sub-contractor's premises in order to conduct Surveys according to the requirements of these Rules.

2.1.5 Products manufactured in accordance with Chapters 11 and 14 are to be approved in accordance with the requirements therein. For these materials, approval is given for a specific product on a type approval basis, rather than the approved manufacturer/survey arrangements applied to materials covered by Chapters 3 to 10.

2.2 LR Approval – General

2.2.1 Unless specifically stated in other Chapters of these Rules, all LR approvals apply to materials used in applications intended for marine service, as described in 1.1.

2.2.2 The procedures for application for approval of manufacturers and products, the details of the information to be supplied by the manufacturer, and the test programme to be conducted on the products are given in the appropriate book of LR's *Materials and Qualification Procedures for Ships* (MQPS). This is published in the CD Live section of LR's web site at http://www.lr.org.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2.2.3 LR publishes lists of approved manufacturers and approved products. The lists are published in the CD Live section of LR's website, http://www.lr.org.
The lists are as follows:

- *List of Approved Manufacturers of Materials*.
- *Approved Welding Consumables for Use in Ship Construction*.
- *Lists of Paints, Resins, Reinforcements and Associated Materials*.
- *Lists of Approved Anchors*.

2.2.4 For initial LR approval as an Approved Manufacturer for a particular material, the manufacturer is required to demonstrate to the satisfaction of LR that the necessary manufacturing and testing facilities are available, and are supervised by suitably qualified personnel. A specified programme of tests is to be carried out under the supervision of LR Surveyors, and the results are to be to the satisfaction of LR.

2.2.5 If the results of the initial assessment of the manufacturer, and the test programme are considered satisfactory, the manufacturer will be added to the list of approved manufacturers of materials, and a certificate of approval will be issued to the manufacturer by LR, showing the scope of materials and grades covered by the approval. Initial approval will generally be under the Materials Survey Scheme, *see* 2.3.

2.2.6 Approved manufacturers who meet the entry requirements may apply for approval under the Materials Quality Scheme, *see* 2.4.

2.2.7 When a manufacturer has more than one works, the manufacturer's approval shall only be valid for the works where the test programme was conducted.

2.2.8 It is the manufacturer's responsibility to advise LR of all changes to the manufacturing process parameters that may affect the application of the material, prior to the adoption of the changes in production. Additional approval tests may be required to maintain the approval.

2.2.9 Maintenance of approval is dependent on the manufacturer continuing to meet the requirements of the applicable sections of these Rules.

2.2.10 Where it is considered that an approved manufacturer is not maintaining its responsibilities to comply with these Rules, the approval may be suspended by LR until such time that agreed corrective and preventive actions are considered to have been satisfactorily carried out. If considered necessary, LR may require that the normal level of testing and inspection is increased.

2.2.11 In all instances, LR will reduce the scope of, or withdraw approval from, a manufacturer where it becomes apparent that the manufacturer is unable to maintain compliance with these Rules or the scope of approval.

2.2.12 Where a manufacturer disagrees with any decisions made with regard to LR approval, they may appeal in writing to LR.

2.2.13 Any documents, data or other information received as part of the approval process will be treated as strictly confidential, and will not be disclosed to any third party, without the manufacturer's prior written consent.

2.3 Materials Survey Scheme

2.3.1 Materials according to Chapters 3 to 10 of these Rules and produced under the Materials Survey Scheme will be subject to Direct Survey by an LR Surveyor. The scheme requires the Surveyor to survey and certify all materials according to the requirements of these Rules.

2.3.2 Approved manufacturers are to request a survey of the material by an LR Surveyor, when required. Manufacturers must provide the Surveyor with details of the order, specification and any special conditions additional to the requirements of these Rules.

2.3.3 All mechanical tests required by these Rules are to be witnessed. The Surveyor may allow part of this task to be carried out by a member of the works staff by prior written agreement.

2.3.4 Before final acceptance, all materials are to be submitted to the specified tests and examinations under conditions acceptable to the Surveyor. The results are to comply with the Rules, and all materials are to be to the satisfaction of the Surveyor.

2.3.5 The specified tests and examinations are to be carried out prior to the despatch of finished materials from the manufacturer's works. Where materials are supplied in the rough or unfinished condition, as many as possible of the specified tests are to be carried out by the manufacturer, and any tests or examinations that are not completed are to be carried out under survey at a subsequent stage of manufacture.

2.3.6 In the event of any material proving unsatisfactory during subsequent working, machining or fabrication, such material is to be rejected, notwithstanding any previous certification.

2.3.7 In addition to witnessing test results, the Surveyor is responsible for ensuring that the manufacturing process, inspection, testing, identification and certification are properly conducted. As part of the Materials Survey Scheme, regular visits will be made to all relevant parts of the works to check for compliance against the requirements of these Rules, and to ensure that the manufacturer is maintaining the capability to consistently produce approved materials.

2.3.8 The Surveyor, when satisfied that the material fully meets the requirements of these Rules, will certify the material in accordance with Section 3 and the appropriate Chapter of these Rules.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2.3.9 For a manufacturer to maintain approval under this scheme, the works will be subject to a periodic inspection of all relevant parts of the works, at intervals not exceeding three years. The procedure for this periodic inspection is given in Book B of LR's *Materials and Qualification Procedures for Ships* (MQPS). This periodic inspection is in addition to the regular visits made according to 2.3.7.

2.4 Materials Quality Scheme

2.4.1 The manufacturer may apply to be approved under the Materials Quality Scheme where the following requirements are met:

(a) The manufacturer has been approved by LR for a minimum of three years; and

(b) The manufacturer has a quality management system, which has been certified as meeting the requirements of ISO 9001 by a certification body recognised by LR, which is one accredited by a member of the International Accreditation Forum; and

(c) The manufacturer has a satisfactory history of quality performance in the manufacture and supply of LR approved materials.

2.4.2 Special consideration may be given to manufacturers who have not been approved under the Materials Survey Scheme, and may be considered onto the Materials Quality Scheme providing:

(a) They have a quality management system which has been certified as meeting the requirements of ISO 9001 by a certification body recognised by LR, which is one accredited by a member of the International Accreditation Forum.

(b) They can demonstrate a history of satisfactory supply of materials which LR deems to be equivalent to those for which approval under the Materials Quality Scheme is requested.

In this case, the initial assessment of the manufacturer will include the product testing regime, as required for initial approval under the Materials Survey Scheme, *see* 2.2.4.

2.4.3 The Scheme is based on a Scheme Certification Schedule, made between LR and each individual manufacturer. The schedule will stipulate:

(a) The scope of approved products covered by the approval.

(b) The process route applied by the manufacturer for each approved product.

(c) The arrangements for LR scheme, audits, including scope, frequency, schedule, etc.

(d) Agreed procedures for certification of approved materials.

(e) Information to be supplied periodically to LR by the manufacturer.

(f) Procedures for the use of the scheme mark.

2.4.4 The contents of the Scheme Certification Schedule are to remain confidential between LR and the manufacturer.

2.4.5 The Materials Quality Scheme is based on a technical audit approach, and is designed to complement the quality management systems audits performed to ISO 9001. The role of the Surveyor in scheme audits is to:

(a) Verify that the quality management system is being maintained and audited to the requirements of ISO 9001.

(b) Verify that the requirements of these Rules are being implemented.

(c) Verify that the requirements of this Scheme are being implemented.

(d) Perform Scheme audits, which focus on the technical aspects of the product realisation process, particularly with regard to Rule requirements.

(e) Perform witness testing as required.

(f) Verify the data supplied to LR periodically by the manufacturer as part of the Scheme requirements.

2.4.6 The Materials Quality Scheme may be applied to any approved manufacturer who meets the eligibility requirements, and who applies to be approved under the scheme. If approved under the scheme, the manufacturer's name will appear on the List of Approved Manufacturers published by LR, with an indication that they are approved under this scheme.

2.4.7 The scheme is available to manufacturers producing approved materials according to Chapters 3 to 10 of these Rules.

2.4.8 The procedures for application for approval for the Materials Quality Scheme are given in Book M of LR's *Materials and Qualification Procedures for Ships* (MQPS).

2.4.9 Where LR is satisfied that the manufacturer meets all of the requirements of the Scheme, and that it is appropriate for the products being manufactured, a Scheme Certification Schedule will be issued, which must be signed by an authorised representative of the manufacturer.

2.4.10 Once the Scheme Certification Schedule has been signed by both parties, LR will issue the manufacturer with a certificate of approval according to the Materials Quality Scheme.

2.4.11 Maintenance of approval will be according to the Scheme Certification Schedule agreed between LR and the manufacturer, and these Rules.

2.4.12 It is the responsibility of the attending Surveyor to perform regular Scheme audits at the manufacturer's works in accordance with the Scheme Certification Schedule, and the requirements of these Rules.

2.4.13 It is not the intention to repeat the audit according to ISO 9001 conducted by the recognised certification body. The Surveyor is, however, to be satisfied that these audits are being conducted effectively. Where appropriate, the Surveyor may conduct a partial audit to ISO 9001 to verify this.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2.4.14 Witness tests may be conducted as part of the Scheme audit. This will involve the selection of material, and the witness of sampling and testing according to the requirements of the appropriate chapter of these Rules. Such witness testing may be on LR grades, or materials which the Surveyor deems to be equivalent (for the purposes of audit testing only).

2.4.15 Once every three years, a full assessment of scheme compliance will be conducted by a Surveyor who is not the regular attending Surveyor.

2.4.16 In the event of any change which means that the manufacturer no longer meets the requirements for the Materials Quality Scheme (for example the loss of ISO 9001 approval), the Scheme certificate of approval will be revoked. The manufacturer will revert to the Materials Survey Scheme, and will be subject to survey according to that scheme.

■ *Section 3* Certification of materials

3.1 General

3.1.1 All materials subject to these Rules are to be supplied with appropriate certification, as required by the relevant requirements of these Rules. This will normally be an LR certificate or a manufacturer's certificate validated by LR, although a manufacturer's certificate may be accepted where allowed by the relevant requirements of these Rules.

3.1.2 Manufacturers approved under the Materials Quality Scheme are licensed to apply the scheme mark to manufacturer's certificates according to the requirements of the scheme, *see* 2.4.

3.1.3 The following certificate types are to be used, (a) and (b) for the Materials Survey Scheme, and (d) for the Materials Quality Scheme:

(a) **LR Certificate**
This type of certificate is issued by LR based on the results of testing and inspection being satisfactorily carried out in accordance with the requirements of these Rules.

(b) **Manufacturer's certificate validated by LR**
A manufacturer's certificate, validated by LR on the basis of inspection and testing carried out on the delivered product in accordance with the requirements of these Rules may be accepted. In this case, the certificate will include the following statement:
"We hereby certify that the material has been made by an approved process and satisfactorily tested in accordance with the Rules of Lloyd's Register."

(c) **Manufacturer's certificate**
This type of certificate is issued by the manufacturer based on the results of testing and inspection being satisfactorily carried out in accordance with the requirements of these Rules or the applicable National or International standard. The certificate is to be validated by the manufacturer's authorised representative, independent of the manufacturing department. The certificate will contain a declaration that the products are in compliance with the requirements of these Rules or the applicable National or International standard.

(d) **Manufacturer's certificate issued under the Materials Quality Scheme**
Where a manufacturer is approved according to the Materials Quality Scheme, they will issue manufacturer's certificates bearing the scheme mark. The certificates must also bear the following statement:
"This certificate is issued under the arrangements authorised by Lloyd's Register (operating group) in accordance with the requirements of the Materials Quality Scheme and certificate number MQS ....."

3.1.4 Where these Rules allow for the issue of a manufacturer's certificate for materials, either validated by an LR Surveyor, or bearing the Materials Quality Scheme mark, the manufacturer is to ensure that a copy of the certificate is supplied to LR.

3.2 Materials Survey Scheme

3.2.1 The requirements for certification of materials according to the Materials Survey Scheme are established by the relevant requirements of these Rules.

3.2.2 The manufacturer is to supply the surveyor with any additional customer order requirements that are in addition to the requirements of these Rules, when the request for the issue or validation of the certificate is made.

3.3 Materials Quality Scheme

3.3.1 Part of the certification schedule will include an agreement for the manufacturer to apply the scheme mark to manufacturer's certificates relating to approved products within the scope of approval of the manufacturer.

3.3.2 The use of the scheme mark is governed by the following:

(a) The use of the scheme mark is not transferable. It is only to be used in conjunction with the manufacturer and works name and location shown on the certificate of approval.

(b) The scheme mark must be applied to all manufacturers' certificates relating to approved materials produced under the Scheme.

(c) In no circumstances is the scheme mark to be applied to test certificates relating to non-approved products.

(d) The scheme mark is not to be used in any way which may imply approval for products which are not covered within the manufacturer's scope of approval.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

(e) Where a manufacturer is removed or suspended from the scheme, use of the scheme mark must cease immediately.

3.3.3 The certificate as given in 3.1.3(d) is to be validated by an authorised representative of the manufacturer. The size and position of the scheme mark and statement on the manufacturer's certificate must be agreed by LR.

3.3.4 Where manufacturers are approved under this scheme, the manufacturer's certificate issued according to these requirements fully meets the materials certification requirements of these Rules.

3.4 Electronic certification

3.4.1 Where these Rules allow the issue of manufacturers' test certificates, under either the Materials Survey Scheme or the Materials Quality Scheme, these may be issued in electronic format provided that:

(a) All tests and inspections have been satisfactorily completed according to the requirements of these Rules.
(b) Procedures are in place to ensure that electronic certificates are only issued according to the requirements of these Rules.
(c) The certification system is subject to regular inspection by the attending Surveyor.
(d) A copy of the electronic certificate is supplied to LR. This copy will be deemed to be the original of the test certificate.

3.4.2 In addition to the requirements of 3.4.1, for items certified under the Materials Survey Scheme, the LR office stamp and Surveyor's name may be applied electronically. This is only allowed where the Surveyor has access to the results of the relevant tests and inspections, and is able to authorise by access to the electronic system, the application of the LR office stamp and Surveyor's name on the test certificate. The name of the authorising Surveyor is to be the name included on the certificate. The authorisation may be conducted electronically either at the manufacturers' works, or remotely by the Surveyor.

3.4.3 If the LR office stamp and name are being applied electronically according to 3.4.2, then the manufacturer is to ensure that the Surveyor is provided with all relevant information regarding the customer order, when the request for authorisation is made.

Section 4
General requirements for manufacture

4.1 General

4.1.1 The following definitions are applicable to these Rules:

Item: A single forging, casting, plate, tube or other rolled product as delivered.
Piece: The rolled product from a single slab or billet or from a single ingot if this is rolled directly into plates, strip, sections or bars.
Batch: A number of similar items or pieces presented as a group for acceptance testing.

4.1.2 Where a manufacturer purchases semi-finished products (e.g. slabs) for the purpose of re-processing (e.g. rolling), the manufacturer is to ensure that the materials are from an LR approved manufacturer, and manufactured within the scope of approval of that manufacturer. The aim of chemical analysis, dimensions, surface and internal quality checks are to be agreed between the manufacturer and purchaser. The semi-finished materials must be supplied with appropriate certification, according to these Rules.

4.1.3 It is the responsibility of the manufacturer to ensure compliance with all relevant aspects of these Rules. All deviations are to be recorded as non-compliances, and brought to the attention of the Surveyor, along with corrective actions taken. Failure to do this is considered to render the material as not complying with these Rules.

4.1.4 The manufacturer is to maintain all test and inspection records required by these Rules for at least seven years. Records are to be made available to LR on request.

4.1.5 Where material is produced which does not meet all aspects of these Rules, the manufacturer may apply to LR for a concession to certify the material as approved. LR will consider each application on a case-by-case basis, although concession will only normally be granted in exceptional circumstances. If the concession is granted, a formal written numbered concession will be issued to the manufacturer. The concession number must be applied to the approval certificate, whether it is an LR certificate or a validated manufacturer's certificate.

4.2 Chemical composition

4.2.1 The ladle analysis used for certification purposes is to be determined after all alloying elements have been added and sufficient time allowed for such additions to equalise throughout the ladle.

4.2.2 The method of taking samples is to ensure that the reported analysis is representative of the cast. In addition, the manufacturer must determine and certify the chemical composition of every heat of material.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.2.3 Where more than one sample is taken, the method of averaging for the final certificate result and the determination of acceptable variations in composition are to be agreed with the Surveyor.

4.2.4 The chemical composition of ladle samples is to be determined by the manufacturer in an adequately equipped and competently staffed laboratory. The manufacturer's analysis will be accepted, but may be subject to occasional independent checks if required by the Surveyor.

4.2.5 The analysis is to include the content of all the elements detailed in the relevant Sections of the Rules and, where appropriate, the National or International Standard applied.

4.2.6 At the discretion of the Surveyors, a check chemical analysis of suitable samples from products may also be required. These samples are to be taken from the material used for mechanical tests but, where this is not practicable, an alternative procedure for obtaining a representative sample is to be agreed with the manufacturer. For product samples, the permissible limits of deviation from the specified ladle analysis are to be in accordance with an appropriate International or National Standard specification.

4.3 Heat treatment

4.3.1 Materials are to be supplied in the condition specified in, or permitted by, the relevant Chapters of these Rules.

4.3.2 Heat treatment is to be carried out in properly constructed furnaces which are efficiently maintained and have adequate means for control and recording of temperature. The furnace dimensions are to be such as to allow the whole item to be uniformly heated to the necessary temperature. In the case of very large components which require heat treatment, alternative methods will be specially considered.

4.3.3 The manufacturer is to maintain the records, including the temperature charts of all heat treatments for at least seven years.

4.4 Test material

4.4.1 Sufficient test material is to be provided for the preparation of the test specimen detailed in the specific requirements. It is, however, in the interests of manufacturers to provide additional material for any re-tests which may be necessary, as insufficient or unacceptable test material may be a cause for rejection.

4.4.2 The test material is to be representative of the item or batch and is not to be separated until all the specified heat treatment has been completed, except where provision for an alternative procedure is made in subsequent Chapters of these Rules.

4.4.3 All test material is to be selected by the Surveyor or an authorised deputy and identified by suitable markings which are to be maintained during the preparation of the test specimens.

4.5 Mechanical tests

4.5.1 The dimensions, number and direction of test specimens are to be in accordance with the requirements of Chapter 2 and the specific requirements for the product.

4.5.2 Where Charpy impact tests are required, a set of three test specimens is to be prepared and the average energy value is to comply with the requirements of subsequent Chapters. One individual value may be less than the required average value provided that it is not less than 70 per cent of that value.

4.5.3 In the Rules, mechanical properties are specified in SI units, but alternative units may be used for acceptance testing. In such cases, the specified values are to be converted in accordance with the appropriate conversions given in Table 1.4.1. It is preferred that test results be reported in SI units, but alternative units may be used provided that the test certificate gives, in the same units, the equivalent specification values.

Table 1.4.1 Conversions from SI units to metric and Imperial units

1 N/mm^2 or MPa	=	0,102 kgf/mm^2
1 N/mm^2 or MPa	=	0,0647 $tonf/in^2$
1 N/mm^2 or MPa	=	0,145 x 10^3 lbf/in^2
1J	=	0,102 kgf m
1J	=	0,738 ft lbs
1 kgf/mm^2	=	9,81 N/mm^2 or MPa
1 $tonf/in^2$	=	15,4 N/mm^2 or MPa
1 lbf/in^2	=	6,89 x 10^{-3} N/mm^2 or MPa
1 kgf m	=	9,81 J
1 ft lbf	=	1,36 J

4.6 Re-test procedures

4.6.1 Re-test procedures are to be in accordance with the requirements of Ch 2,1.4.

4.7 Rectification of defective material

4.7.1 Small surface imperfections may be removed by mechanical means provided that, after such treatment, the dimensions are acceptable, the area is proved free from defects and the rectification has been completed in accordance with any applicable requirements of subsequent Chapters of these Rules and to the satisfaction of the Surveyor.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.7.2 The repair of defects by welding can be accepted only when permitted by the appropriate specific requirements and provided that the agreement of the Surveyor is obtained before the work is commenced. When a repair has been agreed, it is necessary in all cases to prove by suitable methods of non-destructive examination that the defects have been completely removed before welding is commenced. Welding procedures and inspection on completion of the repair are to be in accordance with the appropriate specific requirements and are to be to the satisfaction of the Surveyor.

4.7.3 Manufacturers wishing to carry out welding work must have at their disposal the necessary workshops, lifting gear, welding equipment, pre-heating, and where necessary annealing facilities and testing devices, as well as certified welders and supervisors to enable them to perform the work properly. Proof shall be furnished to the Surveyor that these conditions are satisfied before welding work begins.

4.8 Identification of materials

4.8.1 The manufacturer is to adopt a system of identification which will enable all finished materials to be traced to the original cast, and the Surveyors are to be given full facilities for tracing the material when required. When any item has been identified by the personal mark of a Surveyor, or his deputy, this is not to be removed until an acceptable new identification mark has been made by a Surveyor. Failure to comply with this condition will render the item liable to rejection.

4.8.2 Before any item is finally accepted it is to be clearly marked by the manufacturer in at least one place with the particulars detailed in the appropriate specific requirements.

4.8.3 Where hard stamps such as the LR brand stamp are issued to manufacturers to carry out the stamping on behalf of LR, the procedure for issue, maintenance and use of stamps is to be agreed in writing.

4.8.4 Hard stamping is to be used except where this may be detrimental to the material, in which case stencilling, painting or electric etching is to be used. Paints used to identify alloy steels are to be free from lead, copper, zinc or tin, i.e. the dried film is not to contain any of these elements in quantities of more than 250 ppm.

4.8.5 Where a number of identical items are securely fastened together in bundles, the manufacturer need only brand the top item of each bundle. Alternatively, a durable label giving the required particulars may be attached to each bundle.

■ *Section 5* Non-destructive examination

5.1 General NDE requirements

5.1.1 Prior to the final acceptance of materials, surface inspection and verification of dimensions, non-destructive examination is to be carried out in accordance with the requirements detailed in this Section and subsequent Chapters of these Rules.

5.1.2 It is the manufacturer's responsibility for maintaining the required tolerances and making the necessary measurements. Periodic surveys by the Surveyor do not absolve the manufacturer from this responsibility.

5.1.3 When there is visible evidence to doubt the soundness of any material or component, such as flaws in test specimens or suspicious surface marks, the manufacturer is expected to prove the quality of the material by a suitable method.

5.1.4 Acceptance criteria are detailed in subsequent Chapters of these Rules. Alternative specifications may be submitted for consideration, provided they demonstrate equivalence to these Rules.

5.2 Personnel qualifications

5.2.1 The shipyard, fabricator or manufacturer is to ensure that personnel carrying out non-destructive examination or interpreting the results of non-destructive examination are qualified to the appropriate level of a nationally recognised scheme such as ISO 9712, EN 473, PCN, ACCP or SNT-TC-1A. Level 1 personnel are not permitted to interpret results to Codes or Standards.

5.2.2 When certification of personnel is made on an in-house basis under a scheme such as SNT-TC-1A, practical examinations are to be relevant to material, product type, joint configuration, material thickness and acceptance criteria of items inspected for Classification purposes.

5.2.3 Personnel qualifications of NDE operators are to be randomly checked by the Surveyor.

5.3 Non-destructive examination methods

5.3.1 Non-destructive examination methods are to comply with the relevant requirements of these Rules.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

5.4 Non-destructive examination procedures

5.4.1 All non-destructive examinations are to be carried out to a procedure that is representative of the item under inspection. As a minimum the procedures are to be in accordance with the following:

(a) Procedures are to identify the component to be examined, the NDE method, equipment to be used and the full extent of the examinations including any test restrictions.
(b) Procedures are to specify the qualification and certification requirements of the inspection personnel to be employed.
(c) Procedures are to state the degree of surface preparation required and the methods of preparation to be used before the examinations are made.
(d) Procedures are to state the reference standards for testing and the acceptance criteria to be applied to the results of the inspections.
(e) Procedures are to include the requirement for components to be positively identified and for a datum system or marking system to be applied to ensure repeatability of inspections.
(f) Procedures are to identify any requirements for increasing the extent of applied NDE where defects have been found during spot examination.
(g) Procedures are to identify reporting requirements.
(h) Procedures are to be reviewed by the Surveyor to ensure they are appropriate for the product type.
(j) Procedures for radiography are to specify the acceptable optical density within the area of interest on the radiograph.
(k) The minimum optical density within the area of interest on a radiograph is to be equal to or greater than 2,0 for gamma ray and 1,8 for X-ray. A maximum density of 4,0 is acceptable.
(l) Procedures are to include the method and requirements for equipment calibrations and functional checks.
(m) Procedures are to be approved by an operator qualified to a minimum of Level III in accordance with a recognised standard.
(n) The Surveyor will review procedures for compliance with this Section.

5.4.2 The shipyard, fabricator or manufacturer may submit other Codes or Standards for consideration by LR, providing they meet the requirements of these Rules.

5.5 Non-destructive examination reports

5.5.1 NDE reports are to include all information required to identify how the examination was executed and are to include the following information where appropriate:

(a) Date of test.
(b) Name and qualification of operator with signatures of the operator.
(c) Details of the component identification, description of test location and volume examined.
(d) Heat treatment status.
(e) Weld type, procedure and configuration.
(f) Surface condition.
(g) Test procedure.
(h) Equipment used.
(j) Test results with a map or record of any defects, giving location, dimensions and defect nature.
(k) Reference to acceptance criteria and evaluation in accordance to these criteria.
(l) Material type and thickness.
(m) Calibration.

Section 1
General requirements for testing

1.1 Preparation of test specimens

1.1.1 The requirements specified below detail all the tests that may be applied to metallic materials. The specific tests and the test specimen types required for each material type, grade and product type are detailed in the subsequent Chapter of these Rules.

1.1.2 Where test material is cut from products by shearing or flame cutting, a reasonable margin is required to allow sufficient material to be removed from the cut edges during machining of the test specimens.

1.1.3 Test specimens are to be prepared in such a manner that they are not subjected to any significant work hardening, cold straining or heating during straightening or machining.

1.1.4 Test samples are not to be removed from the material they represent until heat treatment is complete. For castings in cases where test samples are separately cast, the castings and samples are to be heat treated together.

1.1.5 Dimensional tolerances are to comply with a relevant ISO specification.

1.2 Testing machines

1.2.1 All tests are to be carried out by competent personnel. Testing machines are to be maintained in a satisfactory and accurate condition and are to be recalibrated at approximately annual intervals. This calibration is to be carried out by organisations of standing that have been approved or recognised by a National Authority and are to be to the satisfaction of the Surveyor. A record of all calibrations is to be kept available in the test house.

1.2.2 Tensile testing machine load cells are to be calibrated with an accuracy of ± one per cent in accordance with ISO 7500-1 or another recognised National Standard.

1.2.3 Impact tests are to be carried out on Charpy V-notch machines calibrated to ISO 148, EN 10045 or ASTM E23 dependent on the testing machine type. The testing machines are to be calibrated using either a direct or indirect method. Other National Standards equivalent to ISO 148 may be considered.

1.3 Discarding of test specimens

1.3.1 If a test specimen fails because of faulty preparation or incorrect operation of the testing machine it may be discarded and replaced by a new test specimen prepared from material adjacent to the original test.

1.3.2 In addition to the discarding of test specimens as indicated in 1.3.1, a tensile test specimen may also be discarded when the specified minimum elongation is not obtained and the distance between the fracture and the nearest gauge mark is less than one-quarter of the gauge length.

1.4 Re-testing procedures

1.4.1 Where the result of any test, other than an impact test, does not comply with the requirements, two additional tests of the same type are to be made from the same test sample, or if sufficient material is not available, a further representative sample taken from the item under test. For acceptance of the material, satisfactory results are to be obtained from both of these additional tests.

1.4.2 Where the result of any test taken from a weld procedure approval test, other than an impact test, does not comply with the requirements, two additional tests of the same type are to be made from the same weld test assembly. Where insufficient original welded assembly is available, a new assembly is to be prepared using the same conditions as the original test weld. For acceptance, satisfactory results are to be obtained from both of these additional tests.

1.4.3 Where the result of any test taken from a welding consumable approval test, other than an impact test, does not comply with the requirements, two additional tests of the same type are to be made from the same weld test assembly. Where insufficient original welded assembly is available, a new assembly is to be prepared using welding consumables from the same batch. If the new assembly is made with the same procedure (particularly the same number of runs) as the original assembly, only the duplicate re-test specimens need be prepared and tested. For acceptance of a weld consumable batch, satisfactory results are to be obtained from both of these additional tests.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.4.4 Where the results from a set of three impact test specimens do not comply with the requirements, an additional set of three impact test specimens may be tested provided that, of the original set tested, not more than two individual values are less than the required average value and, of these, not more than one is less than 70 per cent of this average value. The results obtained are to be combined with the original results to form a new average which, for acceptance, is to be not less than the required average value. Additionally, for these combined results, not more than two individual values are to be less than the required average value and, of these, not more than one is to be less than 70 per cent of this average value.

1.4.5 The additional tests detailed in 1.4.1 and 1.4.2 are, where possible, to be made on material adjacent to the original samples. For castings, where insufficient material remains in the original test samples, the additional test may be made on other test samples representative of the castings. *See also* 1.3 for discarding of test specimens.

1.4.6 When unsatisfactory results are obtained from tests representative of a batch of material, the item or piece from which the tests were taken is to be rejected. The remainder of the material in the batch may be accepted provided that two further items or pieces are selected and tested with satisfactory results. If the tests from one or both or these additional items or pieces give unsatisfactory results, the batch is to be rejected.

1.4.7 When a batch of material is rejected, the remaining items or pieces in the batch may be resubmitted individually for test, and those which give satisfactory results may be accepted.

1.4.8 At the option of the manufacturer, rejected material may be resubmitted as another grade and may then be accepted, provided that the test results comply with the appropriate requirements.

1.4.9 When material which is intended to be supplied in the 'as-rolled' or 'hot-finished' condition fails test, it may be suitably heat treated and resubmitted for test. Similarly, materials supplied in the heat treated condition may be reheat treated and resubmitted for test. Unless otherwise agreed by the Surveyor, such reheat treatment is to be limited to one repeat of the final heat treatment cycle.

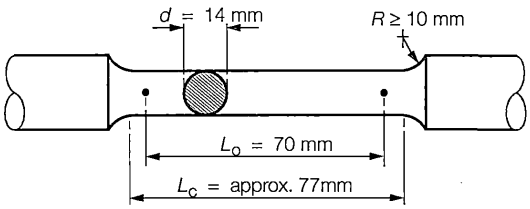
■ *Section 2*
Tensile tests

2.1 Dimensions of test specimens

2.1.1 Proportional test specimens with a gauge length L_o of $5{,}65\sqrt{S_o}$ or $5d$, where S_o is the cross-sectional area, d the diameter and L_c the parallel test length, have been adopted as the standard form of test specimen, and in subsequent Chapters in these Rules the minimum percentage elongation values are given for test specimens of these proportions.

2.1.2 The gauge length is to be greater than 20 mm and may be rounded off to the nearest 5 mm provided that the difference between the adjusted gauge length and the calculated one is less than 10 per cent of the calculated gauge length.

2.1.3 For forgings and castings (excluding those in grey cast iron) proportional test specimens of circular cross-section are to be machined to the dimensions shown in Fig. 2.2.1.

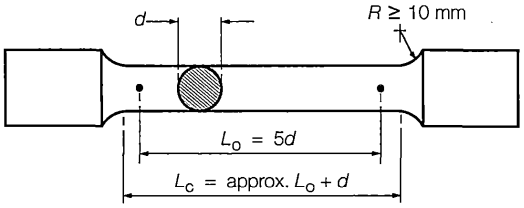


NOTE: For nodular cast iron and materials with a specified elongation less than 10%, $R \geq 20$ mm

Fig. 2.2.1
Test specimen dimensions for forgings and castings – I

2.1.4 For hot rolled bars and similar products, the test specimens are to be as in Fig. 2.2.1, except that for small sizes they may consist of a suitable length of bar or other product tested in the full cross-section.

2.1.5 As an alternative to 2.1.3 and 2.1.4, proportional or non-proportional test specimens of other dimensions may be used, subject to any requirements for minimum cross-sectional area given in subsequent Chapters of these Rules. Where the size of proportional test specimens is other than as shown in Fig. 2.2.1, the general dimensions are to conform with Fig. 2.2.2.

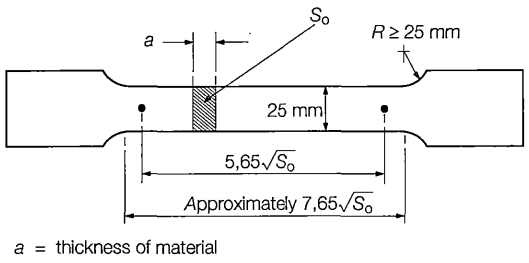


NOTE: For nodular cast iron and materials with a specified elongation less than 10%, $R \geq 1{,}5d$

Fig. 2.2.2
Test specimen dimensions for forgings and castings – II and aluminium alloys

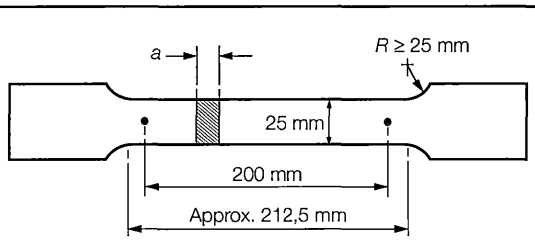
Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2.1.6 For plates, strip and sections, the test specimens are to be machined to the dimensions shown in Fig. 2.2.3 or Fig. 2.2.4. Where the capacity of the available testing machine is insufficient to allow the use of a test specimen of full thickness, this may be reduced by machining one of the rolled surfaces. Alternatively, for materials over 40 mm thick, test specimens of circular cross-section machined to the dimensions shown in Fig. 2.2.1 may be used. The axes of these test specimens are to be located at approximately one quarter of the thickness from one of the rolled surfaces.



a = thickness of material

Fig. 2.2.3
Test specimen dimensions for plates, strip and sections – I and aluminium alloys



a = thickness of material

Fig. 2.2.4
Test specimen dimensions for plates, strip and sections – II

2.1.7 As an alternative to 2.1.6, test specimens with a width of other than 25 mm may be used subject to any requirements for minimum cross-sectional area given in subsequent Chapters of these Rules. A ratio of width/thickness of 8:1 should not be exceeded.

2.1.8 For pipes and tubes, the test specimens may consist of a suitable length tested in full cross-section with the ends plugged. The gauge length is to be 5,65 $\sqrt{S_o}$ or 50 mm, and the length of the test specimen between the grips or plugs, whichever is the smaller, is to be not less than the gauge length plus D, where D is the external diameter. Alternatively, test specimens may be prepared from strips cut longitudinally and machined to the dimensions shown in Fig. 2.2.5 or Fig. 2.2.6. The parallel test length is not to be flattened, but the enlarged ends may be flattened for gripping in the testing machine. The cross-sectional area of this type of test specimen is to be calculated from:

$S_o = ab$

where

S_o = cross-sectional area
a = average radial thickness
b = average width

Test specimens of circular cross-section may also be used provided that the wall thickness is sufficient to allow the machining of such specimens to the dimensions shown in Fig. 2.2.1, with their axes located at the mid-wall thickness.

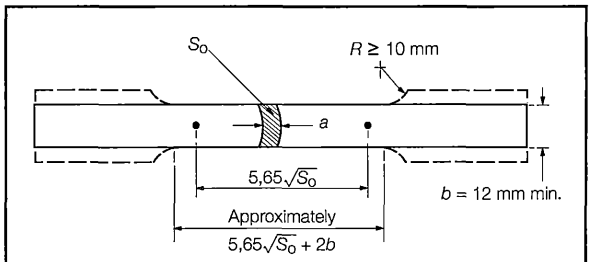


Fig. 2.2.5
Test specimen dimensions for pipes and tubes – I

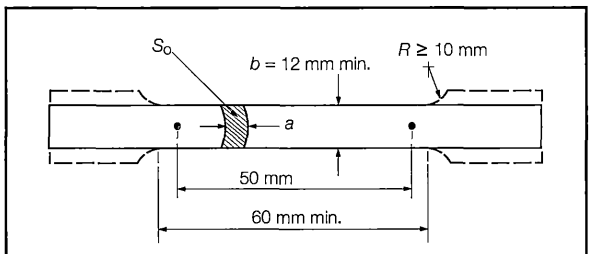

Fig. 2.2.6
Test specimen dimensions for pipes and tubes – II

2.1.9 For wire, the test specimen may consist of a suitable length tested in full cross-section. The gauge length is to be 200 mm and the parallel test length 250 mm.

2.1.10 For grey iron castings, the test specimens are to be machined to the dimensions shown in Fig. 2.2.7 or Fig. 2.2.8.

2.1.11 For aluminium alloy plates and sections of thickness, a, less than or equal to 12,5 mm; the dimensions of rectangular cross-sectioned test specimens are to be as shown in Fig. 2.2.3. The rectangular cross-sectioned test specimen surfaces should remain as rolled/extruded. Where the thickness, a, is greater than 12,5 mm the test specimens are to be of round type as shown in Fig. 2.2.2.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

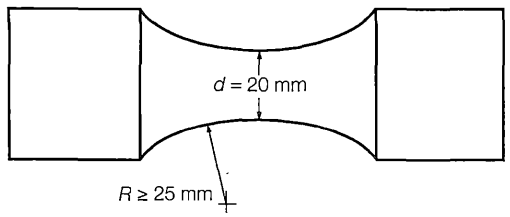

Fig. 2.2.7
Test specimen dimensions for grey iron castings – I

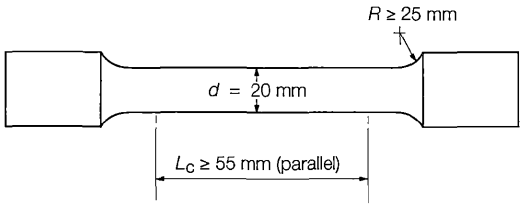

Fig. 2.2.8
Test specimen dimensions for grey iron castings – II

2.1.12 Deposited weld metal tensile test specimens are to be machined to the dimensions shown in Fig. 2.2.9, and may be heated to a temperature not exceeding 250°C for a period not exceeding 16 hours for hydrogen removal, prior to testing.

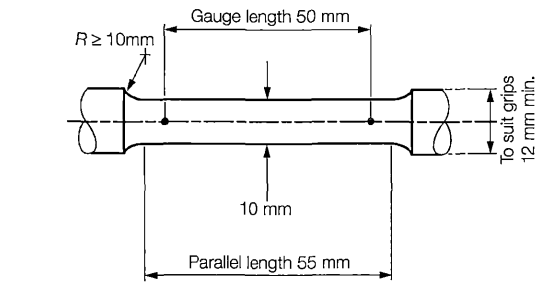

Fig. 2.2.9
Test specimen for deposited weld metal tensile

2.1.13 Butt weld tensile test specimens are to be machined to the dimensions shown in Fig. 2.2.10. For thicknesses of more than 2 mm, the test width is to be 25 mm. For thicknesses less than 2 mm, the test width is to be reduced to 12 mm. The upper and lower surfaces of the weld are to be filed, ground or machined flush with the surface of the plate.

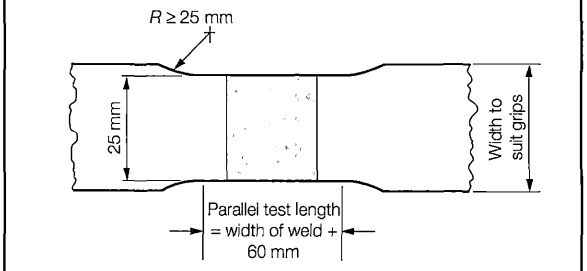

Fig. 2.2.10 Test specimen for butt weld

2.1.14 Through-thickness tensile test specimens may be, at the option of the steelmaker, either plain test specimens or test specimens with welded extensions in accordance with a Recognised Standard. The extension pieces are to be of steel with a tensile strength exceeding that of the plate to be tested and may be attached to the plate surfaces by manual, resistance or friction welding carried out in such a way as to ensure a minimal heat affected zone.

2.1.15 Tolerances on tensile specimen dimensions are to be in accordance with ISO 6892-1 or another Recognised Standard as appropriate.

2.2 Definition of yield stress for steel

2.2.1 The yield phenomenon is not exhibited by all the steels detailed in these Rules but, except for austenitic and duplex stainless steels, the term 'yield stress' is used throughout when requirements are specified for acceptance testing at ambient temperature. For the purposes of the Rules, the terms 'yield stress' and 'yield strength' are to be regarded as synonymous.

2.2.2 Where reference is made to 'yield stress' in the requirements for carbon, carbon-manganese and alloy steel products and in the requirements for the approval of welding consumables, either the upper yield stress or, where this is not clearly exhibited, the 0,2 per cent proof stress or the 0,5 per cent proof stress under load is to be determined. In cases of dispute, the 0,2 per cent proof stress is to be determined.

2.2.3 For austenitic and duplex stainless steel products and welding consumables, both the 0,2 and the 1,0 per cent proof stresses are to be determined.

2.3 Procedure for testing at ambient temperature

2.3.1 Except as provided in 2.3.5, the elastic stress rate for the determination of the upper yield for steels and copper alloys is to be between 6 and 60 N/mm^2 per second and between 2 and 20 N/mm^2 per second for aluminium. After reaching the yield or proof load, the straining rate may be increased to a maximum of $0{,}008s^{-1}$ for the determination of the tensile strength.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2.3.2 For steel, the upper yield stress is to be calculated from:

(a) the value of stress measured at the commencement of plastic deformation, or

(b) on a load/extension diagram using the value of stress measured at the first peak obtained during yielding even when the peak is equal to or less than any subsequent peaks observed during plastic deformation at yield.

2.3.3 When a well defined yield point cannot be obtained, the 0,2 or 1,0 per cent proof stress (non-proportional elongation) is to be determined from an accurate load/extension diagram by drawing a line parallel to the straight elastic portion and a distance from it where the amount represents 0,2 or 1,0 per cent of the extensometer gauge length. The point of intersection of this line with the plastic portion of the diagram represents the proof load, from which the 0,2 or 1,0 per cent proof stress can be calculated.

2.3.4 For stainless steels the 1,0 per cent proof stress and/or 0,2 per cent proof stress is specified as required by the relevant Chapters in these Rules.

2.3.5 For the determination of the tensile strength of flake graphite cast iron, the stress rate is not to exceed 10 N/mm^2 per second.

2.3.6 A measured elongation value is to be regarded as valid only if the fracture occurs within the gauge length and at least the following distances from the gauge marks:

Round test specimen: 1,25*d*

Flat test specimen: *a* plus width of specimen

The measurement is valid irrespective of the position of the fracture, if the percentage elongation after fracture reaches at least the specified value, and this is to be stated in the test report.

2.4 Equivalent elongations

2.4.1 When a gauge length other than $5,65\sqrt{S_o}$ is used, the equivalent percentage elongation value is to be calculated using the following formula:

$$A = \frac{A_R}{2}\left(\frac{L_o}{\sqrt{S_o}}\right)^{0,40}$$

where

A_R = actual measured percentage elongation of test specimen

S_o = actual cross-sectional area of test specimen

L_o = actual gauge length of test piece

A = equivalent percentage elongation for a test specimen with a gauge length of $5,65\sqrt{S_o}$

2.4.2 Alternatively, where a number of test specimens of similar material and dimensions are involved, the actual percentage elongation values may be recorded, provided that the equivalent specified minimum elongation value appropriate for the test specimen dimensions is calculated from the formula in 2.4.1 and is recorded on the test certificate.

2.4.3 For proportional test specimens having a gauge length other than $5,65\sqrt{S_o}$, the equivalent elongation may be calculated using the following factors (*d* is the diameter of the test specimen):

Actual gauge length	Factor for equivalent elongation on $5,65\sqrt{S_o}$
$4\sqrt{S_o}$	x 0,870
$8,16\sqrt{S_o}$	x 1,158
$11,3\sqrt{S_o}$	x 1,317
4*d*	x 0,916
8*d*	x 1,207

2.4.4 For non-proportional test specimens with gauge lengths of 50 mm and 200 mm, the equivalent elongation values tabulated in ISO 2566 are to apply.

2.4.5 The above conversions are reliable only for carbon, carbon-manganese and low alloy steels with a tensile strength not exceeding 700 N/mm^2 in the hot rolled, annealed, normalised, or normalised and tempered condition.

2.4.6 For alloy steels in the quenched and tempered condition, the following conversions may be used for proportional test specimens with a gauge length of $4\sqrt{S_o}$:

Actual percentage elongation on $4\sqrt{S_o}$	Equivalent elongation on $5,65\sqrt{S_o}$
22	17
20	15
18	13
17	12
16	12
15	11
14	10
12	8
10	7
8	5

2.4.7 Any proposals to use conversion factors for equivalent elongation values for the following materials are to be agreed with the Surveyors:

(a) Carbon, carbon-manganese and alloy steels in the normalised or normalised and tempered condition with a tensile strength exceeding 700 N/mm^2.

(b) Cold-worked steels.

(c) Austenitic stainless steels.

(d) Non-ferrous alloys.

2.5 Procedure for testing at elevated temperatures

2.5.1 The test specimens used for the determination of lower yield or 0,2 per cent proof stress at elevated temperatures are to have an extensometer gauge length of not less than 50 mm and a cross-sectional area of not less than 65 mm^2. Where, however, this is precluded by the dimensions of the product or by the test equipment available, the test specimen is to be of the largest practicable dimensions.

2.5.2 The heating apparatus is to be such that the temperature of the specimen during testing does not deviate from that specified by more than ±5°C.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2.5.3 The straining rate when approaching the lower yield or proof load is to be controlled within the range 0,1 to 0,3 per cent of the extensometer gauge length per minute.

2.5.4 The time intervals used for estimation of strain rate from measurements of strain are not to exceed 6 seconds.

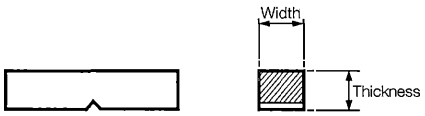
■ *Section 3* Impact tests

3.1 Dimensions of test specimens

3.1.1 Impact tests are to be of the Charpy V-notch type. The test specimens are to be machined to the dimensions and tolerances given in Table 2.3.1 and are to be carefully checked for dimensional accuracy.

Table 2.3.1 Dimensions and tolerances for Charpy V-notch impact test specimens

Dimension	Nominal	Tolerance
Length, mm	55	±0,60
Width, mm– standard specimen	10	±0,11
– standard subsidiary specimen	7,5	±0,11
– standard subsidiary specimen	5	±0,06
Thickness, mm	10	±0,06
Angle of notch	45°	±2°
Depth below notch, mm	8	±0,06
Root radius, mm	0,25	±0,025
Distance of notch from end of test specimen, mm	27,5	±0,42
Angle between plane of symmetry of notch and longitudinal axis of test specimen	90°	±2°



3.1.2 For material under 10 mm in thickness, the largest possible size of standard subsidiary Charpy V-notch test specimen is to be prepared with the notch cut on the narrow face. Generally, impact tests are not required when the thickness of the material is less than 6 mm.

3.2 Testing procedures

3.2.1 All impact tests are to be carried out on Charpy machines approved by Lloyd's Register (hereinafter referred as LR) and having a striking energy of not less than 150 J.

3.2.2 Charpy V-notch impact tests may be carried out at ambient or lower temperatures in accordance with the specific requirements given in subsequent Chapters of these Rules. Where the test temperature is other than ambient, the temperature of the test specimen is to be controlled to within ±2°C for sufficient time to ensure uniformity throughout the cross-section of the test specimen, and suitable precautions are to be taken to prevent any significant change in temperature during the actual test. In cases of dispute, ambient temperature is to be considered as 18°C to 25°C.

3.2.3 For acceptance, the average energy value for a set of three impact tests must be equal to or greater than the appropriate specified minimum average value. Additionally, only one individual value may be less than the required average value but not less than 70 per cent of this average value.

3.2.4 Where standard subsidiary Charpy V-notch test specimens are necessary, the minimum energy values required are to be reduced as follows:

Specimen 10 x 7,5 mm: 5/6 of tabulated energy.

Specimen 10 x 5 mm: 2/3 of tabulated energy.

3.2.5 When reporting results, the specimen dimensions and the units used for expressing the energy absorbed (Joules) and the testing temperature are to be clearly stated.

■ *Section 4* Ductility tests for pipes and tubes

4.1 Bend tests

4.1.1 The test specimens are to be cut as circumferential strips of full wall thickness and with a width of not less than 40 mm. For thick walled pipes, the thickness of the test specimens may be reduced to 20 mm by machining. The edges of the specimens may be rounded to a radius of 1,6 mm.

4.1.2 Testing is to be carried out at ambient temperature, and the specimens are to be doubled over a former whose diameter is to be in accordance with the specific requirements for the material. For submerged arc welded tube the test piece is to be bent with the root of the weld in tension. For other tubes, the test piece is to be bent in the original direction of curvature. In all cases, the welds are to be in the middle of the test specimen. The test is considered to be satisfactory if, after bending, the specimens are free from cracks and laminations. Small cracks at the edges of the test specimens are to be disregarded.

4.2 Flattening tests

4.2.1 Ring test specimens are to be cut with the ends perpendicular to the axis of the pipe or tube. The length of the specimen is to be equal to 1,5 times the external diameter of the pipe or tube, but is to be not less than 10 mm or greater than 100 mm. Alternatively, the length of the test specimen may be 40 mm irrespective of the external diameter.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.2.2 Testing is to be carried out at ambient temperature and is to consist of flattening the specimens in a direction perpendicular to the longitudinal axis of the pipe. Flattening is to be carried out between two plain parallel and rigid platens which extend over both the full length and the width after flattening of the test specimen. Flattening is to be continued until the distance between the platens, measured under load, is not greater than the value given by the formula:

$$H = \frac{t(1+C)}{C+\frac{t}{D}}$$

where

H = distance between plates, in mm
t = specified thickness of the pipe, in mm
D = specified outside diameter, in mm
C = a constant dependent on the steel type and detailed in the specific requirements

After flattening, the specimens are to be free from cracks or other flaws. Small cracks at the ends of the test specimens may be disregarded.

4.2.3 For welded pipes or tubes, the weld is to be placed at 90° to the direction of flattening.

4.3 Drift expanding tests

4.3.1 The test specimens are to be cut with the ends perpendicular to the axis of the tube. The edges of the end to be tested may be rounded by filing.

4.3.2 For metallic tubes, the length of the specimen is to be at least 1,5 times the external diameter of the tube except when a mandrel with an included angle of 30° is used, in which case the length of the specimen is to be twice the external diameter of the tube. In all cases the length of section remaining cylindrical after test is not be less than 0,5 times the external diameter.

4.3.3 Testing is to be carried out at ambient temperature and is to consist of expanding the end of the tube symmetrically by means of a hardened conical steel mandrel having a total included angle of 30°, 45° or 60°, *see* Fig. 2.4.1. The mandrel is to be forced into the test specimen at a rate not exceeding 50 mm/min until the percentage increase in the outside diameter of the end of the test specimen is not less than the value given in the specific requirements for boiler and superheater tubes, *see* Chapter 6. The mandrel is to be lubricated, but there is to be no rotation of the tube or mandrel during the test. The expanded portion of the tube is to be free from cracks or other flaws.

4.4 Flanging tests

4.4.1 The test specimens are to be cut with the ends perpendicular to the axis of the tube. The length of the specimens is to be at least equal to the external diameter of the tube and such that after testing the portion that remains cylindrical is not less than half the external diameter. The edges of the end to be tested may be rounded by filing.

4.4.2 Testing is to be carried out at ambient temperature and is to consist of flanging the end of the tube symmetrically by means of hardened conical steel mandrels. The rate of flanging is not to exceed 50 mm/min.

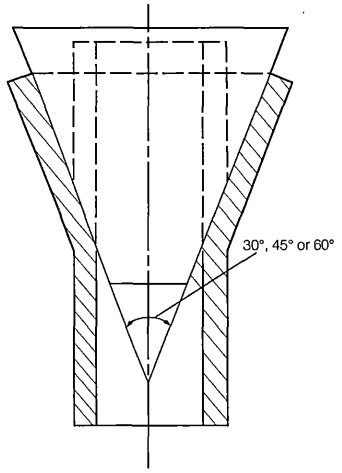


Fig. 2.4.1 Drift expanding test

4.4.3 The first stage of flanging is to be carried out with a conical angled mandrel having an included angle of approximately 90°, *see* Fig. 2.4.2(a). The completion of the test is achieved with a second forming tool as shown in Fig. 2.4.2(b). The mandrels are to be lubricated and there is to be no rotation of the tube or mandrels during the test. The test is to continue until the drifted portion has formed a flange perpendicular to the axis of the test specimens. The percentage increase in the external diameter of the end of the specimens is to be not less than the value given in the specific requirements for boiler and superheater tubes, *see* Chapter 6. The cylindrical and flanged portion of the tube is to be free from cracks or other flaws.

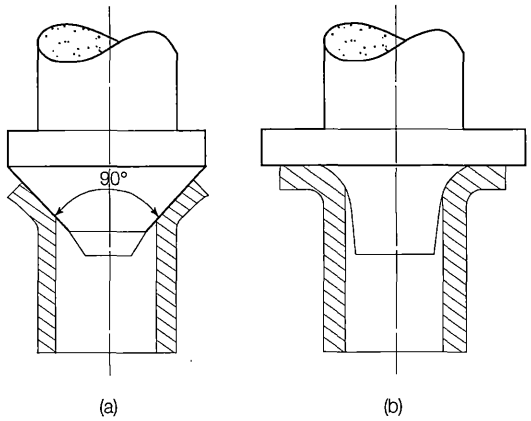

Fig. 2.4.2 Flanging test

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

■ *Section 5* Embrittlement tests

5.1 Temper embrittlement tests

5.1.1 The test material is to be heat treated in accordance with the specification except that after tempering:

(a) half the material is to be water quenched;

(b) the other half is to be cooled from the tempering temperature to 300°C at a rate not exceeding 10°C per minute.

5.1.2 Impact tests in accordance with Section 3 are to be made on the material in each condition at temperatures over a range wide enough to establish the upper and lower shelf energies and temperatures, tests being made at no less than three intermediate temperatures.

5.1.3 A set of three specimens is to be tested at each temperature. The results are to be plotted separately for each condition, in the form illustrated in Fig. 2.5.1. In addition, the test temperatures, proportions of crystallinity and absorbed energies for all the specimens tested are to be reported.

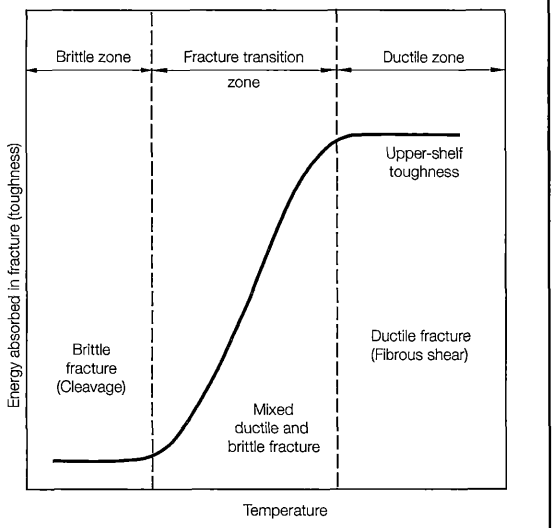

Fig. 2.5.1 Idealised transition curve

5.1.4 The transition temperature for each condition is to be taken as the mid-temperature of the fracture transition zone. The difference between the two transition temperatures is to be reported.

5.2 Strain age embrittlement tests

5.2.1 The test material is to be heat treated in accordance with the specification and then subjected to five per cent strain. Half of the test material is then to be heated to 250°C and held for one hour.

5.2.2 Impact tests in accordance with 5.1.2 are to be made in both the strained and unstrained conditions.

5.2.3 The tests are to comply with 5.1.3.

5.2.4 The test results are treated in accordance with 5.1.4.

5.3 Hydrogen embrittlement tests

5.3.1 Two specimens are to be tested. The specimens are to be of a diameter of 20 mm. Where this is not practicable a diameter of 14 mm may be accepted.

5.3.2 One specimen is to be tested within a maximum of 3 hours after machining. Where the specimen diameter is 14 mm, the time limit is 1,5 hours. Alternatively, the specimen may be cooled to –60°C immediately after machining and kept at that temperature for a maximum period of 5 days before being tested.

5.3.3 The other specimen is to be tested after baking at 250°C for 4 hours. Where the specimen diameter is 14 mm the baking time is to be 2 hours.

5.3.4 A strain rate not exceeding $0{,}0003s^{-1}$ is to be used during the entire test, until fracture occurs.

5.3.5 Tensile strength, elongation and reduction of area are to be reported.

5.3.6 The ratio Z_1/Z_2 is to be reported, where Z_1 is the reduction in area without baking and Z_2 the reduction in area after baking.

■ *Section 6* Crack tip opening displacement tests

6.1 Dimensions of test specimens

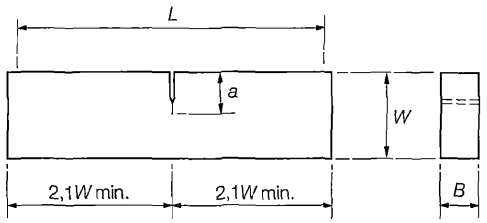
6.1.1 Unless agreed otherwise, tests are to be made on specimens of the full section thickness and which conform to a nationally agreed standard.

6.1.2 Normally the specimens are to be rectangular with the main dimensions as indicated in Fig. 2.6.1 and are to be tested in three point bending.

6.1.3 A subsidiary specimen as in Fig. 2.6.2 may be used by agreement.

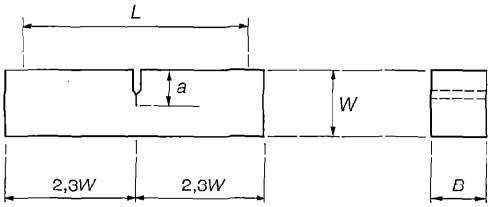
6.1.4 In each case the notch is to be positioned at the centre of the loading span; its root radius is not to exceed 0,10 mm. The notch is to be extended by the generation of a fatigue crack to give an effective crack length of the dimension *a*. For this purpose, the fatigue stress ratio, R_1, is to be within the range 0 to 0,1 and the fatigue intensity is not to exceed $0{,}63\sigma_y B^{1/2}$ where σ_y is the 0,2 per cent proof stress at the test temperature.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.



B = thickness
W = width = $2B$
a = effective crack length = $0{,}45W$ to $0{,}55W$
L = loading span = $4W$

Fig. 2.6.1
Outline dimensions of the preferred specimen



B = thickness
W = width = B
a = effective crack length (to be agreed between the purchaser and manufacturer)
L = loading span = $4W$

Fig. 2.6.2
Outline dimensions of the subsidiary specimen

6.2 Test equipment

6.2.1 Whenever possible, tests are to be made using machines operating under displacement control. The type of control is to be recorded.

6.2.2 The test equipment is to be calibrated annually.

6.2.3 The crack opening displacement gauge is to have an accuracy of at least one per cent. It is to be calibrated at least once every day of testing and at intervals of no more than 10 tests. It should be demonstrated that the calibration is satisfactory for the test conditions.

6.3 Testing procedures

6.3.1 Tests are to be made in a recognised test house in accordance with a nationally accepted standard.

6.3.2 Unless otherwise agreed, all tests on unwelded wrought material are to be made on specimens taken transverse to the principal working direction and are to be through-thickness notched.

6.3.3 Where tests are made on weld material, the fatigue crack should be arranged to sample the maximum amount of unrefined weld metal.

6.3.4 Where tests are made on the Heat Affected Zone (H.A.Z.) of a weld, a K or single bevel weld preparation is recommended. The region of lowest fracture toughness in the Heat Affected Zone should be identified for the particular steel and weld procedure by means of preliminary tests. The fatigue crack is to be accurately positioned to sample as high a proportion of this critical region as possible and after testing has been completed, the specimen is to be sectioned to check that this has been achieved. Sufficient tests should be made to ensure that the critical region has been sampled in at least three specimens.

6.3.5 At least three valid tests are to be made for each material condition. Invalid tests are to be disregarded and the tests repeated.

6.3.6 Local pre-compression of the test specimen ahead of the notch is acceptable in order to provide an acceptably even fatigue crack front.

6.3.7 The temperature of the test piece is to be measured to within ±2°C over the range minus 196°C to +200°C and to within ±5°C outside this range. The temperature should be measured at a point on the specimen not farther than 2 mm away from the crack tip.

6.4 Validity requirements

6.4.1 The test is to be regarded as invalid if:

(a) the fatigue crack front is not in a single plane;
(b) any part of the fatigue crack surface lies in a plane whose angle with the plane of the notch exceeds 10°;
(c) the length of any part of the fatigue crack is less than $0{,}025W$ or 1,25 mm, whichever is the greater;
(d) the difference between the maximum and minimum lengths of the fatigue crack exceeds $0{,}1W$;
(e) the difference between any two of the lengths of the fatigue crack at $0{,}25B$, $0{,}5B$ and $0{,}75B$ exceeds $0{,}05W$.

6.4.2 In addition, for tests on welds and Heat Affected Zones (H.A.Z.), the following criteria are to be complied with:

(a) Weld metal. The fatigue crack front shall not extend outside the weld metal deposit and 80 per cent should be within 2 mm of the fusion line.
(b) Grain coarsened H.A.Z.. The fatigue crack should be within 0,5 mm of the fusion line and should sample all of the grain coarsened H.A.Z. present. However, if fusion line irregularities prevent this, a sample including as much grain coarsened H.A.Z. as possible may be accepted.
(c) Subcritical/intercritical H.A.Z. boundary. The fatigue crack is to sample the boundary between the subcritical and intercritical regions of the H.A.Z. However, if fusion line irregularities prevent this, a sample including as much relevant microstructure as possible may be accepted.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

6.5 Test reports

6.5.1 The test report is to include:

(a) details of the material, its condition and size;
(b) the thickness and width of the test specimen;
(c) the fatigue pre-cracking conditions;
(d) the test temperature and environment;
(e) the test machine control system and rate of change of displacement or load;
(f) crack length measurements;
(g) force/displacement records, preferably in the form of an autographic record;
(h) the critical crack opening displacement;
(j) a photograph of the fracture;
(k) any observation on the fracture surface.

■ *Section 7* Bend tests

7.1 Dimensions of test specimens

7.1.1 Flat bend test specimens are to be of rectangular cross-section with dimensions as defined in Fig. 2.7.1.

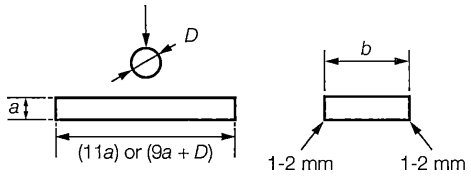


Fig. 2.7.1 Bend test specimen

7.1.2 For plates, sections and strip the dimensions shall be full thickness and width 30 mm. Where the rolled thickness exceeds 25 mm the compression face may be reduced to 25 mm.

7.1.3 For forgings, castings and semi-finished products the thickness shall be 20 mm and width 25 mm.

7.1.4 Butt weld face and root bend test specimens are to be 30 mm in width and of the full plate thickness. Where the thickness exceeds 25 mm, two side bend test specimens may be tested in place of the face and root specimens specified. The side bend specimens should be 10 mm minimum thickness. The upper and lower surfaces of the weld are to be filed, ground or machined flush with the surface of the plate.

7.1.5 The edges on the tension side of bend samples are to be rounded to a radius of 1 to 2 mm.

7.2 Testing procedures

7.2.1 The bend sample is plastically deformed by plunging a mandrel between two fixed points as shown in Fig. 2.7.2.

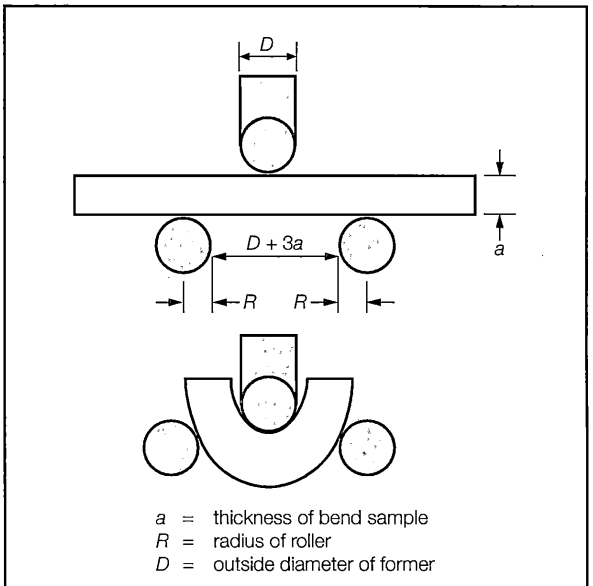

Fig. 2.7.2 Bend test

7.2.2 For aluminium welds a guided bend is required to ensure even deformation as shown in Fig. 2.7.3.

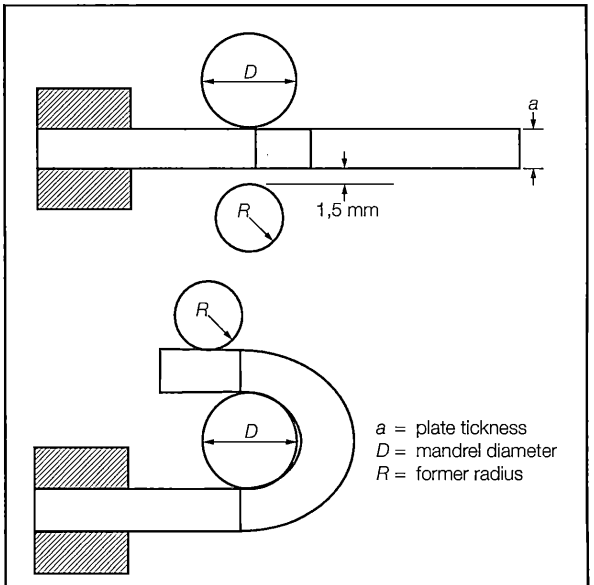

Fig. 2.7.3 Guide bend test for aluminium

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

7.2.3 Bend tests are to be conducted at ambient temperature at the highest convenient rate of bending (but not impact).

Section 8
Corrosion tests

8.1 Intergranular corrosion test

8.1.1 For all products other than pipes, the material for the test specimens is to be taken adjacent to that for the tensile test and is to be machined to suitable dimensions for either a round or rectangular section bend test. The diameter or thickness is to be not more than 12 mm, and the total surface area is to be between 1500 mm^2 and 3500 mm^2.

8.1.2 For pipes with an outside diameter not exceeding 40 mm, the test specimens are to consist of a full cross-section. For larger pipes, the test specimens are to be cut as circumferential strips of full wall thickness and having a width of not less than 12,5 mm. In both cases the total surface area is to be between 1500 mm^2 and 3500 mm^2.

8.1.3 Specimens are to be heated to a temperature of 700 ± 10°C for 30 minutes, followed by rapid cooling in water. They are then to be placed on a bed of copper turnings (50 g per litre of test solution) and immersed for 15 to 24 hours in a boiling solution of the following composition:

- 100 g of hydrated copper sulphate granules ($CuSO_4 \cdot 5H_2O$)
- 184 g (100 ml) sulphuric acid (density 1,84 g/ml) added dropwise to distilled water to make 1 litre of solution.

Precautions are to be taken during boiling to prevent concentration of the solution by evaporation.

8.1.4 After immersion, the full cross-section test specimens from pipes are to be subjected to a flattening test in accordance with Ch 2,4.2. All other test specimens are to be bent, at ambient temperature, through 90° over a former with a diameter equal to twice the diameter or thickness of the test specimen.

8.1.5 After flattening or bending, the test specimens are to be free from cracks on the outer, convex surface.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Rolled Steel Plates, Strip, Sections and Bars

Section

1 **General requirements**

2 **Normal strength steels for ship and other structural applications**

3 **Higher strength steels for ship and other *structural applications***

4 **Steels for boilers and pressure vessels**

5 **Steels for *machinery fabrications***

6 **Ferritic steels for low temperature service**

7 **Austenitic and duplex stainless steels**

8 **Plates with specified through thickness properties**

9 **Bars for welded chain cables**

10 **High strength quenched and tempered steels for welded structures**

Section 1 General requirements

1.1 Scope

1.1.1 This Section gives the general requirements for hot rolled plates and sections intended for use in the construction of ships, other marine structures, machinery, boilers and pressure vessels.

1.1.2 This Chapter is not applicable to hot rolled bars intended for the manufacture of bolts, plain shafts, etc., by machining operations only. Where used for this purpose, hot rolled bars are to comply with the requirements of Chapter 5.

1.1.3 Plate and strip which is hot coiled after rolling and subsequently uncoiled, cold flattened and cut to the required dimensions are also subject to the appropriate requirements of this Chapter.

1.1.4 Plates, strip, sections and bars are to be manufactured and tested in accordance with the requirements of Chapters 1 and 2, the general requirements of this Section and the appropriate specific requirements given in Sections 2 to 10.

1.1.5 As an alternative to 1.1.4, materials which comply with National or proprietary specifications may be accepted, provided that these specifications give equivalence to the requirements of this Chapter or are approved for a specific application. Particular attention is to be taken of the minimum required under thickness tolerance, *see* 1.5. Generally, survey and certification of such materials are to be carried out in accordance with the requirements of Chapter 1.

1.1.6 Steels intended for high heat input welding above 50 kJ/cm are to be specially approved. Approval will be indicated on the manufacturer's approval certificate by adding a high heat input welding notation to the grade approved e.g. EH36-W300, *indicating approval up to 300 kJ/cm.*

1.2 Steel with guaranteed through thickness *properties – 'Z' grade steel*

1.2.1 When plate material, intended for welded construction, will be subject to significant strains in a direction perpendicular to the rolled surfaces, it is recommended that consideration be given to the use of special plate material with specified through thickness properties, 'Z' grade steel. These strains are usually associated with thermal contraction and restraint during welding, particularly for full penetration 'T'-butt welds, but may also be associated with loads applied in service or during construction. Where these strains are of sufficient magnitude, lamellar tearing may occur. Requirements for 'Z' grade plate material are detailed in Section 8. It is the responsibility of the fabricator to make provision for the use of this material.

1.2.2 Steels intended to have guaranteed through thickness properties will include the supplementary suffix Z25 or Z35 in the designation, for example: LR DH36 Z35.

1.3 Manufacture

1.3.1 All materials are to be manufactured at works which have been approved by LR for the type and grade of steel which is being supplied and for the relevant steelmaking and processing route.

1.3.2 Steel is to be cast in metal ingot moulds or by the continuous casting process. The size of the ingot, billet or slab is to be proportional to the dimensions of the final product such that the reduction ratio is normally to be at least 3 to 1. Sufficient discard is to be taken to ensure soundness in the portion used for further processing.

1.3.3 The cast analysis to be used for certification purposes is to be determined after all alloying additions have been carried out and sufficient time allowed for such an addition to homogenise.

1.3.4 Material may be supplied either as-rolled, normalised, normalising rolled, or thermomechanically controlled rolled. The following definitions apply:

(a) As-rolled (AR) refers to rolling of steel at high temperature followed by air cooling. The rolling and finishing temperatures are typically in the austenite recrystallisation region and above the normalising temperature. The strength and toughness properties of steel produced by this process are generally less than those of steel heat treated after rolling or steel produced by advanced processes.

(b) Normalising (N) refers to an additional heating cycle of rolled steel above the critical temperature, A_{c3}, and in the lower end of the austenite recrystallisation region followed by air cooling. The process improves the mechanical properties of as-rolled steel by refining the grain size.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

(c) Normalising rolling (NR), also known as controlled rolling, is a rolling procedure in which the final deformation is carried out in the normalising temperature range, resulting in a material condition generally equivalent to that obtained by normalising.

(d) Thermomechanically controlled rolling (TM) is a procedure which involves the strict control of both the steel temperature and the rolling reduction. Generally a high proportion of the rolling reduction is carried out close to the A_{r3} temperature and may involve the rolling in the dual phase temperature region. Unlike normalising rolling the properties conferred by TM (TMCP) cannot be reproduced by subsequent normalising or other heat treatment. The use of accelerated cooling on completion of TM may also be accepted subject to the special approval by LR.

(e) Accelerated Cooling, (AcC) is a process which aims to improve mechanical properties by controlled cooling with rates higher than air cooling immediately after the final TM operation. Direct quenching is excluded from accelerated cooling. The material properties conferred by TM and AcC cannot be reproduced by subsequent normalising or other austenitising heat treatment.

(f) Quenching and Tempering (QT),is a heat treatment process in which steel is heated to an appropriate temperature above the A_{c3} and then cooled with an appropriate coolant for the purpose of hardening the microstructure, followed by tempering, a process in which the steel is re-heated to an appropriate temperature, not higher than the A_{c1} to restore the toughness properties by improving the microstructure.

1.3.5 Where material is being produced by a normalising rolling or a thermomechanically controlled process (T.M.) an additional program of tests for approval is to be carried out under the supervision of the Surveyors and the results are to be to the satisfaction of Lloyd's Register (hereinafter referred to as 'LR').

1.3.6 Weldable high strength steels may be supplied in the quenched and tempered condition for other marine structures, *see* Section 10.

1.4 Quality of materials

1.4.1 Surface and internal imperfections not prejudicial to the proper application of the steel are not, except by special agreement, to be grounds for rejection. Where necessary, suitable methods of non-destructive examination may be used for the detection of harmful surface and internal defects. The extent of this examination, together with an appropriate acceptance standard, is to be agreed between the purchaser, steelmaker and Surveyor and is to be included in the manufacturing specification.

1.5 Dimensional tolerances

1.5.1 For materials intended for hull structural purposes as detailed in Sections 2, 3 and 10, the under thickness tolerance of plates, strip and wide flats is not to exceed 0,3 mm.

1.5.2 The minus tolerance on sections (except for wide flats) is to be in accordance with the requirements of a recognised National or International Standard.

1.5.3 The attention of Shipbuilders and Owners is to be drawn to the fact that when thickness gauging is carried out during the ship's life, estimation of the diminution of hull plating and structure will be based on the nominal thickness, this being the original approved thickness for the item of structure under consideration.

1.5.4 The under thickness tolerance acceptable for classification is to be considered as the lower limit of a range of thickness tolerance which could be found in the normal production of a conventional rolling mill manufacturing material, on average, to the nominal thickness.

1.5.5 The Shipbuilder and Owner may agree in individual cases whether they wish to specify a more stringent under thickness tolerance than that given in 1.5.1.

1.5.6 The minus tolerances for plates and wide flats intended for machinery structures are given in Section 5.

1.5.7 For materials intended for applications as detailed in Sections 4 and 6, no minus tolerance is permitted in the thickness of plates and strip. The minus tolerances on sections are to comply with the requirements of a recognised National or International Standard.

1.5.8 For the materials detailed in Section 7, the under thickness tolerance of material intended for use in the construction of cargo tanks is not to exceed 0,3 mm. For other applications, no minus tolerance is permitted in the thickness of plates and strip.

1.5.9 Dimensional tolerances for material detailed in Section 9 are given in Table 3.9.3.

1.5.10 The thickness of plates and strip is to be measured at random locations whose distance from a longitudinal edge is to be at least 10 mm. Local surface depressions resulting from imperfections and ground areas resulting from the elimination of defects may be disregarded provided that they are in accordance with the requirements of a recognised National or International Standard.

1.5.11 Tolerances relating to length, width, flatness and over thickness are to comply with a National or International Standard.

1.5.12 The responsibility for maintaining the required tolerances and making the necessary measurements rests with the manufacturer. Occasional checking by the Surveyor does not absolve the manufacturer from this responsibility.

1.6 Heat treatment

1.6.1 Acceptable conditions of supply are specified in subsequent Sections of this Chapter.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.6.2 The manufacturer is to carry out any heat treatment which may be necessary to prevent hydrogen cracking or to make the material in a safe condition for transit. The Surveyor is to be advised of any heat treatment proposed.

1.6.3 Where material is manufactured using a thermo-mechanically controlled process consideration must be given to the possibility of consequent reduction in mechanical properties if it is subjected to heating for forming or stress relieving or is welded using a high heat input.

1.7 Test material and mechanical tests

1.7.1 Depending on the type of product, provision is made in subsequent Sections of this Chapter for the testing of individual items or for batch testing. Where the latter is permitted, all materials in a batch presented for acceptance tests are to be of the same product form, (e.g. plates, flats, sections, etc.), from the same cast and in the same condition of supply.

1.7.2 The test samples are to be fully representative of the material and, where appropriate, are not to be cut from the material until heat treatment has been completed. The test specimens are not to be separately heat treated in any way.

1.7.3 The test material is to be taken from the thickest piece in each batch, *see* Ch 1, 4.1.

1.7.4 Test material is to be taken from the following positions:

(a) At the square cut end of plates and flats greater than 600 mm wide, approximately one-quarter width from an edge, *see* Fig. 3.1.1(a).

(b) For flats 600 mm or less in width, bulb flats and other solid sections, at approximately one-third of the width from an edge, *see* Fig. 3.1.1(b), (c) and (d). Alternatively, in the case of channels, beams or bulb angles, at approximately one-quarter of the width from the centreline of the web, *see* Fig. 3.1.1(c).

(c) For rectangular hollow sections, at approximately the centre of any side, *see* Fig. 3.1.1(e). For circular hollow sections, at any position on the periphery.

(d) For bars intended for purposes as detailed in Sections 2, 3, 5 and 9, at approximately one-third of the radius or half-diagonal from the outer surface, *see* Fig. 3.1.1(f). For smaller bars, the position of the test material is to be as close as is possible to the above.

(e) For bars intended for the applications detailed in Sections 4, 6 and 7 at approximately 12,5 mm below the surface. For bars up to 25 mm diameter, the test specimens may be machined coaxially.

(f) For plates and flats with thicknesses in excess of 40 mm, full thickness specimens may be prepared, but when instead a machined round specimen is used then the axis is to be located at a position lying one-quarter of the product thickness from the surface as shown in Fig. 3.1.1(g).

1.7.5 Tensile test specimens and impact test specimens, where required for the type and grade of product being supplied, are to be prepared from each item or batch of material submitted for acceptance.

1.7.6 Where the finished width of plates and flats is greater than 600 mm, the tensile test specimens are to be cut with their principal axes perpendicular to the final direction of rolling. For all other rolled products, the principal axes are to be parallel to the final direction of rolling.

1.7.7 The tensile test specimens are to be machined to the dimensions detailed in Ch 2,2.1.6 and 2.1.7.

1.7.8 Impact test specimens are to be cut with their principal axes either parallel (longitudinal test) or perpendicular (transverse test) to the final direction of rolling, as required by subsequent Sections of this Chapter. Where both longitudinal and transverse impact properties are shown for a particular grade, only the longitudinal test is required to be carried out, unless otherwise specified by the purchase order or subsequent Sections of this Chapter. However, for plates and wide flats, by certifying that the product meets the requirements of the Rules, the manufacturer guarantees that the acceptance values will be met if tested in the transverse direction. The Surveyor may request testing in this direction to confirm conformity.

1.7.9 Impact test specimens are to be of the Charpy V-notch type, machined to the dimensions detailed in Chapter 2. They are to be taken from a position within 2 mm of one of the rolled surfaces, except that for plates and sections over 40 mm thick, the axes of the test specimens are to be at one-quarter of the thickness from one of the rolled surfaces. For bars and other similar products the axes of the test specimens are to be as specified in 1.7.4(d).

1.7.10 Standard test specimens 10 mm square are to be used, except where the thickness of the material does not allow this size of test specimen to be prepared. In such cases the largest possible size of subsidiary test specimen, in accordance with Table 2.3.1 is to be prepared, with the notch cut on the narrow face. Alternatively, for material of suitable thickness, the rolled surfaces may be retained so that the test specimen width will be the full thickness of the material. In such cases the tolerances for width given in Table 2.3.1 in Chapter 2 are not applicable. The notch is to be cut in a face of the test specimen which was originally perpendicular to the rolled surface. The position of the notch is to be not nearer than 25 mm to a flame-cut or sheared edge.

1.7.11 Impact tests are not required when the nominal material thickness is less than 6 mm.

1.7.12 The test procedures used for all tensile and impact tests are to be in accordance with the requirements of Chapter 2.

1.8 *Visual and non-destructive examination*

1.8.1 Surface inspection and verification of dimensions are the responsibility of the steelmaker and are to be carried out on all material prior to despatch. Acceptance by the Surveyors of material later found to be defective shall not absolve the steelmaker from this responsibility.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

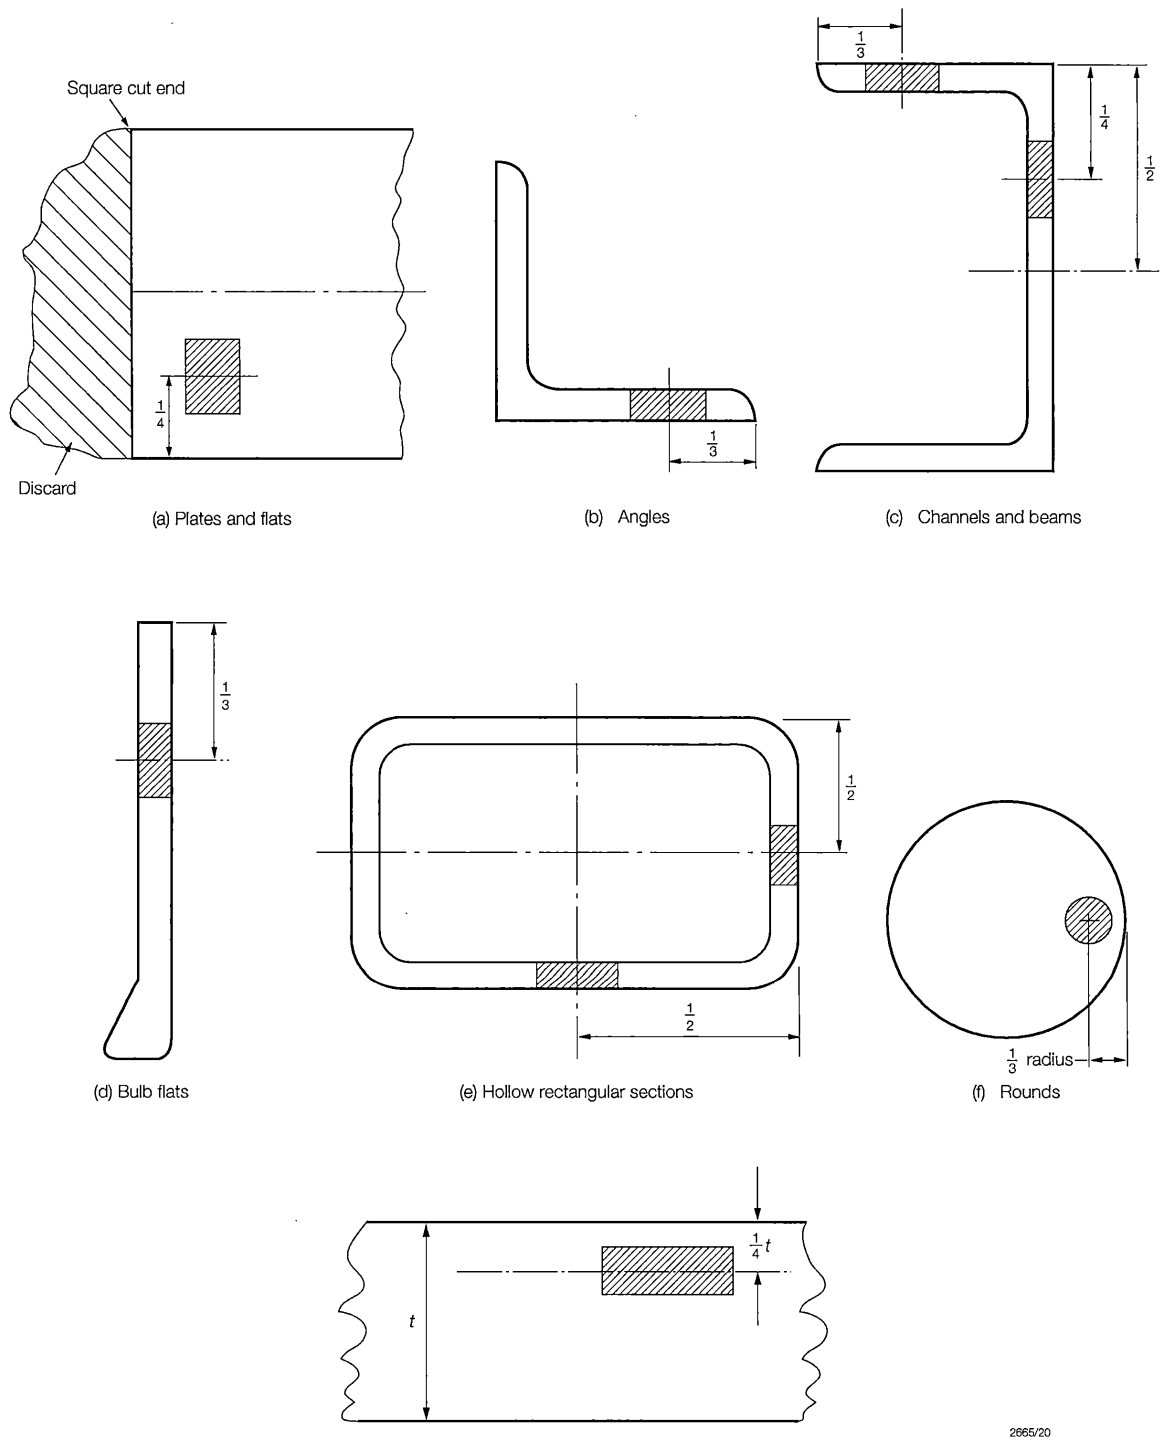

Fig. 3.1.1 Position of test material

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.8.2 With the exception of 'Z' grade plate material (*see* Section 8) and bars for offshore mooring cable (*see* Section 9), the non-destructive examination of materials is not required for acceptance purposes, *see also* 1.4.1. However, manufacturers are expected to employ suitable methods of non-destructive examination for the general maintenance of quality standards.

1.9 Rectification of defects

1.9.1 For materials intended for structural purposes as detailed in Sections 2, 3 and 5, surface defects may be removed by local grinding provided that:

(a) the thickness is in no place reduced to less than 93 per cent of the nominal thickness, but in no case by more than 3 mm,
(b) each single ground area does not exceed 0,25 m^2,
(c) the total area of local grinding does not exceed two per cent of the total surface,
(d) the ground areas have smooth transitions to the surrounding surface.

Where necessary, the entire surface may be ground to a maximum depth as given by the underthickness tolerances of the product. The extent of such rectification is to be agreed in each case with the Surveyors and is to be carried out under their supervision, unless otherwise agreed. They may request that complete removal of the defect is proven by suitable non-destructive examination of the affected area.

1.9.2 Surface defects which cannot be dealt with as in 1.9.1 may be repaired by chipping or grinding followed by welding, subject to the Surveyor's consent and under his supervision, provided that:

(a) after removal of the defect and before welding, the thickness of the item is in no place reduced by more than 20 per cent,
(b) each single weld does not exceed 0,125 m^2,
(c) the total area of welding does not exceed two per cent of the surface of the side involved,
(d) the distance between any two welds is not less than their average width,
(e) the welds are of reasonable size and made with an excess layer of beads which is then ground smooth to the surface level,
(f) elimination of the defect is proven by suitable non-destructive examination of the affected area,
(g) welding is carried out by an approved procedure and by competent operators using approved electrodes and the repaired area is ground smooth to the correct nominal thickness,
(h) when requested by the Surveyor, the item is normalised or otherwise suitably heat treated after welding and grinding, and
(j) at the discretion of the Surveyor, the repaired area is proven free from defects by suitable non-destructive examination.

1.9.3 For materials intended for applications as detailed in Sections 4, 6 and 7, surface defects may be removed by grinding in accordance with 1.9.1, except that when the thickness is reduced below that given in the approved plans, acceptance will be subject to special consideration. Weld repairs may also be carried out generally in accordance with 1.9.2, except that in all cases suitable heat treatment after welding and non-destructive testing of the repaired areas is required. The fabricator is to be advised regarding the position and extent of all repairs.

1.9.4 For plates which have been produced by a T.M. process or by normalising rolling, repair by welding will be approved by the Surveyor only after procedure tests have shown that the mechanical properties have not been impaired.

1.9.5 Cracks, shells, sand patches and sharp edged seams are always considered defects which would impair the end use of the product and which require rejection or repair irrespective of their size and number. The same applies to other imperfections exceeding the acceptable limits.

1.10 Identification of materials

1.10.1 Every finished item is to be clearly marked by the manufacturer in at least one place with LR's brand ℛ and the following particulars:

(a) The manufacturer's name or trade mark.
(b) The grade of steel. The designations given in subsequent Sections of this Chapter may be preceded by the letters 'LR' in order to fully describe the grade, e.g. LR A, LR 490FG. LR LT-FH40, LR 316L, etc.
(c) When the material complies with the requirements of Section 8, the grade is to include the suffix Z25 or Z35, e.g. LR AH36 Z35.
(d) Identification number and/or initials which will enable the full history of the item to be traced.
(e) If required by the purchaser, his order number or other identification mark.

The above particulars, but excluding the manufacturer's name or trade mark where this is embossed on finished products, are to be encircled with paint or otherwise marked so as to be easily recognisable.

1.10.2 Where a number of light materials are securely fastened together in bundles, the manufacturer may brand only the top piece of each bundle or, alternatively, a firmly fastened durable label containing the identification may be attached to each bundle.

1.10.3 In the event of any material bearing LR's brand failing to comply with the test requirements, the brand is to be unmistakably defaced, *see also* Ch 1,4.8.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.11 Certification of materials

1.11.1 Unless a LR certificate is specified in other parts of the Rules, a manufacturer's certificate validated by LR is to be issued (*see* Ch 1,3.1) and is to include the following particulars:

(a) Purchaser's name and order number.
(b) If known, the contract number for which the material is intended.
(c) Address to which material is dispatched.
(d) Name of steelworks.
(e) Description and dimensions of the material.
(f) Specification or grade of the steel.
(g) Identification number of piece, including test specimen number where appropriate.
(h) Cast number and chemical composition of ladle samples.
(j) Mechanical test results (not required on shipping statements).
(k) Condition of supply.

1.11.2 Before the test certificates are signed by the Surveyor, the steelmaker is required to provide a written declaration stating that the material has been made by an approved process, and that it has been subjected to and has withstood satisfactorily the required tests in the presence of the Surveyor, or an authorised deputy. The following form of declaration will be accepted if stamped or printed on each test certificate with the name of the steelworks and signed by an authorised representative of the manufacturer:

'We hereby certify that the material has been made by an approved process and satisfactorily tested in accordance with the Rules of Lloyd's Register'.

1.11.3 When steel is not produced at the works at which it is rolled, a certificate is to be supplied by the steelmaker stating the process of manufacture, the cast number and the chemical composition of ladle samples. The works at which the steel was produced must be approved by LR.

1.11.4 The manufacturer of coiled plate is required to issue a certificate which clearly identifies the material as coil. The certificate issued should include the words; 'Coils covered by this certificate require further processing at a works approved by Lloyd's Register before being certified as plate in accordance with the Rules of Lloyd's Register' in addition to the requirements of 1.11.2.

1.11.5 The supplier of plate cut from coil is required to issue a certificate which clearly identifies the product as finished plate meeting the requirements of the Rules in accordance with 1.11.2.

1.11.6 The form of certificates produced by computer systems is to be agreed with the Surveyor.

Section 2
Normal strength steels for ship and other structural applications

2.1 Scope

2.1.1 The requirements of this Section are primarily intended to apply to steel plates and wide flats not exceeding 100 mm in thickness and sections and bars not exceeding 50 mm in thickness in Grades A, B, D and E. For greater thicknesses, variations in the requirements may be permitted or required for particular applications.

2.1.2 Additional approval tests may be required to verify the suitability for forming and welding of Grade E plate exceeding 50 mm in thickness.

2.2 Manufacture and chemical composition

2.2.1 The method of deoxidation and the chemical composition of ladle samples are to comply with the requirements given in Table 3.2.1.

2.2.2 Small variations from the chemical compositions given in Table 3.2.1 may be allowed for Grade E steel in thicknesses exceeding 50 mm or when any Grade of steel is supplied in a thermo-mechanically controlled processed condition, provided that these variations are documented and approved in advance.

2.2.3 The manufacturer's declared analysis will be accepted subject to occasional checks if required by the Surveyors.

2.2.4 For plate supplied from coil, the chemical analysis can be transposed from the certificate of the coil manufacture onto the re-processor's certificate.

2.3 Condition of supply

2.3.1 All materials are to be supplied in a condition complying with the requirements given in Table 3.2.2. Where alternative conditions are permitted these are at the option of the steelmaker, unless otherwise expressly stated in the order for the material, but a steelmaker is to supply materials only in those conditions for which he has been approved by LR.

2.3.2 Where normalising rolling and thermomechanically controlled rolling (T.M.) processes are used, it is the manufacturer's responsibility to ensure that the programmed rolling schedules are adhered to. Where deviation from the programmed rolling schedule occurs, the manufacturer must ensure that each affected piece is tested and that the local Surveyor is informed.

2.3.3 If a steel product supplied in the T.M. condition is to be subjected to heating for forming or stress relieving or is to be welded by a high energy input process, consideration must be given to the possibility of a consequent reduction in mechanical properties.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 3.2.1 Chemical composition and deoxidation practice

Grade	A	B	D	E
Deoxidation	For $t \leq 50$ mm: Any method (for rimmed steel, *see* Note 1)	For $t \leq 50$ mm: Any method except rimmed steel	For $t \leq 25$ mm: Killed	Killed and fine grain treated with aluminium
	For $t > 50$ mm: Killed	For $t > 50$ mm: Killed	For $t > 25$ mm: Killed and fine grain treated with aluminium	
Chemical composition % (*see* Note 5)				
Carbon	0,21 max. (*see* Note 2)	0,21 max.	0,21 max.	0,18 max.
Manganese	2,5 x C% min.	0,80 min. (*see* Note 3)	0,60 min.	0,70 min.
Silicon	0,50 max.	0,35 max.	0,10 – 0,35	0,10 – 0,35
Sulphur	0,035 max.	0,035 max.	0,035 max.	0,035 max.
Phosphorus	0,035 max.	0,035 max.	0,035 max.	0,035 max.
Aluminium (acid soluble)	—	—	0,015 min. (*see* Note 4)	0,015 min. (*see* Note 4)
	Carbon + $^1/_6$ of the manganese content is not to exceed 0,40%			

NOTES
1. For Grade A, rimmed steel may only be accepted for sections up to a maximum thickness of 12,5 mm, provided that it is stated on the test certificates or shipping statements to be rimmed steel.
2. The maximum carbon content for Grade A steel may be increased to 0,23% for sections.
3. Where Grade B is impact tested the minimum manganese content may be reduced to 0,60%.
4. The total aluminium content may be determined instead of the acid soluble content. In such cases the total aluminium content is to be not less than 0,020%.
5. Where additions of any other elements are made as part of the steelmaking practice, the content is to be recorded.

Table 3.2.2 Condition of supply

Grade	Thickness, mm	Conditions of supply			
A and B	≤50	Any			(*see* Note 1)
	>50 ≤100	N	NR	TM	(*see* Note 2)
D	≤35	Any			(*see* Note 1)
	>35 ≤100	N	NR	TM	(*see* Note 3)
E	≤100	N		TM	(*see* Note 4)

N = normalised
NR = normalising rolled
TM = thermomechanically controlled-rolled

NOTES
1. 'Any' includes as-rolled, normalised, normalising rolled and thermomechanically controlled-rolled.
2. Plates, wide flats, sections and bars may be supplied in the as-rolled condition, subject to special approval from LR.
3. Sections in Grade D steel may be supplied in thicknesses greater than 35 mm in the as-rolled condition provided that satisfactory results are consistently obtained from Charpy V-notch impact tests.
4. Sections in Grade E steel may be supplied in the as-rolled and normalising rolled conditions provided that satisfactory results are consistently obtained from Charpy V-notch impact tests.

2.4 Mechanical tests

2.4.1 The results of all tensile tests and the average energy value from each set of three impact tests are to comply with the appropriate requirements given in Table 3.2.3 except where enhanced by the requirements of this Section.

2.4.2 With the exception given in 2.4.4, one tensile test is to be made for each batch presented unless the mass of finished material is greater than 50 tonnes, in which case one test is to be made from a different piece from each 50 tonnes or fraction thereof. Additional tests are to be made for every variation of 10 mm in the thickness or diameter of products from the same cast. For sections, the thickness to be considered is the thickness of the product at the point at which samples are taken for mechanical tests. A piece is to be regarded as the rolled product from a single slab or billet, or from a single ingot if this is rolled directly into plates, strip, sections or bars.

2.4.3 For Grades A and B where plate is supplied from coil, results of the tensile test can be transposed from the certificate of the coil manufacture onto the certificate issued by the re-processor. If the coil mass exceeds 50 tonnes, testing will additionally be required from two locations representing the start and end of the coil. For Grades D and E, the mechanical properties must be sampled from the de-coiled plate in accordance with the frequency specified in the Rules.

2.4.4 For plates of thickness exceeding 50 mm in Grade E steel, one tensile test is to be made on each piece.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 3.2.3 Mechanical properties for acceptance purposes

Grade	Yield stress N/mm^2 minimum	Tensile strength N/mm^2	Elongation on $5{,}65\sqrt{S_o}$ % minimum	Charpy V-notch impact test (*see* Notes 3, 4, 5, 6 and 7)		
				Thickness mm	Average energy J minimum	
					Longitudinal	Transverse (*see* Note 3)
A	235	400 – 520 (*see* Note 1)	22 (*see* Note 2)	≤50	27	20
B				>50 ≤70	34	24
D				>70 ≤100	41	27
E						

Impact tests are to be made on the various grades at the following temperatures:

A grade	not required
B grade	0°C
D grade	–20°C
E grade	–40°C

NOTES

1. For sections in Grade A, the upper limit of the tensile strength range may be exceeded at the discretion of the Surveyor.
2. For full thickness tensile test specimens with a width of 25 mm and a gauge length of 200 mm (*see* Fig. 2.2.4 in Chapter 2), the minimum elongation is to be:

Thickness mm	≤5	>5 ≤10	>10 ≤15	>15 ≤20	>20 ≤25	>25 ≤30	>30 ≤35	>35 ≤50
Elongation %	14	16	17	18	19	20	21	22

3. Tests are to be taken in the longitudinal direction. Normally, transverse test specimens are not required. Transverse test results for plates and wide flats are to be garenteed by the supplier.
4. *See* 2.4.5 and 2.4.6.
5. *See* 2.4.7.
6. *See* 1.7.11.
7. *See* 2.4.14.

2.4.5 For Grade A steel, Charpy V-notch impact tests are not required when the thickness does not exceed 50 mm, or up to 100 mm thick if the material is supplied in either the normalised or thermo-mechanically controlled-rolled condition and has been fine grain treated. However, the manufacturer should confirm, by way of regular in-house checks, that the material will meet a requirement of 27 J at +20°C. The results of these checks shall be reported to the Surveyor. The frequency of these checks should as a minimum be every 250 tonnes.

2.4.6 When Grade A steel is supplied in a thickness greater than 50 mm and either, in the normalising rolled condition, or when special approval has been given to supply in the as-rolled condition, a set of three impact test specimens is to be tested from each batch of 50 tonnes or fraction thereof.

2.4.7 Impact tests are not required for Grade B steel of 25 mm or less in thickness. However, the manufacturer is to confirm, by way of regular in-house tests, and on occasional material selected by the Surveyor, that the material meets the requirement in Table 3.2.3. The results of the tests are to be reported to the Surveyor. The frequency of the in-house checks are to be, as a minimum, one set of three impact test specimens for every 250 tonnes.

2.4.8 For Grade B steels of thicknesses above 25 mm, supplied in the as-rolled or normalising rolled condition, one set of three impact test specimens is to be made from the thickest item in each batch presented. If the mass of finished material is greater than 25 tonnes, one extra set of tests is to be made from a different piece from each 25 tonnes or fraction thereof.

2.4.9 For Grade B steels of thicknesses above 25 mm, supplied in the furnace normalised or thermomechanically controlled-rolled condition, one set of three impact test specimens is to be made from the thickest item in each batch presented. If the mass of finished material is greater than 50 tonnes, one extra set of tests is to be made from a different piece from each 50 tonnes or fraction thereof.

2.4.10 For Grade D steels supplied in the as-rolled or normalising rolled condition, one set of three impact test specimens is to be made from the thickest item in each batch presented. If the mass of finished material is greater than 25 tonnes, one extra set of tests is to be made from a different piece from each 25 tonnes or fraction thereof.

2.4.11 For Grade D steels, supplied in the furnace normalised or thermomechanically controlled-rolled condition, one set of three impact test specimens is to be made from the thickest item in each batch presented. If the mass of finished material is greater than 50 tonnes, one extra set of tests is to be made from a different piece from each 50 tonnes or fraction thereof.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2.4.12 For plates in Grade E steel, one set of three impact test specimens is to be made from each piece. For bars and sections in Grade E steel, one set of three test specimens is to be made from each 25 tonnes or fraction thereof. When, subject to the special approval of LR, sections are supplied in the as-rolled or normalising rolled conditions, one set of impact tests is to be taken from each batch of 15 tonnes or fraction thereof.

2.4.13 The results of all tensile tests and the average energy values from each set of three impact tests are to comply with the appropriate requirements given in Table 3.2.3. For impact tests, one individual value may be less than the required average value provided that it is not less than 70 per cent of this average value. *See* Ch 1,4.6 for re-test procedures.

2.4.14 For batch tested Grade B and D steel plates supplied in a condition other than furnace normalised, with a thickness equal to, or greater than 25 mm and 12 mm respectively, and where the average value of one set of tests is less than 40 J, two further items from the same batch are to be selected and tested. If these fail to achieve an average of 40 J on either set, each individual piece of the heat is to be tested. The plates are acceptable provided they meet the requirements of Table 3.2.3. Additional testing is not required where the manufacturer can demonstrate to the satisfaction of the Surveyor that the plate was rolled outside the limits of the programmed rolling schedule. In this instance the plate should be rejected, *see also* 2.3.2.

2.4.15 Where standard subsidiary Charpy V-notch test specimens are necessary, *see* Ch 2,3.2.4.

2.5 Identification of materials

2.5.1 The particulars detailed in 1.10 are to be marked on all materials which have been accepted. Where a number of light materials are bundled, the bundle is to be identified in accordance with 1.10.2.

2.6 Certification of materials

2.6.1 At least two copies of each test certificate are to be provided. They are to be of the type and give the information detailed in 1.11 and, additionally, are to indicate if sections in Grade A steel of rimming quality have been supplied. As a minimum, the chemical composition is to include the contents of any grain refining elements used and the residual elements, as detailed in Table 3.2.1.

■ *Section 3*
Higher strength steels for ship and other structural applications

3.1 Scope

3.1.1 Provision is made for material to be supplied in four strength levels, 27S, 32, 36 and 40.

3.1.2 The required notch toughness is designated by subdividing the strength levels into Grades AH, DH, EH and FH.

3.1.3 For the designation to fully identify a steel and its properties the appropriate grade letters should precede the strength level number, e.g. AH32 or FH40.

3.1.4 The requirements of this Section are primarily intended to apply to plates, wide flats, sections and bars not exceeding the thickness limits given in Table 3.3.1. For greater thicknesses, variations in the requirements may be permitted or required for particular applications but a reduction of the required impact energy is not allowed.

Table 3.3.1 Maximum thickness limits

Steel designation				Maximum thickness mm	
				Plates and wide flats	Sections and bars
AH 27S AH 32 AH 36 AH 40	DH 27S DH 32 DH 36 DH 40	EH 27S EH 32 EH 36 EH40	FH27S FH32 FH36 FH40	100	50

3.1.5 It should be noted that the fatigue strength of weldments in steels of high strength levels may not be greater than those of steels of lower strength levels.

3.2 Alternative specifications

3.2.1 Steels differing from the requirements of this Section in respect of chemical composition, deoxidation practice, condition of supply or mechanical properties may be accepted subject to special approval by LR. Such steels are to be given a special designation, *see* 3.7.2.

3.3 Manufacture

3.3.1 All the grades of steel are to be in the killed and fine grain treated condition.

3.4 Chemical composition

3.4.1 The chemical compositions of ladle samples for all grades of steel are to comply with the requirements given in Table 3.3.2.

3.4.2 The carbon equivalent is to be calculated from the ladle analysis using the formula given below and is not to exceed the maximum value agreed between the fabricator and the steelmaker when the steel is ordered.

$$\text{Carbon equivalent} = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15}$$

For TM steels, the agreed carbon equivalent is not to exceed the values given in Table 3.3.3.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 3.3.2 Chemical composition

Grades	AH, DH, EH	FH
Carbon % max.	0,18	0,16
Manganese %	0,9 – 1,60 (*see* Note 1)	0,9 – 1,60
Silicon % max.	0,50	0,50
Phosphorus % max.	0,035	0,025
Sulphur % max.	0,035	0,025
Grain refining elements (*see* Note 2)		
Aluminium (acid soluble) %	0,015 min. (*see* Note 3)	
Niobium %	0,02 – 0,05	
Vanadium %	0,05 – 0,10	
Titanium %	0,02 max.	
Total (Nb + V + Ti) % (*see* Note 5)	0,12 max.	
Residual elements		
Nickel % max.	0,40	0,80
Copper % max.	0,35	0,35
Chromium % max.	0,20	0,20
Molybdenum % max.	0,08	0,08
Nitrogen % max.		0,009 (0,012 max. if Al is present)

NOTES
1. For AH grade steels in all strength levels and thicknesses up to 12,5 mm, the specified minimum manganese content is 0,70%.
2. The steel is to contain aluminium, niobium, vanadium or other suitable grain refining elements, either singly or in any combination. When used singly, the steel is to contain the specified minimum content of the grain refining element. When used in combination, the specified minimum content of each element is not applicable.
3. The total aluminium content may be determined instead of the acid soluble content. In such cases the total aluminium content is to be not less than 0,020%.
4. Alloying elements other than those listed above are to be included in the approved manufacturing specification.
5. The grain refining elements are to be in accordance with the approved specification.

Table 3.3.3 Carbon equivalent requirements for higher tensile strength steels up to 100 mm in thickness when supplied in the TM condition

Grade	Carbon Equivalent, max. (%)	
	$t \leq 50$	$50 < t \leq 100$
AH 27S DH 27S EH 27S FH 27S	0,36	0,38
AH 32 DH 32 EH 32 FH 32	0,36	0,38
AH 36 DH 36 EH 36 FH 36	0,38	0,40
AH 40 DH 40 EH 40 FH 40	0,40	0,42

NOTE
t = thickness, in mm.

3.4.3 The cold cracking susceptibility, P_{cm}, may be used instead of the carbon equivalent for evaluating weldability, in which case the following formula is to be used for calculating the P_{cm} from the ladle analysis:

$$P_{cm} = C + \frac{Si}{30} + \frac{Mn + Cr + Cu}{20} + \frac{Ni}{60} + \frac{Mo}{15} + \frac{V}{10} + 5B$$

The maximum allowable P_{cm} is to be agreed with LR and is to be included in the manufacturing specification and reported on the certificate.

3.4.4 Small deviations in chemical composition from that given in Table 3.3.2 for plates exceeding 50 mm in thickness in Grades EH36, EH40, FH36 and FH40 may be approved provided that these deviations are documented and approved in advance.

3.4.5 Where the grain refining elements Niobium, Titanium and Vanadium are used either singly or in combination, the chemical composition is to be specifically approved for each Grade in combination with the rolling procedure to be used.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

3.4.6 When any grade is supplied in an approved thermomechanically controlled processed condition, variations in the specified chemical composition may be considered, provided that these variations are documented and approved in advance.

3.4.7 For plate supplied from coil, the chemical analysis can be transposed from the certificate of the coil manufacture onto the re-processor's certificate.

3.5 Condition of supply

3.5.1 All materials are to be supplied in a condition complying with the requirements given in Table 3.3.4 or Table 3.3.5. Where alternative conditions are permitted, these are at the option of the steelmaker, unless otherwise expressly stated in the order for the material.

3.5.2 Where normalising rolling and thermomechanically controlled rolling (T.M.) processes are used, it is the manufacturer's responsibility to ensure that the programmed rolling schedules are adhered to. Where deviation from the programmed rolling schedule occurs, the manufacturer must ensure that each affected piece is tested and that the local Surveyor is informed.

3.5.3 The use of precipitation hardening steels is not acceptable, except where such hardening is incidental to the use of grain refining elements.

3.6 Mechanical tests

3.6.1 The results of all tensile tests and the average energy value from each set of three Charpy V-notch impact tests are to comply with the appropriate requirements given in Table 3.3.6 except where enhanced by the requirements of this Section.

Table 3.3.4 Conditions of supply for plates and wide flats

Grade	Grain refining practice (*see* Note 1)	Thickness range mm	Conditions of supply (*see* Note 2)				
AH 27S AH 32 AH 36	Al or Al + Ti	≤20	AR	N	NR	TM	
		>20 ≤100	–	N	NR	TM	(*see* Note 3)
	Nb or V or Al + (Nb or V) or Al + (Ti) + (Nb or V)	≤12,5	AR	N	NR	TM	
		>12,5 ≤100	–	N	NR	TM	
AH 40	Any practice	≤12,5	AR	N	NR	TM	
		>12,5 ≤50	–	N	NR	TM	
		>50 ≤100	–	N	–	TM	QT
DH 27S DH 32 DH 36	Al or Al + Ti	≤20	AR	N	NR	TM	
		>20 ≤100	–	N	NR	TM	(*see* Note 4)
	Nb or V or Al + (Nb or V) or Al + (Ti) + (Nb or V)	≤12,5	AR	N	NR	TM	
		>12,5 ≤100	–	N	NR	TM	
DH 40	Any practice	≤50	–	N	NR	TM	
		>50 ≤100	–	N	–	TM	QT
EH 27S EH 32 EH 36	Any practice	≤100	–	N	–	TM	
EH 40	Any practice	≤100	–	N	–	TM	QT
FH 27S FH 32 FH 36 FH 40	Any practice	≤100	–	N	–	TM	QT

NOTES
1. Grain refining elements used singly or in any combination, require specific approval from Materials and NDE Department, London office.
2. AR = as-rolled N = furnace normalised NR = normalising rolled
   TM = *thermomechanically controlled-rolled* QT = *quenched and tempered*
3. Material up to 35 mm thick may be supplied in the as-rolled condition provided that prior approval has been obtained from LR.
4. Material up to 25 mm thick may be supplied in the as-rolled condition provided that prior approval has been obtained from LR.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 3.3.5 Conditions of supply for sections and bars

Grade	Grain refining practice (*see* Note 1)	Thickness range mm	Conditions of supply (*see* Note 2)			
AH 27S AH 32 AH 36	Al or Al + Ti	≤20	Any			
		>20 ≤50	N	NR	TM	(*see* Note 3)
	Nb or V or Al + Nb or Al + V or Al + (Ti) + (Nb or V)	≤12,5	Any			
		>12,5 ≤50	N	NR	TM	(*see* Note 3)
AH 40	Any practice	≤12,5	Any			
		>12,5 ≤50	N	NR	TM	
DH 27S DH 32 DH 36	Al or Al + Ti	≤20	Any			
		>20 ≤50	N	NR	TM	(*see* Note 3)
	Nb or V or Al + Nb or Al + V or Al + (Ti) + (Nb or V)	≤12,5	Any			
		>12,5 ≤50	N	NR	TM	(*see* Note 3)
DH 40	Any practice	≤50	N	NR	TM	
EH 27S EH 32 EH 36	Any practice	≤50	N	TM		(*see* Notes 3 and 4)
EH 40	Any practice	≤50	N	TM	QT	
FH 27S FH 32 FH 36 FH 40	Any practice	≤50	N	TM	QT	(*see* Note 4)

NOTES
1. Grain refining elements used singly or in any combination require specific approval from Materials and NDE Department, London Office.
2. N = furnace normalised NR = normalising rolled
   TM = thermomechanically controlled-rolled QT = quenched and tempered
3. Subject to the special approval of LR, sections may be supplied in the as-rolled condition provided satisfactory results are consistently obtained from Charpy V-notch impact tests.
4. Subject to the special approval of LR, sections may be supplied in the NR condition.

3.6.2 For steels in the as-rolled, normalised, normalising rolled or T.M. conditions, one tensile test is to be made for each batch of 50 tonnes or fraction thereof. Additional tests are to be made for every variation of 10 mm in the thickness or diameter of products from the same cast.

3.6.3 Where plate is supplied from coil, both the tensile tests and the Charpy V-notch tests are to be taken from the de-coiled plate in accordance with the frequency specified for the Grade as required by this Section.

3.6.4 For steels in the quenched and tempered condition a tensile test is to be made on each plate as heat treated. For continuously heat treated plates, one tensile test is to be made for each 50 tonnes or fraction thereof from a single cast. Additional tests are to be made for every variation of 10 mm in the thickness of the products from a single cast. The tensile test specimens are to be taken with their axes transverse to the main direction of rolling.

3.6.5 For products in the AH and DH grades, at least one set of three impact tests is to be made on the thickest piece in each batch of 50 tonnes when supplied in either the normalised or thermomechanically controlled condition. When the products are supplied in the as-rolled or normalising rolled conditions a set of impact test specimens is to be taken from a different piece from each 25 tonnes or fraction thereof. When supplied in the quenched and tempered condition, a set of impact tests is to be made on each length as heat treated. Test specimens from the quenched and tempered plates are to have their axes transverse to the main rolling direction.

3.6.6 For plates and wide flats in the EH and FH grades supplied in the normalised or thermomechanically controlled conditions, one set of impact tests is to be made on each piece. For plates supplied in the quenched and tempered condition a set of impact tests is to be made on each length as heat treated. Test specimens from the quenched and tempered plates are to have their axes transverse to the main rolling direction.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 3.3.6 Mechanical properties for acceptance purposes (*see* Note 1)

Grades (*see* Note 3)	Yield Stress N/mm^2 min.	Tensile Strength N/mm^2	Elongation on $5{,}65\sqrt{S_o}$ % min. (*see* Note 2)	Charpy V-notch impact tests (*see* Notes 3, 4 and 5) Average energy J minimum					
				$t \leq 50$ mm		$50 < t \leq 70$ mm		$70 < t \leq 100$ mm	
				Longitudinal	Transverse	Longitudinal	Transverse	Longitudinal	Transverse
AH 27S DH 27S EH 27S FH 27S	265	400 – 530	22	27	20	34	24	41	27
AH 32 DH 32 EH 32 FH 32	315	440 – 570	22	31	22	38	26	46	31
AH 36 DH 36 EH 36 FH 36	355	490 – 630	21	34	24	41	27	50	34
AH 40 DH 40 EH 40 FH 40	390	510 – 650	20	39	26	46	31	55	37

Impact tests are to be made on the various grades at the following temperatures:

AH grades 0°C
DH grades –20°C
EH grades –40°C
FH grades –60°C

NOTES

1. The requirements for products thicker than those detailed in the table are subject to agreement, *see* 3.1.4.
2. For full thickness tensile test specimens with a width of 25 mm and a gauge length of 200 mm, *see* Fig. 2.2.4 in Chapter 2, the minimum elongation is to be:

Thickness mm		≤5	>5 ≤10	>10 ≤15	>15 ≤20	>20 ≤25	>25 ≤30	>30 ≤40	>40 ≤50	>50
Elongation %	Strength levels 27S, 32	14	16	17	18	19	20	21	22	To be specially agreed
	Strength level 36	13	15	16	17	18	19	20	21	
	Strength level 40	12	14	15	16	17	18	19	20	

3. Subject to special approval by LR, the minimum tensile strength may be reduced to 470 N/mm^2, for grades AH36, DH36, EH36 and FH36, in the TM condition when micro-alloying elements Nb, Ti or V are used singly and not in combination and provided the yield to tensile strength ratio does not exceed 0,89. For plates with a thickness ≤12 mm, the yield to tensile strength ratio is to be specially considered.
4. Tests are to be taken in the longitudinal direction. Normally, transverse test specimens are not required. Transverse test results for plates and wide flats are to be guaranteed by the supplier.
5. *See* 1.7.11
6. *See* 3.6.8.

3.6.7 For sections and bars in the EH and FH grades supplied in the normalised or thermomechanically controlled conditions, one set of impact tests is to be made on the thickest piece in a batch not exceeding 25 tonnes. For sections supplied in the as-rolled or normalising rolled conditions the batch size is not to exceed 15 tonnes.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

3.6.8 For batch tested plates in a condition other than furnace normalised, with a thickness equal to 12 mm or greater, and where the average value of one set of tests is less than 50 J, two further items from the same batch are to be selected and tested. If these fail to achieve an average of 50 J on either set, each individual piece of the heat is to be tested. The plates are acceptable provided they meet the requirements of Table 3.3.6. Additional testing is not required where the manufacturer can demonstrate to the satisfaction of the Surveyor that the plate was rolled outside the limits of the programmed rolling schedule. In this instance the plate should be rejected, *see also* 3.5.2.

3.6.9 Where standard subsidiary impact specimens are necessary, *see* Ch 2,3.2.4.

3.7 Identification of materials

3.7.1 The particulars detailed in 1.10 are to be marked on all materials which have been accepted and, for ease of recognition, are to be encircled or otherwise marked with paint. Where a number of light products are bundled, the bundle is to be identified in accordance with 1.10.2.

3.7.2 Steels which have been specially approved and which differ from the requirements of this Section are to have the letter 'S' after the agreed identification mark.

3.8 Certification of materials

3.8.1 At least two copies of each test certificate are to be provided. They are to be of the type and give the information detailed in 1.11 and, additionally, are to state the specified maximum carbon equivalent. As a minimum, the chemical composition is to include the contents of any grain refining elements used and of the residual elements.

3.8.2 For steels which have been specially approved, the agreed identification mark, the specified minimum yield stress and, if applicable, the contents of alloying elements are additionally to be stated on the test certificate or shipping statement.

3.8.3 The steelmaker is to provide the Surveyor with a written declaration as detailed in 1.11.2.

■ *Section 4*
Steels for boilers and pressure vessels

4.1 Scope

4.1.1 Provision is made in this Section for carbon, carbon-manganese and alloy steels intended for use in the construction of boilers and pressure vessels. In addition to specifying mechanical properties at ambient temperature for the purposes of acceptance testing, these requirements also give details of appropriate mechanical properties at elevated temperatures which may be used for design purposes.

4.1.2 Where it is proposed to use a carbon or carbon-manganese steel with a specified minimum tensile strength intermediate to those given in this Section, corresponding minimum values for the yield stress, elongation and mechanical properties at elevated temperatures may be obtained by interpolation.

4.1.3 Carbon and carbon-manganese steels with a specified minimum tensile strength of greater than 490 N/mm^2 but not exceeding 520 N/mm^2 may be accepted, provided that details of the proposed specification are submitted for approval.

4.1.4 Where it is proposed to use alloy steels other than as given in this Section, details of the specification are to be submitted for approval. In such cases the specified minimum tensile strength is not to exceed 600 N/mm^2.

4.1.5 Materials intended for use in the construction of the cargo tanks and process pressure vessels storage tanks for liquefied gases and for other low temperature applications are to comply with the requirements of Section 6 or 7, as appropriate.

4.2 Manufacture and chemical composition

4.2.1 The method of deoxidation and the chemical composition of ladle samples are to comply with the appropriate requirements of Table 3.4.1.

4.2.2 For plate supplied from coil, the chemical analysis may be transposed from the certificate of the coil manufacture onto the re-processor's certificate.

4.3 Heat treatment

4.3.1 All materials are to be supplied in a condition complying with the requirements given in Table 3.4.2 except that, when agreed, material intended for hot forming may be supplied in the as-rolled condition.

4.4 Mechanical tests

4.4.1 For plates, a tensile test specimen is to be taken from one end of each piece when the mass does not exceed 5 tonnes and the length does not exceed 15 m. When either of these limits is exceeded, tensile test specimens are to be taken from both ends of each piece. A piece is to be regarded as the rolled product from a single slab or from a single ingot if this is rolled directly into plates.

4.4.2 For strip, tensile test specimens are to be taken from both ends of each coil.

4.4.3 Sections and bars are to be presented for acceptance test in batches containing not more than 50 lengths, as supplied. The material in each batch is to be of the same section size, from the same cast and in the same condition of supply. One tensile test specimen is to be taken from material representative of each batch, except that additional tests are to be taken when the mass of a batch exceeds 10 tonnes.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 3.4.1 Chemical composition and deoxidation practice

Grade of steel	Deoxidation	Chemical composition %						
Carbon and carbon-manganese steels		C max.	Si	Mn	P	S	Al	Residual elements
360 AR	Any method except rimmed steel	0,18	0,50 max.	0,40 – 1,20	0,040 max.		–	Cr 0,25 max. Cu 0,30 max. Mo 0,10 max. Ni 0,30 max. Total 0,70 max.
410 AR		0,21		0,40 – 1,30			–	
460 AR		0,23		0,80 – 1,50			–	
360	Any method except rimmed steel	0,17	0,35 max.	0,40 – 1,20	0,035 max.		–	
410		0,20		0,50 – 1,30			–	
460		0,20 (*see* Note 1)	0,40 max.	0,80 – 1,40			–	
490	Killed		0,10 – 0,50	0,90 – 1,60			–	
360 FG	Killed fine grained	0,17	0,35 max.	0,40 – 1,20	0,035 max.		(*see* Note 2)	
410 FG		0,20		0,50 – 1,30				
460 FG		0,20 (*see* Note 1)	0,40 max.	0,80 – 1,50				
490 FG			0,10 – 0,50	0,90 – 1,60				
510 FG		0,22						

Alloy steel		C	Si	Mn	P S	Al	Cr	Mo	Residual elements
13Cr Mo 45	Killed	0,10–0,18	0,15–0,35	0,4–0,8	0,035 max.	(*see* Note 3)	0,70–1,30	0,40–0,60	Cu 0,30 max.
11Cr Mo 910		0,08–0,18	0,15–0,50				2,00–2,50	0,90–1,10	Ni 0,30 max.

NOTES
1. For thicknesses greater than 30 mm, carbon 0,22% max.
2. Aluminium (acid soluble) 0,015% min. or
   Aluminium (total) 0,018% min.
   Niobium, vanadium or other suitable grain refining elements may be used either in place of or in addition to aluminium.
3. Aluminium (acid soluble or total) 0,020% max.

Table 3.4.2 Condition of supply

Grade of steel	Condition of supply
Carbon and carbon-manganese 360 AR to 460 AR	As-rolled Maximum thickness or diameter is 40 mm
Carbon and carbon-manganese 360 to 490	Normalised or normalised rolled
Carbon and carbon-manganese 360 FG to 510 FG	Normalised or normalised rolled
13Cr Mo 45	Normalised and tempered
11Cr Mo 910	Normalised and tempered

4.4.4 Where plates are required for hot forming and it has been agreed that the heat treatment will be carried out by the fabricator, the tests at the steelworks are to be made on material which has been cut from the plates and given a normalising and tempering heat treatment in a manner simulating the treatment which will be applied to the plates.

4.4.5 If required by the Surveyors or by the fabricator, test material may be given a simulated stress relieving heat treatment prior to the preparation of the test specimens. This has to be stated on the order together with agreed details of the simulated heat treatment and the mechanical properties which can be accepted.

4.4.6 The results of all tensile tests are to comply with the appropriate requirements given in Tables 3.4.3 to 3.4.5.

4.4.7 Where plate is supplied from coil, the tensile tests are to be taken from the de-coiled plate in accordance with the frequency specified for the Grade as required by this Section.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 3.4.3 Mechanical properties for acceptance purposes: carbon and carbon-manganese steels – As-rolled

Grade of steel	Thickness mm	Yield stress N/mm² minimum	Tensile strength N/mm²	Elongation on $5{,}65\sqrt{S_o}$ % minimum
360 AR	≤ 40	190	360–480	24
410 AR	≤ 40	215	410–530	22
460 AR	≤ 40	240	460–580	21

Table 3.4.4 Mechanical properties for acceptance purposes: carbon and carbon-manganese steels – Normalised or normalised rolled

Grade of steel	Thickness mm (*see* Note)	Yield stress N/mm² minimum	Tensile strength N/mm²	Elongation on $5{,}65\sqrt{S_o}$ % minimum
360	>3 ≤16	205	360 – 480	26
	>16 ≤40	195		26
	>40 ≤63	185		25
410	>3 ≤16	235	410 – 530	24
	>16 ≤40	225		24
	>40 ≤63	215		23
460	>3 ≤16	285	460 – 580	22
	>16 ≤40	255		22
	>40 ≤63	245		21
490	>3 ≤16	305	490 – 610	21
	>16 ≤40	275		21
	>40 ≤63	265		20
360 FG	>3 ≤16	235	360 – 480	26
	>16 ≤40	215		26
	>40 ≤63	195		25
410 FG	>3 ≤16	265	410 – 530	24
	>16 ≤40	245		24
	>40 ≤63	235		23
460 FG	>3 ≤16	295	460 – 580	22
	>16 ≤40	285		22
	>40 ≤63	275		21
490 FG	>3 ≤16	315	490 – 610	21
	>16 ≤40	315		21
	>40 ≤63	305		21
510 FG	>3 ≤16	355	510 – 650	21
	>16 ≤40	345		
	>40 ≤63	335		

NOTE
For thicknesses greater than 63 mm, the minimum values for yield stress may be reduced by 1% for each 5 mm increment in thickness over 63 mm. The minimum elongation values may also be reduced one unit, for all thicknesses over 63 mm. For thicknesses over 100 mm, the above values are to be agreed.

Table 3.4.5 Mechanical properties for acceptance purposes: alloy steels – Normalised and tempered

Grade of steel	Thickness mm (see Note)	Yield stress N/mm² minimum	Tensile strength N/mm²	Elongation on $5{,}65\sqrt{S_o}$ % minimum
13Cr Mo45	≤63	305	470–620	20
11Cr Mo910	≤16	275	480–630	18
	>16 ≤63	265		

NOTE
For thicknesses greater than 63 mm, the minimum values for yield stress may be reduced by 1% for each 5 mm increment in thickness over 63 mm. The minimum elongation values may also be reduced one unit, e.g. for all thicknesses over 63 mm. For thicknesses over 100 mm, the above values are to be agreed.

4.4.8 All test specimens are to be taken in the transverse direction unless otherwise agreed.

4.4.9 When material will be subject to strains in a through thickness direction, it is recommended that it should have specified through thickness properties in accordance with the requirements of Section 8.

4.5 Identification of materials

4.5.1 The particulars detailed in 1.10 are to be marked on all materials which have been accepted.

4.6 Certification of materials

4.6.1 At least two copies of each test certificate are to be provided. They are to be of the type and to give the information detailed in 1.11 and, additionally, are to state the specified maximum carbon equivalent. As a minimum, chemical composition is to include the content of any grain refining elements used and of the residual elements, as detailed in Table 3.4.1.

4.7 Mechanical properties for design purposes

4.7.1 Nominal values for the minimum lower yield or 0,2 per cent proof stress at temperatures of 50°C and higher are given in Tables 3.4.6 to 3.4.8.

4.7.2 These values are intended for design purposes only, and verification is not required except for materials complying with National or proprietary specifications where the elevated temperature properties used for design purposes are higher than given in Tables 3.4.6 to 3.4.8.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 3.4.6 Mechanical properties for design purposes (*see* 4.7.1) **: carbon and carbon-manganese steels – As-rolled**

Grade of steel	Thickness mm	Design temperature °C (*see* Note)						
		50	100	150	200	250	300	350
		Nominal minimum lower yield or 0,2% proof stress N/mm^2						
360 AR	≤ 40	154	153	152	145	128	108	102
410 AR	≤ 40	186	183	181	174	155	134	127
460 AR	≤ 40	218	213	210	203	182	161	153

NOTE
Maximum permissible design temperature is 350°C.

4.7.3 In such cases, at least one tensile test at the proposed design or other agreed temperature is to be made on material from each cast. Where materials of more than one thickness are supplied from one cast, the thickest material is to be tested. The test specimens are to be prepared from material adjacent to that used for tests at ambient temperature. The axis of the test specimens is to be between mid and quarter thickness of the material and the test specimens are to be machined to dimensions in accordance with the requirements of Chapter 2. The test procedure is also to be as detailed in Chapter 2, and the results are to comply with the requirements of the National or proprietary specifications.

4.7.4 As an alternative to 4.7.3, a manufacturer may carry out an agreed comprehensive test program for a stated grade of steel to demonstrate that the specified minimum mechanical properties at elevated temperatures can be consistently obtained. This test program is to be carried out under supervision of the Surveyors, and the results submitted for assessment and approval. When a manufacturer is approved on this basis, tensile tests at elevated temperatures are not required for acceptance purposes but, at the discretion of the Surveyors, occasional check tests of this type may be requested.

Section 5
Steels for machinery fabrications

5.1 General

5.1.1 Steel plates, sections or bars intended for use in the construction of major components of welded machinery structures, such as bedplates, crankcases, frames and entablatures, are to comply with one of the following alternatives:

(a) Any grade of normal strength structural steel as detailed in Section 2.

(b) Any grade of higher tensile structural steel as detailed in Section 3.

(c) Any grade of carbon-manganese boiler or pressure vessel steel as detailed in Section 4, except that for this application batch testing is acceptable. The size of a batch and the number of tensile tests are to be as detailed in Section 2.

5.1.2 The minus tolerances for products for machinery structures are to be in accordance with Table 3.5.1.

Table 3.5.1 Under thickness tolerances

Nominal thickness, t (mm)	Minus tolerance (mm)
$5 \leq t < 8$	–0,4
$8 \leq t < 15$	–0,5
$15 \leq t < 25$	–0,6
$25 \leq t < 40$	–0,8
$t \geq 40$	–1,0

5.2 Certification of materials

5.2.1 At least two copies of each test certificate are to be provided. They are to be of the type and give the information detailed in 1.11 and, additionally, are to state the specified maximum carbon equivalent. As a minimum, chemical composition is to include the contents of any grain refining elements used and of the residual elements.

Section 6
Ferritic steels for low temperature service

6.1 Scope

6.1.1 This Section gives specific requirements for carbon-manganese and nickel alloy steels intended for use in the construction of cargo tanks, storage tanks and process pressure vessels for liquefied gases.

6.1.2 The requirements of this Section are also applicable for other types of pressure vessels where the use of steels with guaranteed impact properties at low temperatures is required.

6.1.3 Provision is made for plates and sections up to 40 mm thick.

6.1.4 Steels with alternative chemical compositions or mechanical properties or in a different supply condition may be given special consideration.

6.2 Manufacture and chemical composition

6.2.1 All steels are to be in the killed and fine grain treated condition.

6.2.2 The chemical compositions of carbon-manganese steels are to comply with the appropriate requirements for Grades AH, DH, EH and FH strength levels 27S, 32, 36 and 40, *see* Table 3.3.2. For the uses defined in 6.1.1 and 6.1.2, however, these grades are to be designated LT–AH, LT–DH, LT–EH and LT–FH respectively.

6.2.3 The chemical compositions of nickel alloy steels are to comply with the appropriate requirements of Table 3.6.1.

6.2.4 For plate supplied from coil, the chemical analysis may be transposed from the certificate of the coil manufacture onto the re-processor's certificate.

6.3 Heat treatment

6.3.1 All materials are to be supplied in a condition complying with the requirements given in Table 3.6.2.

Table 3.6.2 Supply conditions

Grade	Plates	Sections and bars
LT – AH	N TM	Any
LT – DH		
LT – EH	Normalised (*see* Note) T.M.C.P.	
LT – FH	Quenched and tempered	N TM
1 1/2 Ni 3 1/2 Ni 5Ni	Normalised (*see* Note) Normalised and tempered Quenched and tempered	
9Ni	Double normalised and tempered Quenched and tempered	
NOTE Where the term 'Normalised' is used it does not include normalising rolling.		

6.4 Mechanical tests

6.4.1 For plates, a tensile test specimen is to be taken from one end of each piece when the mass does not exceed 5 tonnes and the length does not exceed 15 m. When either of these limits is exceeded, tensile test specimens are to be taken from both ends of each piece. A piece is to be regarded as the rolled product from a single slab or from a single ingot if this is rolled directly into plates.

6.4.2 For strips, tensile test specimens are to be taken from both ends of each coil.

6.4.3 Sections and bars are to be presented for acceptance test in batches containing not more than 50 lengths, as supplied. The material in each batch is to be of the same section size, from the same cast and in the same condition of supply. One tensile test specimen is to be taken from material representative of each batch, except that additional tests are to be taken when the mass of a batch exceeds 10 tonnes.

6.4.4 One set of three Charpy V-notch impact test specimens is to be taken for each tensile test specimen required.

Table 3.6.1 Chemical compositions of nickel alloy steels

Grade of steel	C	Si	Mn	Ni	P	S	Residual elements	Aluminium
1 1/2 Ni	0,18 max.	0,10 – 0,35	0,30 – 1,50	1,30 – 1,70	0,025 max.	0,020 max.	Cr 0,25 max. Cu 0,35 max. Mo 0,08 max. Total 0,60 max.	Total 0,020% min. Acid soluble 0,015% min.
3 1/2 Ni	0,15 max.		0,30 – 0,90	3,20 – 3,80				
5Ni	0,12 max.			4,70 – 5,30				
9Ni	0,10 max.			8,50 – 10,0				

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

6.4.5 For plates, these impact test specimens are to be cut with the principal axis perpendicular to the final direction of rolling. For sections, the impact test specimens are to be taken longitudinally.

6.4.6 The results of all tensile tests are to comply with the appropriate requirements given in Table 3.6.3. The ratio between the yield stress and the tensile strength is not to exceed 0,9 for normalised and TM steels and 0,94 for QT steels.

6.4.7 The average value for the three impact tests is to comply with the appropriate requirements given in Table 3.6.3. One individual value may be less than the required value provided that it is not less than 70 per cent of this average value. *See* Ch 2,1.4 for re-test procedures.

6.4.8 Where standard subsidiary impact specimens are necessary, *see* Ch 2,3.2.4.

6.4.9 Where plate is supplied from coil, both the tensile tests and the Charpy V-notch tests are to be taken from the de-coiled plate in accordance with the frequency specified for the Grade as required by this Section.

6.5 Identification of materials

6.5.1 The particulars detailed in 1.10 are to be marked on all materials which have been accepted.

6.6 Certification of materials

6.6.1 At least two copies of each test certificate are to be provided. They are to be of the type and give the information detailed in 1.11 together with general details of the heat treatment. As a minimum, chemical composition is to include the contents of any grain refining elements used and of the residual elements as detailed in Tables 3.3.2 or 3.6.1.

Table 3.6.3 Mechanical properties for acceptance purposes (*see* Note 1)

Grade of steel	Yield stress N/mm^2 min.	Tensile strength N/mm^2	Elongation on $5{,}65\sqrt{S_o}$ % min.	Charpy V-notch impact tests (*see* Note 3)	
				Test temp. °C	Impact energy
27S	265	400 – 530	22		
32	315	440 – 590	22		
LT – AH 36	355	490 – 620	21	0	
40	390	510 – 650	20		
27S	265	400 – 530	22		
32	315	440 – 590	22		
LT – DH 36	355	490 – 620	21	–20	Plates – transverse tests
40	390	510 – 650	20		
27S	265	400 – 530	22		Average energy 27 J min
32	315	440 – 590	22		
LT – EH 36	355	490 – 620	21	–40	
40	390	510 – 650	20		
27S	265	400 – 530	22		Sections and bars – longitudinal tests
32	315	440 – 590	22		
LT – FH 36	355	490 – 620	21	–60	
40	390	510 – 650	20		Average energy 41 J min
$1\frac{1}{2}$ Ni	275	490 – 640	22	–65	
$3\frac{1}{2}$ Ni	285	450 – 610	21	–95	
5Ni	390	540 – 740	21	–110	
9Ni	490	640 – 790	18	–196	

NOTES
1. These requirements are applicable to products not exceeding 40 mm in thickness. The requirements for thicker products are subject to agreement.
2. The minimum design temperatures at which plates of different thicknesses in the above grades may be used are given in Fig. 3.6.1 and Fig. 3.6.2. Consideration will be given to the use of thicknesses greater than those in the Tables or to the use of design temperatures below –165°C.
3. Impact tests are not required on thicknesses less than 6 mm.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Minimum design temperatures for carbon-manganese grades

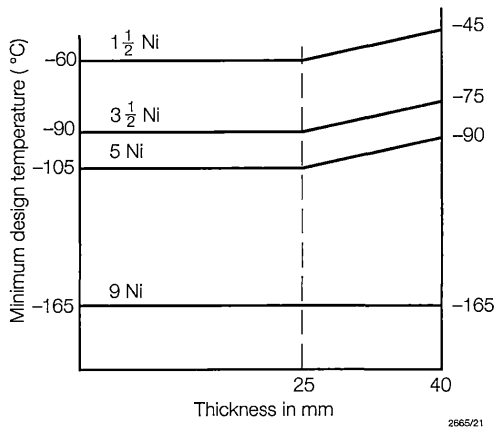

Fig. 3.6.2
Minimum design temperatures for nickel grades

Section 7
Austenitic and duplex stainless steels

7.1 Scope

7.1.1 Provision is made in this Section for rolled products in austenitic and duplex (austenite plus ferrite) stainless steels intended for use in the construction of cargo tanks, storage tanks and process pressure vessels for chemicals and liquefied gases.

7.1.2 Austenitic stainless steels are suitable for applications where the lowest design temperature is not lower than –165°C.

7.1.3 Austenitic stainless steels are also suitable for service at elevated temperatures, and for such applications the proposed specification should contain, in addition to the requirements of 7.1.6, minimum values for 0,2 and 1,0 per cent proof stresses at the design temperature.

7.1.4 Duplex stainless steels are suitable for applications where the lowest design temperature is above 0°C. Any requirement to use duplex stainless steels below 0°C will be subject to special consideration.

7.1.5 Duplex stainless steels are also suitable for service at temperatures up to 300°C, and for such applications the proposed specification should include, in addition to the requirements of 7.1.6, a minimum value for 0,2 per cent proof stress at the design temperature.

7.1.6 A specification giving details of the chemical composition, heat treatment and mechanical properties, including, for the austenitic grades, both the 0,2 and 1,0 per cent proof stresses, is to be submitted for consideration and approval.

7.2 Chemical composition

7.2.1 The chemical composition of ladle samples is to comply with the requirements given in Table 3.7.1.

7.2.2 Consideration will be given to the use of steels whose compositions are outside the scope of Table 3.7.1.

7.3 Heat treatment

7.3.1 All materials are to be supplied in the solution treated condition.

7.4 Mechanical tests

7.4.1 Tensile test specimens are to be taken in accordance with the appropriate requirements of 4.4 and 6.4.1.

7.4.2 For the duplex grades, one set of three Charpy V-notch impact test specimens machined from the longitudinal direction for each tensile test is to be tested at –20°C. The average energy value of the three specimens is to be not less than 41 Joules.

7.4.3 Unless otherwise agreed, impact tests are not required from the austenitic grades of steel given in this Section.

7.4.4 Where standard subsidiary Charpy V-notch test specimens are necessary, *see* Ch 2,3.2.4.

7.4.5 The results of all tensile tests are to comply with the requirements of Table 3.7.2 or the approved specification.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

7.5 Through thickness tests

7.5.1 Where material will be strained in a through thickness direction during welding or in service, through thickness tests are required on plates over 10 mm thick in all the grades of steels listed in Table 3.7.1, apart from Grades 304L, 304 LN, 321 and 347.

7.5.2 Testing is to conform with the requirements of Section 8, with the exception given in 7.5.3.

7.5.3 When the reduction in area is less than 35 per cent, metallographic or other evidence is required to show that no significant amount of any detrimental phase, such as sigma, is present.

7.6 Intergranular corrosion tests

7.6.1 For certain specific applications such as storage tanks for chemicals, it may be necessary to demonstrate that the material used is not susceptible to intergranular corrosion resulting from grain boundary precipitation of chromium-rich carbides.

7.6.2 When required, one test of this type is to be carried out for each tensile test. The material for the test is to be taken adjacent to that for the tensile test.

7.6.3 Unless otherwise agreed or required for a particular chemical cargo, the testing procedure is to be as given in 7.6.4, *see* Ch 2,8.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

7.6.4 Wherever practical, exposed cut edges should be avoided. However, where any such edges are to remain after fabrication is completed it is to be shown by an appropriate test that the corrosion resistance is adequate for the cargoes expected to be encountered.

7.7 Clad plates

7.7.1 Carbon or carbon-manganese steel plates, clad on one or both surfaces with a suitable grade of austenitic or duplex stainless steel, may be used for the construction of cargo or storage tanks for chemicals.

7.7.2 The carbon or carbon-manganese steel base plates are to comply with the requirements of Section 4, and the austenitic cladding material generally with the requirements of this Section.

7.7.3 The process of manufacture is to be specially approved and may be either by roll cladding or by explosive bonding.

7.7.4 Where the use of clad materials is proposed, the material specification is to be submitted for consideration, together with details of the extent, and the acceptance standards for non-destructive examination.

7.8 Identification of materials

7.8.1 The particulars detailed in 1.10 are to be marked on all materials which have been accepted.

7.9 Certification of materials

7.9.1 At least two copies of each test certificate are to be provided. They are to be of the type and give the information detailed in 1.11 and, where applicable, the results obtained from intercrystalline corrosion tests, and, additionally, are to state the specified maximum carbon equivalent. As a minimum, chemical composition is to include the contents of any grain refining elements used and of the residual elements, as detailed in Table 3.7.1.

■ *Section 8*
Plates with specified through thickness properties

8.1 Scope

8.1.1 Provision is made in this Section for 'Z' grade plate and wide flat material with improved ductility in the through thickness or 'Z' direction, *see* Fig. 3.8.1. The use of this material is recommended for certain types of welded structures (*see* 1.2) in order to minimise the possibility of lamellar tearing either during fabrication or erection.

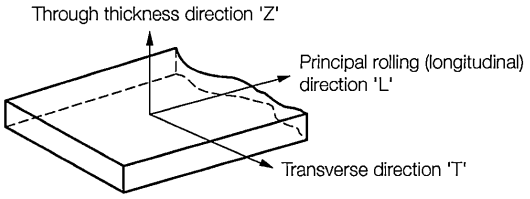

Fig. 3.8.1 Schematic of testing directions

8.1.2 Through thickness properties are characterised by specified values for reduction of area in a through thickness tensile test.

8.1.3 Provision is made for two grades Z25 and Z35. For normal ship applications the Z25 grade is applicable, whilst the Z35 grade is for more severe applications.

8.1.4 This 'Z' grade material is to comply with the requirements of Sections 2, 3, 4, 5 and 6 as appropriate, and the additional requirements of this Section.

8.1.5 The test procedure detailed in this Section may also be used to demonstrate that no unacceptable amount of banding of any detrimental phase, such as sigma is present, *see* 7.5.

8.2 Manufacture

8.2.1 All plates and wide flats are to be manufactured at works which have been approved by LR for this quality of material.

8.2.2 It is recommended that the steel should be efficiently vacuum de-gassed. The sulphur content is not to exceed 0,008 per cent.

8.2.3 Consideration will be given to proposals for alternative methods of improving through thickness properties.

8.3 Test material

8.3.1 Unless otherwise agreed, through thickness tensile tests are only required for plate materials where the thickness exceeds 15 mm for carbon and alloy steels or 10 mm in the case of austenitic and duplex stainless steels.

8.3.2 For plates and wide flats, one test sample is to be taken close to the longitudinal centreline from one end of each rolled piece representing the batch, *see* Table 3.8.1 and Fig. 3.8.2. The test sample must be large enough to accommodate the preparation of 6 specimens. 3 test specimens are to be prepared while the rest of the sample remains for possible retest.

8.3.3 The dimensions of the test specimens are to be in accordance with Ch 2,2.1.12.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 3.8.1 Batch size dependent on product and sulphur content

Product	$S > 0{,}005\%$	$S \leq 0{,}005\%$
Plates	Each piece (parent plate)	Maximum 50 t of products of the same cast, thickness and heat treatment
Wide flats of nominal thickness ≤ 25 mm	Maximum 10 t of products of the same cast, thickness and heat treatment	Maximum 50 t of products of the same cast, thickness and heat treatment
Wide flats of nominal thickness > 25 mm	Maximum 20 t of products of the same cast, thickness and heat treatment	Maximum 50 t of products of the same cast, thickness and heat treatment

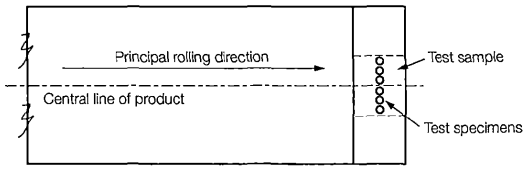

Fig. 3.8.2
Plate and wide flat sampling position

8.3.4 Alternatively, test sampling may be carried out in accordance with an accepted National or International Standard.

8.4 Mechanical tests

8.4.1 The three through thickness tensile test specimens are to be tested at ambient temperature and for acceptance are to give a minimum average reduction of area value of not less than that shown in Table 3.8.2. Only one individual value may be below the minimum average, but should not be less than the minimum individual value shown for the appropriate grade.

Table 3.8.2 Reduction of area acceptance values

Grade	Z25	Z35
Minimum average	25%	35%
Minimum individual	15%	25%

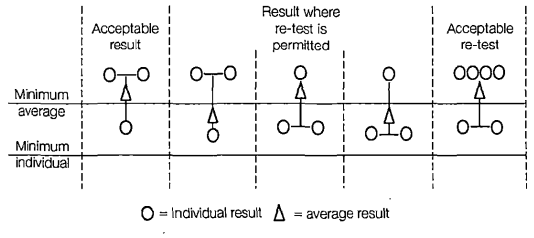

Fig. 3.8.3
Diagram showing acceptance/rejection and re-test criteria

8.4.2 If the average value fails to comply with 8.4.1, three additional tests may be made on specimens from the same test sample. The results of these tests are to be added to those previously obtained to form a new average, which for acceptance is to be not less than 25 per cent for grade Z25 or 35 per cent for grade Z35. No individual results in the re-test shall be below 25 per cent for grade Z25 or 35 per cent for grade Z35, *see* Fig. 3.8.3.

8.4.3 Where batch testing is permitted, and failure after re-test occurs, the tested piece is to be rejected. Each remaining piece in the batch may be individually tested and accepted based on satisfactory results.

8.4.4 If the fracture of a test specimen occurs in the weld or in the heat affected zone the test is to be regarded as invalid and is to be repeated on a new test specimen.

8.5 Non-destructive examination

8.5.1 All 'Z' grade plates are to be ultrasonically tested in the final supply condition with a probe frequency of 3-5 MHz. The testing is to be performed in accordance with and in compliance with either EN 10160 Level S1/E1 or ASTM A 578 Level C.

8.6 Identification of materials

8.6.1 Products which comply with the requirements of this Section are to have the notation Z25 or Z35 added to the steel grade designation.

8.7 Certification of materials

8.7.1 The following information is required to be included on the certificate in addition to the appropriate steel grade requirements:

(a) Through thickness reduction in area (%), individual results and average.

(b) Steel grade with Z25 or Z35 notation.

8.7.2 Steel grade requirements are to comply with Sections 1 to 7.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

■ *Section 9*
Bars for welded chain cables

9.1 Scope

9.1.1 Provision is made in this Section for rolled steel bars intended for the manufacture of three Grades (U1, U2 and U3) of stud link chain cable for the anchoring and mooring of ships and five Grades (R3, R3S, R4, R4S and R5) of offshore mooring cable.

9.1.2 For the ship grades, U1, U2 and U3, approval will permit the supply of bars of the appropriate grades and size to any chain cable manufacturer.

9.1.3 For the offshore grades, R3, R3S, R4, R4S and R5, approval is confined to bar to be supplied to a nominated chain manufacturer and will be given only after successful testing of a completed chain. Separate approvals are required if bar is to be supplied to more than one cable manufacturer. Approval of a higher grade does not cover approval of a lower grade, as all grades must be individually approved.

9.1.4 For all grades, approval is normally given for diameters of bars no greater than those of the bars used in procedure tests.

9.2 Manufacture

9.2.1 All grades of bar material are to be made from killed steel, and all grades of bar material except for Grade U1 chain cables are to be fine grained. For Grades R4S and R5 the austenite grain size is to be 6 or finer, in accordance with ASTM E112.

9.2.2 The bars are to be made to a specification approved by LR which should include the manufacturing procedure, deoxidation practice, heat treatment and mechanical properties.

9.2.3 The rolling reduction ratio of bars for Grades R3, R3S, R4, R4S and R5 must be at least 5:1.

9.3 Chemical composition

9.3.1 For Grades U1, U2 and U3 the chemical composition should be generally within the limits given in Table 3.9.1.

9.3.2 For Grades R3, R3S, R4, R4S and R5 the chemical composition is to comply with an approved specification, *see* 9.2.2.

9.3.3 For Grades R4, R4S and R5 chain cable the steel should contain a minimum of 0,2 per cent molybdenum. The reported composition is to include the contents of antimony, arsenic, tin, copper, nitrogen, aluminium and titanium.

9.3.4 For Grades R4S and R5 the steel used must be vacuum degassed.

9.4 Heat treatment

9.4.1 Unless stipulated otherwise, the bars are to be supplied in the as-rolled condition, but the supplier is to be advised by the chain manufacturer of the heat treatment to be used for the completed chain in order that the mechanical test specimens may be tested in the condition of heat treatment used for the chain.

9.4.2 For Grades U1 and U2, the samples selected from each batch may be tested either in the as-rolled condition, or after heat treatment where the chain is to be used in the heat treated condition, in full cross-section and in a manner simulating the heat treatment applied to the finished cable.

9.4.3 For Grades U3, R3, R3S, R4, R4S and R5 the sample is to be tested after heat treatment as detailed in 9.4.2.

9.5 Embrittlement tests

9.5.1 For Grades R3, R3S, R4, R4S and R5 the bar manufacturer is to provide evidence that the material is not susceptible to strain ageing or to temper brittleness under the conditions of manufacture of the chain. The results of the relevant tests are to be reported to LR at the approval stage. Approval will be restricted to the specified steel composition and if later this is altered then re-approval will be required. Temper brittleness testing may be waived if the chain is to be quenched after tempering.

Table 3.9.1 Chemical composition of killed steel bars

Grade	Chemical composition %												
	C max.	Si	Mn	P max.	S max.	Al	Nb max.	V max.	N max.	Cr max.	Cu max.	Ni max.	Mo max.
U1	0,20	0,15–0,35	0,40 min.	0,04	0,04	–	–	–	–	–	–	–	–
U2	0,24	0,15–0,55	1,60 max.	0,035	0,035	0,02 min. *see* Note 1	–	–	–	–	–	–	–
U3	0,33	0,15–0,35	1,90 max.	0,04	0,04	0,065 max. *see* Note 2	0,05 *see* Note 2	0,10 *see* Note 2	0,015	0,25	0,35	0,40	0,08

NOTES
1. Aluminium may be partly replaced by other grain refining elements.
2. To obtain fine grain steel, at least one of these grain refining elements must be present in sufficient amount.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

9.5.2 Each heat of steel bars of grades R3S, R4, R4S and R5 is to be tested for hydrogen embrittlement (*see* Ch 2,5.3). In the case of continuous casting, test samples representing both the beginning and the end of the charge are to be taken. In the case of ingot casting, test samples representing two different ingots are to be taken.

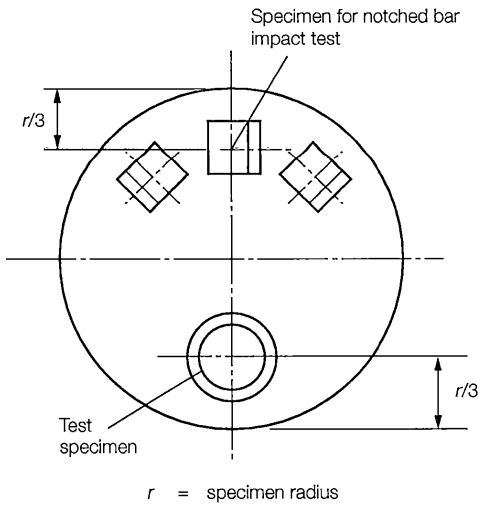
9.5.3 Each sample is to be heat treated in a manner simulating the heat treatment of the finished chain. From each sample two specimens are to be prepared from the mid-diameter of the bar and tested in accordance with Ch 2,5.3.

9.5.4 The ratio Z_1/Z_2 is to be greater than or equal to 0,85, where Z_1 is the reduction in area without baking and Z_2 the reduction in area after baking.

9.5.5 If the requirement is not met, the material is to be subjected to a hydrogen degassing treatment which is subject to approval by LR. Further tests are to be performed after degassing.

9.6 Mechanical tests

9.6.1 Bars of the same nominal diameter are to be presented for test in batches of 50 tonnes or fraction thereof from the same cast. A suitable length from one bar in each batch is to be selected for test purposes. Test pieces are to be taken from the positions as shown in Fig. 3.9.1.



r = specimen radius

Fig. 3.9.1 Sampling of steel bars

9.6.2 For all grades, one tensile test is to be taken from each sample length selected. Additionally, for Grades U3, R3, R3S, R4, R4S and R5 material, one set of three Charpy V-notch impact test specimens is to be prepared. Impact tests are also required for Grade U2 when the chain is to be supplied in as-welded condition.

9.6.3 The results of all tensile and, where applicable, impact tests are to be in accordance with the appropriate requirements of Table 3.9.2.

9.6.4 Failure to meet the requirements will result in the rejection of a batch of material, unless it is clearly attributed to improper simulated heat treatment. This is to be confirmed to be to the satisfaction of LR, and further heat treatment and testing will be required prior to acceptance.

9.7 Structure and hardenability tests

9.7.1 For Grades R4S and R5, the following tests are to be carried out on each heat:

(a) Assessment and quantification of the level of non-metallic micro inclusion. These must be acceptable for the final product.

(b) Macro etching on a representative sample, in accordance with ASTM E381 or equivalent. This must be free from any injurious segregation or porosity.

(c) Jominy hardenability tests in accordance with ASTM A255 or equivalent.

9.8 Dimensional tolerances

9.8.1 The tolerances on diameter and ovality of the bar are to be in accordance with Table 3.9.3.

9.9 Non-destructive examination

9.9.1 For the R3, R3S, R4, R4S and R5 grades all bars are to be inspected by a magnetic particle or eddy current method and are also to be subjected to ultrasonic examination.

9.9.2 All non-destructive examination is to be carried out in accordance with approved procedures, in accordance with Ch 1,5.

9.9.3 All non-destructive examination operators are to be qualified in the method of non-destructive examination to a minimum of Level II in accordance with a recognised standard.

9.9.4 The bars are to be free from pipes, cracks, flakes, and injurious surface defects such as seams, laps, and rolled-in mill scale. Longitudinal discontinuities may be removed by blending to a smooth contour provided that their depth is not greater than 1 per cent of the bar diameter, and that the required diameter tolerances are not compromised. The contour radiuses are to be a minimum of four times the excavation depth.

9.9.5 The frequency of non-destructive testing may be reduced at the discretion of LR, provided statistical evidence is available that the required quality is achieved consistently.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 3.9.2 Mechanical properties

Grade	Yield stress N/mm² minimum	Tensile strength N/mm²	Elongation on 5,65 $\sqrt{S_o}$ % minimum	Reduction of area % minimum	Charpy V-notch impact tests		
					Test temperature °C	Average energy J minimum	Average energy flash weld J minimum
U1	–	370–490	25	—	—	—	—
U2	295	490–690	22	—	0 (*see* Note 1)	27	—
U3	410	690 minimum	17	40	0 –20 (*see* Note 2)	60 35	— —
R3	410 (*see* Note 3)	690 minimum (*see* Note 3)	17	50	0 –20 (*see* Note 2)	60 40	50 30
R3S	490 (*see* Note 3)	770 minimum (*see* Note 3)	15	50	0 –20 (*see* Note 2)	65 45	53 33
R4	580 (*see* Note 3)	860 minimum (*see* Note 3)	12	50	–20	50	36
Grade R4S (*see* Note 4)	700 (*see* Note 3)	960 minimum (*see* Note 3)	12	50	–20	56	40
Grade R5 (*see* Note 4)	760 (*see* Note 3)	1000 minimum (*see* Note 3)	12	50	–20	58	42

NOTES
1. Impact tests may be waived when the chain cable is to be supplied in one of the heat treated conditions given in Table 10.2.3.
2. Testing may be carried out at either 0°C or –20°C, at the option of LR.
3. The ratio of yield strength to tensile strength should not exceed 0,92.
4. The maximum hardness for R4S is to be HB330, and for R5 is to be HB340.

Table 3.9.3 Dimensional tolerance of bar stock

Nominal diameter mm	Tolerance on diameter mm	Tolerance on roundness ($d_{max} - d_{min}$) mm
≤20	–0/+5,0	0,60
>20 ≤25	–0/+1,0	0,60
>26 ≤35	–0/+1,2	0,80
>36 ≤50	–0/+1,6	1,10
>51 ≤80	–0/+2,0	1,50
>81 ≤100	–0/+2,6	1,95
>101 ≤120	–0/+3,0	2,25
>121 ≤160	–0/+4,0	3,00
>161 ≤210	–0/+5,0	4,00

9.10 Identification

9.10.1 Each bar is to be identified in accordance with 1.10 and, in addition, is to be marked with the appropriate grade of chain cable.

9.11 Certification of materials

9.11.1 Each consignment of bars is to be accompanied by a certificate of a type and in accordance with 1.11 but with the addition of the grade of chain cable, the rolling reduction ratio, the results of the micro inclusion, macro etch and hardenability tests, where required by each grade.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

■ *Section 10*
High strength quenched and tempered steels for welded structures

10.1 Scope

10.1.1 Provision is made in this Section for weldable high strength quenched and tempered steel plates and wide flats up to 70 mm thick. However, special consideration will be given to thicknesses up to 50 mm supplied in the TM rolled condition.

10.1.2 Plates and wide flats exceeding 70 mm in thickness as well as other product forms may also be supplied in accordance with the requirements of this Section provided that the prior agreement of LR is obtained.

10.1.3 The steels may be supplied in six strength levels with minimum yield stresses of 420, 460, 500, 550, 620 and 690 N/mm^2 respectively.

10.1.4 Each strength level is sub-divided into four grades AH, DH, EH and FH, differing essentially in the required levels of notch toughness.

10.1.5 For the designation to fully identify a steel and its properties, the appropriate grade letter should precede the strength level number, e.g. EH 42.

10.1.6 Steels differing in strength level, mechanical properties and chemical composition from those detailed in this Section may be supplied, subject to special approval from LR. Such steels are to have the letter 'S' after the agreed identification mark.

10.2 Manufacture and chemical composition

10.2.1 The steels are to be fully killed and fine grain treated.

10.2.2 The chemical composition is to comply with the requirements of the approved manufacturing specification and the limits set in Table 3.10.1.

10.2.3 The cold cracking susceptibility, P_{cm}, may be used as an alternative to the carbon equivalent for evaluating weldability. It is to be calculated from the ladle analysis using the following formula:

$$P_{cm} = C + \frac{Si}{30} + \frac{Mn + Cr + Cu}{20} + \frac{Ni}{60} + \frac{Mo}{15} + \frac{V}{10} + 5B$$

The maximum allowable P_{cm} is to be agreed with LR and is to be included in the approved manufacturing specification.

10.3 Mechanical properties

10.3.1 At least one tensile test piece and one set of three Charpy V-notch impact tests specimens are to be taken from each piece as heat treated.

Table 3.10.1 Chemical composition

Grade	AH	DH	EH	FH
Carbon % max	0,21	0,20		0,18
Manganese % max	1,70	1,70		1,60
Silicon % max	0,55	0,55		0,55
Phosphorus % max	0,035	0,030		0,025
Sulphur % max	0,035	0,030		0,025
Nitrogen % max	0,020	0,020		0,020
Grain refining elements (*see* Note 1)				
Aluminium (acid soluble) % min (*see* Note 2)	0,015			
Niobium %	0,02—0,05			
Vanadium %	0,03—0,10			
Titanium % max	0,02			
Total (Nb + V + Ti) % max	0,12			

NOTES
1. The steel is to contain aluminium, niobium, vanadium or other suitable grain refining elements, either singly or in any combination. When used singly, the content is to be within the limits given in the Table. When used in combination, these limits are not applicable but the proportions of the grain refining elements are to be in accordance with the approved manufacturing specification.
2. The total aluminium content may be determined instead of the acid soluble content. In such cases the total aluminium content is not to be less than 0,020%.
3. Alloying elements and residual elements other than those listed in the Table (e.g. Ni, Cr, Cu, Mo and B) are to be included in the approved manufacturing specification.

10.3.2 For continuously heat treated products, one tensile test piece and a set of three impact test specimens are to be taken from each plate as heat treated.

10.3.3 For plates and wide flats with widths exceeding 600 mm, the tensile and impact test specimens are to be taken with their axes transverse to the final direction of rolling. For other products, the impact test specimens are to be taken in the longitudinal direction but the tensile test specimens may be taken in either the longitudinal or transverse direction as agreed with LR.

10.3.4 The results of all tests are to comply with the appropriate requirements of Table 3.10.2.

10.3.5 Where standard subsidiary impact test specimens are necessary, *see* Ch 2,3.2.4.

10.4 Identification of materials

10.4.1 The particulars detailed in 1.10 are to be marked on each piece which has been accepted and, for ease of recognition, are to be encircled or otherwise marked with paint.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 3.10.2 Mechanical properties for acceptance purposes

Grade	Yield stress N/mm² min. (*see* Note 1)	Tensile strength N/mm²	Elongation on $5{,}65\sqrt{S_o}$ % minimum (*see* Note 2)		Charpy V-notch impact tests (*see* Note 4)		
					Test temperature	Average energy J minimum	
			Transverse	Longitudinal	°C	Transverse	Longitudinal
AH 42 DH 42 EH 42 FH 42	420	530 – 680	18	20	0 –20 –40 –60	28	42
AH 46 DH 46 EH 46 FH 46	460	570 – 720	17	19	0 –20 –40 –60	31	46
AH 50 DH 50 EH 50 FH 50	500	610 – 770	16	18	0 –20 –40 –60	33	50
AH 55 DH 55 EH 55 FH 55	550	670 – 830	16	18	0 –20 –40 –60	37	55
AH 62 DH 62 EH 62 FH 62	620	720 – 890	15	17	0 –20 –40 –60	41	62
AH 69 DH 69 EH 69 FH 69	690	770 – 940	14	16	0 –20 –40 –60	46	69

NOTES

1. Where a distinct yield stress indication is not obtainable during tensile testing the 0,2% proof stress is applicable.
2. For full thickness tensile test specimens with a width of 25 mm and a gauge length of 200 mm (*see* Fig. 2.2.4 in Chapter 2) the minimum elongation is to be:

Thickness mm		≤10	>10 ≤15	>15 ≤20	>20 ≤25	>25 ≤40	>40 ≤50	>50 ≤70
Strength levels								
Elongation %	42	11	13	14	15	16	17	18
	46	11	12	13	14	15	16	17
	50 and 55	10	11	12	13	14	16	16
	62	9	11	12	12	13	14	15
	69	9	10	11	11	12	13	14

These values apply to transverse specimens. Where the use of longitudinal specimens has been agreed, the values are to be increased by 2%.

3. The ratio of yield strength to tensile strength should not exceed 0,94.
4. Impact tests are not required on thicknesses less than 6 mm.

10.5 Certification of materials

10.5.1 At least two copies of each test certificate are to be provided. They are to be of the type and give the information detailed in 1.11 and, additionally, are to state the specified maximum carbon equivalent. As a minimum, chemical composition is to include the contents of any grain refining elements used and of the residual elements as detailed in Table 3.10.1.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Steel Castings

Chapter 4

Section 1

Section

1 **General requirements**

2 **Castings for ship and other structural applications**

3 **Castings for machinery construction**

4 **Castings for crankshafts**

5 **Castings for propellers**

6 **Castings for boilers, pressure vessels and piping systems**

7 **Ferritic steel castings for low temperature service**

8 **Stainless steel castings**

9 **Steel castings for container corner fittings**

■ *Section 1*
General requirements

1.1 Scope

1.1.1 This Section gives the general requirements for steel castings intended for use in the construction of ships, other marine structures, machinery, boilers, pressure vessels and piping systems.

1.1.2 Where required by the relevant Rules dealing with design and construction, castings are to be manufactured and tested in accordance with Chapters 1 and 2, together with the general requirements given in this Section and the appropriate specific requirements given in Sections 2 to 9.

1.1.3 As an alternative to 1.1.2, castings which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Chapter or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of Chapter 1.

1.1.4 Where small castings are produced in large quantities, or where castings of the same type are produced in regular quantities, alternative survey procedures, in accordance with Ch 1,2.4 may be adopted.

1.2 Manufacture

1.2.1 Castings are to be made at foundries approved by LR. The steel used is to be manufactured by a process approved by Lloyd's Register (hereinafter referred to as 'LR').

1.2.2 All flame cutting, scarfing or arc-air gouging to remove surplus metal is to be undertaken in accordance with recognised good practice and is to be carried out before the final heat treatment. Preheating is to be employed where necessitated by the chemical composition and/or thickness of the casting. The affected areas are to be either machined or ground smooth for a depth of about 2 mm unless it has been shown that the material has not been damaged by the cutting process. Special examination will be required to find any cracking in way of the cut surfaces.

1.2.3 Where two or more castings are joined by welding to form a composite item, details of the proposed welding procedure are to be submitted for approval. Welding approval procedure tests will be required, *see also* the requirements of 1.9.

1.3 Quality of castings

1.3.1 All castings are to be free from surface or internal defects which would be prejudicial to their proper application in service. The surface finish is to be in accordance with good practice and any specific requirements of the approved specification.

1.3.2 The surfaces are not to be hammered, peened or treated in any way which may obscure defects.

1.3.3 The locations of all chaplets are to be noted and to be subject to close visual inspection (and when necessary ultrasonic examination) to ensure complete fusion.

1.4 Chemical composition

1.4.1 All castings are to be made from killed steel. The chemical composition of the ladle sample is to be within the limits given in the relevant Section of this Chapter. Where general overall limits are specified, the chemical composition is to be appropriate for the type of steel, dimensions and required mechanical properties of the castings.

1.4.2 Except where otherwise specified, suitable grain refining elements may be used at the discretion of the manufacturer. The content of such elements is to be reported in the ladle analysis.

1.5 Heat treatment

1.5.1 All castings are to be heat treated in accordance with the requirements given in the relevant Section of this Chapter.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.5.2 Heat treatment is to be carried out in a properly constructed furnace which is efficiently maintained and has adequate means of temperature control and is fitted with pyrometers which measure and record the temperature of the furnace charge. The furnace dimensions are to be such as to allow the whole furnace charge to be uniformly heated to the necessary temperature. Sufficient thermocouples are to be connected to the furnace charge to show that its temperature is adequately uniform and the temperatures are to be recorded throughout the heat treatment. Alternative procedures are to be approved by LR, Materials and NDE department. Copies of these records are to be presented to the Surveyor together with a sketch showing the positions at which the temperature measurements were carried out. The records are to identify the furnace that was used and give details of the charge, the heat treatment temperature and time at temperature and the date. The Surveyor is to examine the charts and confirm the details on the certificate. In the case of very large components which require heat treatment, alternative methods will be specially considered.

1.5.3 If a casting is locally reheated, or any straightening operation is performed after the final heat treatment, a subsequent stress relieving heat treatment may be required in order to avoid the possibility of harmful residual stresses.

1.6 Test material and test specimens

1.6.1 Test material sufficient for the tests specified in Sections 2 to 9 and for possible re-test purposes is to be provided for each casting. The test samples are to be either integrally cast or gated to the casting and are to have a thickness of not less than 30 mm.

1.6.2 The test samples are not to be detached from the casting until the heat treatment specified in 1.5.1 has been completed and they have been properly identified.

1.6.3 As an alternative to 1.6.1 and 1.6.2, where a number of small castings of about the same size, each of which is under 1000 kg in mass, are made from one cast and heat treated in the same furnace charge, a batch testing procedure may be adopted, using separately cast test samples of suitable dimensions. The test samples are to be properly identified and heat treated together with the castings which they represent. At least one test sample is to be provided for each batch of castings.

1.6.4 The test specimens are to be prepared in accordance with the requirements of Chapter 2. Tensile test specimens are to have a cross-sectional area of not less than 150 mm^2.

1.6.5 Re-test procedures are to be in accordance with Ch 2,1.4.

1.7 Visual and non-destructive examination

1.7.1 This Section gives the general requirements for non-destructive examination of steel castings. As an alternative, castings may be examined in accordance with a National Specification, provided it gives reasonable equivalence to these Rules.

1.7.2 All castings are to be cleaned and adequately prepared for inspection. Suitable methods include pickling, caustic cleaning, wire brushing, local grinding, shot or sand blasting.

1.7.3 The surfaces are not to be hammered, peened or treated in any way which may obscure defects.

1.7.4 Unless otherwise agreed, the accuracy and verification of dimensions are the responsibility of the manufacturer.

1.7.5 All castings are to be presented to the Surveyor for visual examination. Where applicable, this is to include the examination of internal surfaces. Castings are to be subject to magnetic particle examination or dye penetrant inspection (for austenitic stainless steel castings, *see* Section 8) in accordance with 1.7.9, unless more specific requirements for non-destrutive examination are included in subsequent Sections of this Chapter, other parts of the Rules or the agreed specification.

1.7.6 Where specified or required by the Rules non-destructive examination is to be carried out before acceptance. All tests are to be in accordance with the requirements of Ch 1,5.

1.7.7 The manufacturer is to provide the Surveyor with a signed report confirming that non-destructive examination has been carried out and that such inspection has not revealed any significant defects.

1.7.8 Where magnetic particle examination is specified or required, this is to be carried out using a suspension of magnetic particles in a suitable fluid. The dry powder method is not acceptable for the final inspection. Prods are not permitted on finished machined surfaces.

1.7.9 Where required, magnetic particle or dye penetrant testing is to be carried out by the manufacturer whenever appropriate and also when the castings are in the finished condition. The tests are to be made in the presence of the Surveyor unless otherwise specially agreed. The castings are to be examined in the following areas:

(a) At all accessible fillets and changes of section.
(b) At positions where surplus metal has been removed by flame cutting, scarfing or arc-air gouging.
(c) In way of fabrication weld preparations, for a distance not less than 50 mm form the edge.
(d) In way of welds.
(e) In way of chaplets.
(f) At other positions agreed with the Surveyor to include areas which may be subjected to high stress in service.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.7.10 Where required by subsequent Sections or by the agreed specification, ultrasonic examination is to be carried out by the manufacturer, but Surveyors may request to be present in order to verify that the examination is carried out in accordance with the agreed procedure. This examination is to be carried out in the following areas:

(a) At positions which may be subjected to high stresses in service, as agreed with the Surveyor.
(b) In way of fabrication weld preparations, for a distance not less than 50 mm form the edge.
(c) At positions where subsequent machining may expose filamentary shrinkage or other defects (e.g. bolt holes, bearing bores).
(d) In way of welding.
(e) In way of riser positions.
(f) At positions where experience shows that significant internal defects may occur: these are to be agreed between the manufacturer and the Surveyor.

1.7.11 Radiographic examination, where required, is to be carried out by the manufacturer in areas generally as indicated for ultrasonic examination in 1.7.10. All radiographs are to be submitted to the Surveyor for examination and acceptance. The radiographic technique and acceptance standards are to be to the satisfaction of the Surveyor and in accordance with any requirements of the approved specification.

1.7.12 In the event of any casting proving to be defective during subsequent machining or testing it is to be rejected notwithstanding any previous certification.

1.7.13 The general acceptance criteria given in 2.5.2 are to be applied where no specific acceptance criteria are stated in the subsequent Sections of this Chapter.

1.8 Pressure testing

1.8.1 Where required by the relevant Rules, castings are to be pressure tested in the final machined condition before final acceptance. These tests are to be carried out in the presence of the Surveyors and are to be to their satisfaction.

1.9 Rectification and dressing of castings

1.9.1 When unacceptable defects are found in a casting, these are to be removed by machining or chipping. Flame-scarfing or arc-air gouging may also be used provided that preheating is employed when necessary and that the surfaces of the resulting excavation are subsequently ground smooth. Complete elimination of the defective material is to be proven by adequate non-destructive examination. Shallow grooves or excavations resulting from the removal of defects may, at the discretion of the Surveyor, be accepted provided that they will cause no appreciable reduction in the strength of the castings and that they are suitably blended by grinding. Complete elimination of the defective material is to be verified by magnetic particle or dye penetrant testing.

1.9.2 Where flame scarfing or arc-air gouging is used, the requirements detailed in 1.2.2 are to apply.

1.9.3 Grinding wheels for use on austenitic stainless steels are to be of an iron-free type and shall have been used only on stainless steels.

1.9.4 All proposals to repair a defective casting by welding are to be submitted to the Surveyor before this work is commenced. The Surveyor is to satisfy himself that the number, position and size of the defects are such that the casting can be effectively repaired.

1.9.5 A statement and/or sketch detailing the extent and position of all welds is to be prepared by the manufacturer. Copies of these sketches are to be submitted to LR, and copies are to be attached to the certificates for the castings.

1.9.6 All welding is to be carried out by an approved welder and in accordance with an approved welding procedure which includes the features referred to in 1.9.6 to 1.9.13.

1.9.7 Where welding is required, a grain refining heat treatment is to be given to the whole casting prior to carrying out welding unless agreed otherwise with the Surveyor. Grain refining heat treatment requires heating above the upper critical temperature.

1.9.8 Any excavations are to be of suitable shape to allow good access for welding and, after final preparation for welding, are to be re-examined by suitable non-destructive testing methods to ensure that all defective material has been eliminated.

1.9.9 All castings in alloy steels other than austenitic and duplex stainless steels are to be suitably preheated prior to welding. Castings in carbon-manganese steels may also be required to be preheated, depending on their chemical composition, the dimensions, configuration and positions of the welds.

1.9.10 Welding is to be carried out under cover, in positions free from draughts and adverse weather conditions. As far as possible, all welding is to be carried out in the downhand (flat) position.

1.9.11 The welding consumables used are to be of an appropriate composition, giving a weld deposit with mechanical properties similar and in no way inferior to those of the parent castings. The use of low hydrogen type welding consumables is preferred. Welding procedure tests are to be carried out by the manufacturer to demonstrate that satisfactory mechanical properties can be obtained after heat treatment as detailed in 1.9.12, and the results of these tests are to be presented to the Surveyor.

1.9.12 After welding is completed, the castings are to be given the heat treatment specified in Sections 2 to 9, or a stress relieving heat treatment at a temperature of not less than 550°C. The type of heat treatment required will be dependent on the chemical composition of the casting and the dimensions, positions and nature of the repairs.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.9.13 Special consideration may be given to a local stress relieving heat treatment where both the welded area is small and machining of the casting has reached an advanced stage but prior agreement is to be obtained from LR in writing. The welding procedure is to be such that residual stresses are minimised.

1.9.14 On completion of heat treatment, all welds and adjacent material are to be ground smooth and examined by magnetic particle, or liquid penetrant testing, ultrasonic or radiographic examination. The Surveyor is to attend at these inspections, to witness the results of magnetic particle or liquid penetrant examination and to examine any radiographs. Satisfactory results are to be obtained from all forms of non-destructive examination used.The acceptance criteria for the NDE of welds are to be in accordance with subsequent Sections of this Chapter or where these do not exist, Tables 13.2.4 to 13.2.6 in Chapter 13, as appropriate.

1.9.15 Where no welding has been made on a casting, the manufacturer is to provide the Surveyor with a written statement that this is the case.

1.9.16 The foundry is to maintain full records detailing the weld procedure, heat treatment and the extent and location of all welds made to each casting. These records are to be available for review by the Surveyor, and copies of individual records are to be supplied to the Surveyor on request.

1.9.17 For rectification of defective steel castings for crankshafts, *see* 4.7.

1.10 Identification of castings

1.10.1 The manufacturer is to adopt a system of identification, which will enable all finished castings to be traced to the original cast, and the Surveyor is to be given full facilities to trace the castings when required.

1.10.2 Before acceptance, all castings which have been tested and inspected with satisfactory results are to be clearly marked by the manufacturer with the following particulars:

(a) Identification number, cast number or other marking which will enable the full history of the casting to be traced.
(b) Manufacturer's name or trade mark.
(c) LR or Lloyd's Register and the abbreviated name of LR's local office.
(d) Personal stamp of Surveyor responsible for inspection.
(e) Test pressure, where applicable.
(f) Date of final inspection.

1.10.3 Where small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with the Surveyor.

1.11 Certification of materials

1.11.1 A LR certificate is to be issued, *see* Ch 1,3.1.

1.11.2 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each casting or batch of castings which has been accepted:

(a) Purchaser's name and order number.
(b) Description of castings and steel grade.
(c) Identification number.
(d) Steel making process, cast number, chemical analysis of ladle samples and, in the case of the Special grade (*see* Section 2), the chemical analysis of the product or test bar.
(e) General details of heat treatment including the temperature and time at temperature.
(f) Results of mechanical tests.
(g) Test pressure, where applicable.

1.11.3 Where applicable, the manufacturer is to provide a signed report regarding non-destructive examination as required by 1.7.7 together with a statement and/or sketch detailing the extent and position of all weld repairs made to each casting as required by 1.9.5 or the statement detailed in 1.9.15.

■ *Section 2*
Castings for ship and other structural applications

2.1 Scope

2.1.1 The requirements for carbon-manganese steel castings, intended for ship and other structural applications where the design and acceptance tests are related to mechanical properties at ambient temperature, are given in this Section.

2.1.2 Provision is made for two quality grades, Normal and Special.

2.1.3 Where it is proposed to use carbon-manganese steels of higher specified minimum tensile strength than required by 2.4.3, or alloy steels, particulars of the chemical composition, mechanical properties and heat treatment are to be submitted for approval.

2.2 Chemical composition

2.2.1 The chemical composition of ladle samples is to comply with Table 4.2.1.

2.2.2 For the Special grade, the product of the aluminium and nitrogen contents is to comply with the following formula:

$$(\%\ Al_{acid\ sol} \times \%\ N)\ 10^5 \leq 60$$

2.2.3 For the Special grade, a check chemical analysis on the product or a test bar is mandatory. The check analysis on the product or test bar is to comply with the requirements of Table 4.2.1.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 4.2.1 Chemical composition

Quality grade	Normal	Special (*see* Note 3)

Total	0,80% max.	0,80% max.

NOTES
1. The total aluminium content may be determined instead of the acid soluble content, in which case the total aluminium content is to be 0,020–0,10%.
2. Grain refining elements other than aluminium may be used subject to special agreement with LR.
3. For the Special grade, the nitrogen content is to be determined.

2.3 Heat treatment

2.3.1 Castings are to be supplied:
(a) fully annealed; or
(b) normalised; or
(c) normalised and tempered at a temperature of not less than 550°C; or
(d) quenched and tempered at a temperature of not less than 550°C.

2.3.2 For larger castings where a coarse of microstructure may be present in heavier thickness, a double austenising heat treatment may be required to ensure adequate grain refinement. A coarse microstructure will be indicated by an increased attenuation of approxiamtely 30 dB/m at 2 MHz during ultrasonic examination.

2.3.3 Following weld repair and or the attachment of handling brackets, all castings are to be subject to post weld heat treatment at a temperature of not less than 550°C before delivery.

2.4 Mechanical tests

2.4.1 At least one tensile test is to be made on material representing each casting or batch of castings.

2.4.2 Where the casting is of complex design, or where the finished mass exceeds 10 tonnes, two test samples are to be provided. Where large castings are made from two or more casts which are not mixed in a ladle prior to pouring, two or more test samples are required corresponding to the number of casts involved. These are to be integrally cast at locations as widely separated as possible.

2.4.3 The results of these tests are to comply with the following requirements:

Yield stress	200 N/mm^2 min.
Tensile strength	400 N/mm^2 min.
Elongation on $5{,}65\sqrt{S_o}$	25% min.
Reduction of area	40% min.

2.4.4 A set of three Charpy V-notch impact test specimens is to be provided with each casting in the Special grade. These may be taken from a small extension of the thickest part of the casting or from a block cast integrally with the casting and having dimensions representative of the largest section thickness of the casting. These are to be tested in accordance with Chapter 2 and are to have an average energy of not less than 27J at 0°C.

2.5 Non-destructive examination

2.5.1 Castings used in ship construction for the sternframe, rudder and propeller shaft supports are to be examined by ultrasonic and magnetic particle methods in accordance with 1.7. The type and extent of non-destructive examination of castings for other structural applications are to be specially agreed by the Surveyor.

2.5.2 The extent and methods of non-destructive examination to be applied to typical hull steel castings are shown in Figs. 4.2.1 to 4.2.6 in addition to the areas specified in 1.7.9 and 1.7.10.

2.5.3 Acceptance levels for Visual Inspection are to be taken as follows:
(a) No cracks or hot tears are permitted.
(b) Castings are to be free of other injurious indications to the satisfaction of the Surveyor.
(c) Additional magnetic particle, dye penetrant or ultrasonic testing may be required for a more detailed evaluation of surface irregularities at the request of the Surveyor. These examinations are in addition to those required by 2.6.

2.6 Acceptance levels for surface crack detection

2.6.1 The following definitions apply to indications associated with magnetic particle and dye penetrant inspection:

(a) **Linear indication.** An indication in which the length is at least three times the width.

(b) **Non-linear indication.** An indication of circular or elliptical shape with a length less than three times the width.

(c) **Aligned indication.** Three or more indications in a line, separated by 2 mm or less edge-to-edge.

(d) **Open indication.** An indication visible after removal of the magnetic particles or that can be detected by the use of contrast dye penetrant.

(e) **Non-open indication.** An indication that is not visually detectable after removal of the magnetic particles or that cannot be detected by the use of contrast dye penetrant.

(f) **Relevant indication.** An indication that is caused by a condition or type of discontinuity that requires evaluation. Only indications which have any dimension greater than 1,5 mm are to be considered relevant.

2.6.2 For the purpose of evaluating indications, the surface is to be divided into reference band length of 150 mm for level MT1/PT1 and into reference areas of 225 cm^2 for level MT2/PT2. The band length and/or area is to be taken in the most unfavourable location relative to the indications being evaluated.

2.6.3 The following quality levels recommended for magnetic particle testing (MT) and/or dye penetrant testing (PT) are;

(a) Level MT1/PT1 – fabrication weld preparation areas.

(b) Level MT2/PT2 – other locations indicated on Figs. 4.2.1 to 4.2.6.

The acceptance criteria are shown in Table 4.2.2. Cracks and hot tears are not acceptable.

2.6.4 Acceptance criteria for ultrasonic testing are shown in Table 4.2.3 as UT1 and UT2. Discontinuities within the examined zones interpreted to be cracks or hot tears are not acceptable.

2.6.5 Level UT1 is applicable to the following:

(a) Fabrication weld preparations for a distance of 50 mm.

(b) 50 mm depth from the final machined surface including boltholes.

(c) Fillet radii to a depth of 50 mm and within a distance of 50 mm from the radius end.

(d) Castings subject to cyclic bending stresses, e.g. rudder horn, rudder castings and rudder stocks, the outer one third of thickness in the zones shown in Figs. 4.2.1 to 4.2.6

2.6.6 Level UT2 is applicable to the following:

(a) For locations which are not specified in 2.6.5, nominated for ultrasonic testing in Figs. 4.2.1 to 4.2.6 or on the inspection plan.

(b) Positions outside locations nominated for level UT1 examination where feeders and gates have been removed.

(c) Castings subject to cyclic bending stresses, at the central one third of thickness in the zones shown in Figs. 4.2.1 to 4.2.6.

Table 4.2.2 Acceptance criteria for surface inspection evaluation

Quality level	Maximum number of indication	Type of indication	Maximum number each type	Maximum dimension of single indication, mm^2
MT1/PT1	4 in 150 mm length	Non-linear Linear Aligned	4, *see* Note 1 4, *see* Note 1 4, *see* Note 1	5 3 3
MT2/PT2	20 in 22500 mm^2 area	Non-Linear Linear Aligned	10 6 6	7 5 5

NOTES
1. Minimum of 30 mm between relevant indications.
2. In weld repairs, the maximum dimension is 2 mm.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 4.2.3 Ultrasonic acceptance criteria for marine steel castings

Quality level	Allowable disc shape according to the Distance-Gain Size (DGS), mm	Maximum number of indications to be registered, *see* Note 1	Allowable length of linear indications, mm, *see* Note 2
UT1	>6	0	0
UT2	12–15 >15	5 0	50 0

NOTES
1. Grouped in an area measuring 300 x 300 mm.
2. Measured on the scanning surface.

2.6.7 Ultrasonic acceptance criteria for casting areas not nominated in Figs. 4.2.1 to 4.2.6 will be subject to special consideration based on the anticipated stress levels and the type, size and position of the discontinuity.

2.6.8 *Parts which are welded are to be examined by the* same method as at the initial inspection as well as by additional methods as required by the Surveyor.

■ *Section 3* Castings for machinery construction

3.1 Scope

3.1.1 This Section gives the material requirements for carbon-manganese steel castings intenced for use in machinery construction and which are not within the scope of Sections 4 to 7.

3.1.2 Where it is proposed to use steels of higher carbon content than is indicated in 3.2.1, or alloy steels, particulars of the chemical composition, mechanical properties and heat treatment are to be submitted for approval.

3.1.3 The manufacture or repair of cast steel connecting rods is not permitted, except where the manufacturing and *quality control procedures have been approved by LR. For* approval purposes, tests are to be carried out at the place of manufacture using the proposed process to demonstrate that the castings are sound. Tests are to be carried out to confirm that the appropriate mechanical properties are attained within the casting, including areas where weld repairs have been performed. Any changes to manufacturing, repair and quality control procedures are to be submitted to LR for approval, *see also* Ch 1,2.2.

3.2 Chemical composition

3.2.1 The chemical composition of ladle samples is to comply with the following limits, except as specified in 3.2.2:

Carbon	0,40% max.
Silicon	*0,60% max.*
Manganese	0,50–1,60%
Sulphur	0,040% max.
Phosphorus	0,040% max.
Residual elements:	
Copper	0,30% max.
Chromium	0,30% max.
Nickel	0,40% max.
Molybdenum	0,15% max.
	Total 0,80% max.

3.2.2 Castings which are intended for parts of a welded fabrication are to be of weldable quality with a carbon content generally not exceeding 0,23 per cent.

3.2.3 Proposals to use steels with higher carbon content, or alloy steels, for welded construction will be subject to special consideration.

3.3 Heat treatment

3.3.1 Castings are to be supplied:
(a) fully annealed; or
(b) normalised; or
(c) normalised and tempered at a temperature of not less than 550°C; or
(d) quenched and tempered at a temperature of not less than 550°C.

3.3.2 Engine bedplate castings, turbine castings and any other castings where dimensional stability and freedom from internal stresses are important, are to be given a stress relief heat treatment. This is to be at a temperature not lower than 550°C, followed by furnace cooling to 300°C or lower. Alternatively, full annealing may be used provided that the castings are furnace cooled to 300°C or lower.

3.4 Mechanical tests

3.4.1 At least one tensile test is to be made on material representing each casting or batch of castings.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

3.4.2 Where the casting is of complex design, or where the finished mass exceeds 10 tonnes, two test samples are to be provided. Where large castings are made from two or more casts which are not mixed in a ladle prior to pouring, two or more test samples are required corresponding to the number of casts involved. The test samples are to be integrally cast at locations as widely separated as possible.

3.4.3 Table 4.3.1 gives the minimum requirements for yield stress, elongation and reduction of area corresponding to different strength levels, but it is not intended that these should necessarily be regarded as specific grades. Intermediate levels of minimum tensile strength may be specified, in which case minimum values for yield stress, elongation and reduction of area may be obtained by interpolation.

Table 4.3.1 Mechanical properties for acceptance purposes: carbon and carbon-manganese steel castings for machinery construction

Tensile strength N/mm^2	Yield stress N/mm^2 minimum	Elongation on $5{,}65\sqrt{S_0}$ % minimum	Reduction of area % minimum
400–550	200	25	40
440–590	220	22	30
480–630	240	20	27
520–670	260	18	25
560–710	300	15	20
600–750	320	13	20

3.4.4 Castings may be supplied to any specified minimum tensile strength selected within the general limits detailed in Table 4.3.1.

3.4.5 The results of all tensile tests are to comply with the requirements of Table 4.3.1 appropriate to the specified minimum tensile strength.

3.4.6 For alloy steel castings and carbon-manganese steel castings containing more than 0,40 per cent carbon, the results of all mechanical tests are to comply with an approved specification.

3.4.7 When a casting, or a batch of castings, has failed to meet the mechanical test requirements, it may be re-heat treated and re-submitted for acceptance tests but this may not be carried out more than twice, *see* Ch 1,4.6.

3.5 Non-destructive examination

3.5.1 All piston crowns and cylinder covers are to be examined by ultrasonic testing. In addition, where these castings are intended for engines having a bore size larger than 400 mm, they are to be examined by magnetic particle or dye penetrant testing in accordance with 1.7.

3.5.2 Engine bedplate castings are to be examined by ultrasonic and magnetic particle or dye penetrant testing in accordance with 1.7.

3.5.3 Turbine castings are to be examined by magnetic particle or dye penetrant testing in accordance with 1.7. In addition, an ultrasonic or radiographic examination is to be made in way of fabrication weld preparations.

3.5.4 Other castings are to be examined by non-destructive methods where specified.

■ *Section 4* Castings for crankshafts

4.1 Scope

4.1.1 This Section gives the requirements for carbon and carbon-manganese steel castings for semi-built crankshafts.

4.1.2 Where it is proposed to use steels of higher carbon content than is indicated in 4.3.1, or alloy steels, particulars of the chemical composition, mechanical properties and heat treatment are to be submitted for approval. For alloy steels, the specified minimum tensile strength is not to exceed 700 N/mm^2.

4.2 Manufacture

4.2.1 The method of producing combined web and pin castings is to be approved. For this purpose, tests to demonstrate the soundness of the casting and the properties at important locations may be required.

4.3 Chemical composition

4.3.1 The chemical composition of ladle samples is to comply with the following limits:

Carbon	0,40% max. (*but see* 4.7.4(c))
Silicon	0,60% max.
Manganese	0,50–1,60%
Sulphur	0,040% max.
Phosphorus	0,040% max.
Residual elements:	
Copper	0,30% max.
Chromium	0,30% max.
Nickel	0,40% max.
Molybdenum	0,15% max.
	Total 0,80% max.

4.4 Heat treatment

4.4.1 Castings are to be supplied either:

(a) fully annealed and cooled in the furnace to a temperature of 300°C or lower; or

(b) normalised and tempered at a temperature of not less than 550°C, and cooled in the furnace to a temperature of 300°C or lower.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.5 Mechanical tests

4.5.1 Proposals for the number of tests and the location of test material on the casting are to be submitted by the manufacturer.

4.5.2 Not less than one tensile test and three impact tests are to be made on material representing each casting. The impact tests are to be carried out at ambient temperature.

4.5.3 Table 4.4.1 gives the minimum requirements for yield stress and elongation corresponding to different strength levels, and it is not intended that these should necessarily be regarded as specific grades. The strength levels have been given in multiples of 40 N/mm^2 to facilitate interpolation for intermediate values of specified minimum tensile strength.

Table 4.4.1 Mechanical properties for acceptance purposes: carbon-manganese steel castings for crankshafts

Tensile strength N/mm^2	Yield stress N/mm^2 minimum	Elongation on $5{,}65\sqrt{S_o}$ % minimum	Reduction of area % minimum	Charpy V-notch impact tests average energy J minimum (*see* Note)
400–550	200	28	45	32
440–590	220	26	45	28
480–630	240	24	40	25
520–670	260	22	40	20
550–700	275	20	35	18

NOTE
Impact tests are to be made at ambient temperature.

4.5.4 Castings may be supplied to any specified minimum tensile strength selected within the general limits detailed in Table 4.4.1.

4.5.5 The results of all tests are to comply with the requirements of Table 4.4.1 appropriate to the specified minimum tensile strength. For the impact tests, one individual value may be less than the required average value provided that it is not less than 70 per cent of this average value. *See* Ch 1,4.6 for re-test procedures.

4.6 Non-destructive examination

4.6.1 Magnetic particle examination is to be carried out over all surfaces in accordance with Fig. 4.4.1.

4.6.2 Each casting is to be examined by ultrasonic testing, and the extent of examination and defect acceptance criteria, using the DGS (Distance Gain Size) technique, are to be as shown in Fig. 4.4.2. Alternative ultrasonic procedures may be submitted for approval.

4.7 Rectification of defective castings

4.7.1 The requirements of 1.9 apply, except where amended by this Section.

4.7.2 Where castings have shallow surface defects, consideration is first to be given to removing such defects by grinding and blending or by machining the surface where there is excess metal on the Rule dimension.

4.7.3 Subject to prior agreement and submission of the detailed welding procedure for approval by LR, welding may be carried out prior to the final austenitising heat treatment.

4.7.4 Approval for welding will not be given in the following circumstances:

(a) For the rectification of repetitive defects caused by improper foundry technique or practice.

(b) For the building up by welding of surfaces or large shallow depressions.

(c) Where the carbon content of the steel exceeds 0,30 per cent.

(d) Where the carbon equivalent of the steel, given by $C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15}$ exceeds 0,65 per cent.

4.7.5 Provided that the Surveyors are satisfied that welding is justified, they may also authorise welding to the surfaces of crankwebs, following the final austenitising heat treatment, within the following limits:

(a) In general, the volume of the largest groove which is to be welded is not to exceed $3{,}2t$ cm^3, where t is the web axial thickness, in cm. The total volume of all grooves which are to be welded is not to exceed $9{,}6t$ cm^3 per crankweb.

(b) The welds do not extend within the cross-hatched zones marked on Fig. 4.4.3 for semi-built crank throws.

(c) Larger welds on balance weights may be permitted at the discretion of the Surveyor, provided that such repairs are wholly contained within the balance weight and do not affect the strength of the crankweb.

4.7.6 Subsequent to the final austenitising heat treatment, welding may be authorised in the surface of the bore for the journal (or pin) within the following limits:

(a) In general, the welds are to be not less than 125 mm apart.

(b) The welds are not to be located within circumferential bands of $\frac{t}{5}$ from the edges of the bores, nor at any position within the inner 120° arc of the bores, as cross-hatched on Fig. 4.4.3.

(c) The volume of the largest weld is to be not more than $1{,}1t$ cm^3, where t is the web axial thickness at the bore, in cm, and not more than three welds are to be made in any one bore surface.

4.7.7 After all defective material has been removed from a region, and this has been proven in the presence of the Surveyor by magnetic particle inspection or other suitable method, the excavation is to be suitably shaped to allow good access for welding.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

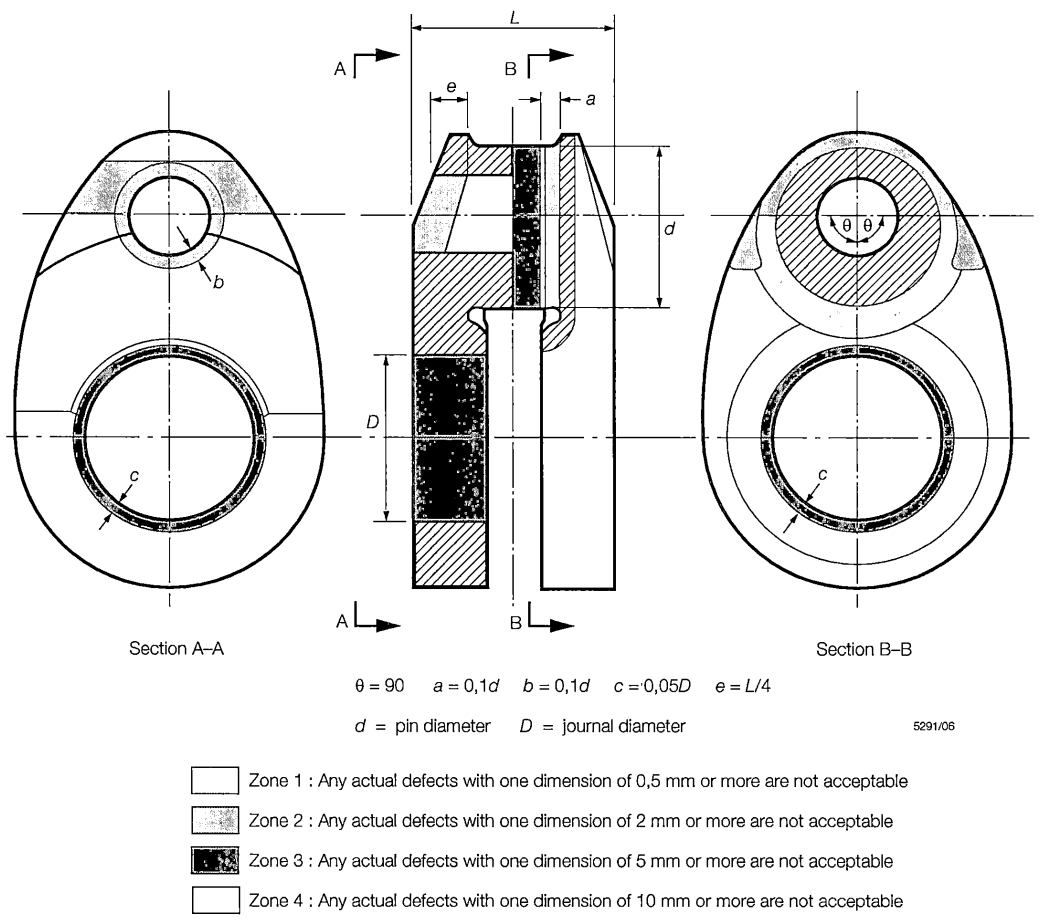

Fig. 4.4.1 Magnetic particle inspection acceptance levels

4.7.8 At the discretion of the Surveyor, the size of a groove may be increased beyond the limiting sizes given in 4.7.5 or 4.7.6, if the removal of further metal will facilitate welding.

4.7.9 Welding is to be carried out by approved welders using approved procedures. The welds are to be made by an electric arc process using low hydrogen type consumables which will produce a deposited metal that is not inferior in properties to the parent metal.

4.7.10 All castings are to be given a preliminary refining heat treatment prior to the commencement of welding. Before welding, the material is to be preheated in accordance with the qualified procedure. Where possible, preheating is to be carried out in a furnace. The preheat temperature is to be maintained until welding is completed, and preferably until the casting is charged to the furnace for post-weld heat treatment.

4.7.11 Where welding is carried out after the final austenitising heat treatments, a post-weld stress relieving heat treatment is to be applied at a temperature of not less than 600°C, *see also* 1.5.2.

4.7.12 Welds are to be dressed smooth by grinding. The surfaces of the welds and adjacent parent steel are to be proven by magnetic particle and, where appropriate, ultrasonic inspection, *see* 1.9.15 and 1.9.14.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

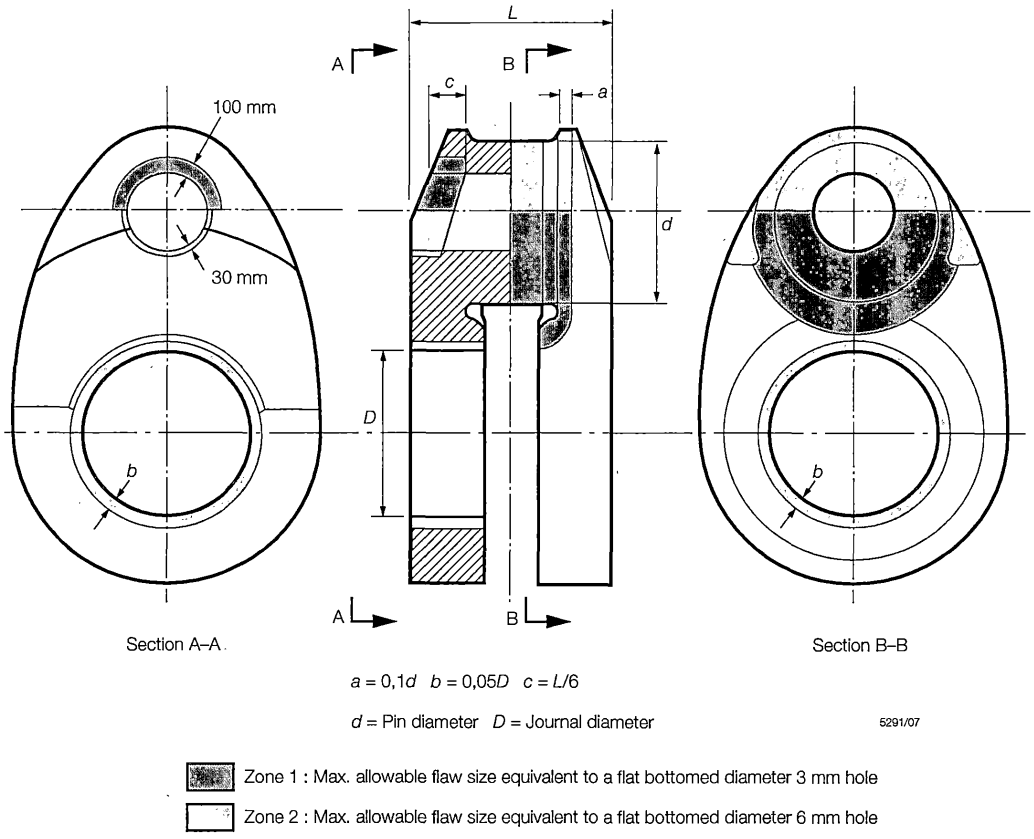

Fig. 4.4.2 Ultrasonic examination acceptance levels

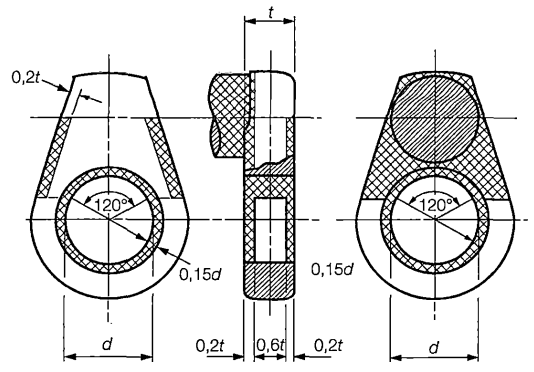

Fig. 4.4.3
Areas of semi-built crank throws to which weld *repairs are* not permitted

■ *Section 5*
Castings for propellers

5.1 Scope

5.1.1 This Section gives the requirements for steel castings for one-piece propellers and separately cast blades and hubs for fixed pitch and controllable pitch propellers (CPP). These include contra-rotating propellers, azipods and azimuth thrusters. The requirements for copper alloy propellers, blades and hubs are given in Ch 9,1.

5.1.2 These castings are to be manufactured and tested in accordance with the appropriate requirements of Chapters 1 and 2 and Ch 4,1 as well as the requirements of this Section.

5.1.3 Full details of the manufacturer's specification are to be submitted for approval. These should include the chemical composition, heat treatment, mechanical properties, microstructure and repair procedures.

5.1.4 Special requirements are given for castings which are intended for ice service in Table 4.5.2.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

5.2 Chemical composition

5.2.1 The chemical composition of ladle samples is to comply with the approved specification, *see* 5.1.3.

5.2.2 Typical cast steel propeller alloys are given in Table 4.5.1.

5.3 Heat treatment

5.3.1 Martensitic stainless steel castings are to be austenitised, quenched and tempered in accordance with the approved specification, *see* 5.1.3.

5.3.2 Austenitic stainless steel castings are to be solution treated in accordance with the approved specification, *see* 5.1.3.

5.4 Mechanical tests

5.4.1 The test material is to be cast integral with the boss of propeller castings, or with the flange of separately cast propeller blades. Alternatively, the test material may be attached on blades in an area between 0,5 and 0,6*R*, where *R* is the radius of the propeller.

5.4.2 The test material is not to be removed from the casting until final heat treatment has been carried out. Removal is to be by non-thermal procedures.

5.4.3 At least one tensile test and for the martensitic stainless steel grades one set of three Charpy V-notch impact tests are to be made on material representing each casting. The results are to comply with the requirements of Table 4.5.2 or the approved specification.

5.4.4 As an alternative to 5.4.3, where a number of small propeller castings of about the same size, and less than 1 m in diameter, are made from one cast and heat treated in the same furnace charge, a batch testing procedure may be adopted using separately cast test samples of suitable dimensions. At least one set of mechanical tests is to be provided for each multiple of five castings in the batch.

5.4.5 Separately cast test bars may be used subject to prior approval of the Surveyor. Test bars must be cast from the same heat, or heats, and must also be heat treated with castings they represent.

5.5 Non-destructive examination

5.5.1 On completion of machining and grinding, the whole surface of each casting is to be examined in accordance with Ch 9,1.8.

5.5.2 When appropriate, magnetic particle inspection may be used in lieu of liquid penetrant testing.

5.5.3 Castings are to be free from cracks and hot tears.

Table 4.5.1 Typical chemical composition for steel propeller castings

Alloy type	C Max. (%)	Mn Max. (%)	Cr (%)	Mo Max. (%) (*see* Note)	Ni (%)
Martensitic (12Cr 1Ni)	0,15	2,0	11,5–17,0	0,5	Max. 2,0
Martensitic (13Cr 4Ni)	0,06	2,0	11,5–17,0	1,0	3,5–5,0
Martensitic (16Cr 5Ni)	0,06	2,0	15,0–17,5	1,5	3,5–6,0
Austenitic (19Cr 11Ni)	0,12	1,6	16,0–21,0	4,0	8,0–13,0

NOTE
Minimum values are to be in accordance with the agreed specification or recognised National or International Standards.

Table 4.5.2 Typical mechanical properties for steel propeller castings

Alloy type	Yield stress or, 0,2% proof stress minimum, N/mm^2	Tensile strength minimum N/mm^2	Elongation on $5{,}65\sqrt{S_o}$ % minimum	Reduction of area % minimum	Charpy V-notch impact tests J minimum (*see* Notes 1 and 2)
Martensitic (12Cr 1Ni)	440	590	15	30	20
Martensitic (13Cr 4Ni)	550	750	15	35	30
Martensitic (16Cr 5Ni)	540	760	15	35	30
Austenitic (19Cr 11Ni)	180 (*see* Note 3)	440	30	40	—

NOTES
1. When a general service notation **Ice Class 1AS, 1A, 1B or 1C** is required, the tests are to be made at –10°C.
2. For general service or where the notation **Ice Class 1D** is required, the tests are to be made at 0°C.
3. $R_{p1,0}$ value is 205 N/mm^2.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

5.6 Rectification of defective castings

5.6.1 The rectification of defective castings is to be undertaken in accordance with 1.9 and the following paragraphs.

5.6.2 Removal of defective material is to be by mechanical means, e.g. by grinding, chipping or milling. The resultant grooves are to be blended into the surrounding surface so as to avoid any sharp contours.

5.6.3 Grinding in severity zone A may be carried out to an extent that maintains the blade thickness. Repair by welding is generally not permitted in zone A and will only be allowed after special consideration.

5.6.4 Defects in severity zone B that are not deeper than $t/40$ mm (t is the minimum local thickness according to the Rules) or 2 mm, whichever is the greater, are to be removed by grinding. Those defects that are deeper may be repaired by welding subject to prior approval of the Surveyor.

5.6.5 Repair welding is generally permitted in severity zone C.

5.6.6 Welds having an area of less than 5 cm^2 are to be avoided. The maximum surface area of repairs is to be in accordance with Table 9.1.4 in Chapter 9.

5.6.7 Welding is to be in accordance with the approved specification, *see* 5.1.3.

5.6.8 After weld repair, the propeller or blade is to be heat treated in such fashion as will minimise the residual stresses. For martensitic stainless steels, this will involve full heat treatment as specified in the approved specification.

5.6.9 LR reserves the right to restrict the amount of repair work accepted from a manufacturer when it appears that repetitive defects are the result of improper foundry techniques or practices.

5.6.10 All welds are to be inspected by the appropriate NDE method, *see* 1.7.

5.7 Identification

5.7.1 Castings are to be clearly marked by the manufacturer in accordance with the requirements of Chapter 1. The following details are to be shown on all castings which have been accepted:

(a) Identification mark which will enable the full history of the item to be traced.
(b) Type of steel, this should include or allow identification of the chromium and nickel contents.
(c) LR or Lloyd's Register and the abbreviated name of Lloyd's Register's local office.
(d) Personal stamp of Surveyor responsible for the final inspection.
(e) LR certificate number.
(f) Skew angle, if in excess of 25°.
(g) Ice class symbol, where applicable.
(h) Date of final inspection.

5.8 Certification of materials

5.8.1 In addition to the requirements in Ch 4,1.11, the manufacturer is to provide the Surveyor with a written statement giving the following particulars for each casting:

(a) Description of casting with drawing number.
(b) Diameter, number of blades, pitch, direction of turning.
(c) Skew angle, if in excess of 25°.
(d) Final mass.
(e) Vessel identification, where known.

■ *Section 6*
Castings for boilers, pressure vessels and piping systems

6.1 Scope

6.1.1 This Section gives the requirements for carbon-manganese and alloy steel castings for boilers, pressure vessels and piping systems for use at temperatures not lower than 0°C.

6.1.2 Where it is proposed to use alloy steels other than as given in this Section, details of the specification are to be submitted for approval. In such cases, the specified minimum tensile strength is not to exceed 600 N/mm^2.

6.1.3 Castings which comply with these requirements are acceptable for liquefied gas piping systems where the design temperature is not lower than 0°C. Where the design temperature is lower than 0°C, and for other applications where guaranteed impact properties at low temperatures are required, the castings are to comply with the requirements of Section 7 or 8.

6.2 Chemical composition

6.2.1 The chemical composition of ladle samples is to comply with the limits specified in Table 4.6.1.

6.3 Heat treatment

6.3.1 Castings are to be supplied:

(a) fully annealed; or
(b) normalised; or
(c) normalised and tempered; or
(d) quenched and tempered.

6.4 Mechanical tests

6.4.1 A tensile test is to be made on material representing each casting, unless a batch testing procedure has been agreed, *see* 1.6.

6.4.2 The tensile test is to be carried out at ambient temperature, and unless agreed otherwise with the Surveyor, the results are to comply with the requirements of Table 4.6.2.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 4.6.1 Chemical composition of steel castings for boilers, pressure vessels and piping systems

Type of steel	Chemical composition %											
	C max.	Si max.	Mn	S max.	P max.	Residual elements						
Carbon-manganese	0,25	0,60	0,50-1,20	0,040	0,040	Cr 0,30 max. Mo 0,15 max. Cu 0,30 max. Ni 0,40 max. Total 0,80 max.						
						Cr	Mo	V	Residual elements Cr	Cu	Ni	
1/2 Mo	0,20	0,60	0,50–1,00	0,040	0,040	—	0,45-0,65	—	0,30 max.	0,30 max.	0,40 max.	
1 Cr 1/2 Mo	0,20	0,60	0,50-0,80	0,040	0,040	1,00-1,50	0,45-0,65	—	—	0,30 max.	0,40 max.	
2 1/4 Cr1 Mo	0,18	0,60	0,40-0,70	0,040	0,040	2,00-2,75	0,90-1,20	—	—	0,30 max.	0,40 max.	
1/2 Cr 1/2 Mo 1/4 V	0,10–0,15	0,45	0,40-0,70	0,030	0,030	0,30-0,50	0,40-0,60	0,22-0,30	—	0,30 max.	0,30 max.	

Table 4.6.2 Mechanical properties for acceptance purposes: steel castings for boilers, pressure vessels and piping systems

Type of steel	Yield stress minimum N/mm^2	Tensile strength N/mm^2	Elongation on $5{,}65\sqrt{S_o}$ % minimum	Reduction of area % minimum
Carbon-manganese	275	485-655	22	25
1/2Mo	260	460-590	18	30
1Cr1/2Mo	280	480-630	17	20
2 1/4 Cr1 Mo	325	540-630	17	20
1/2Cr1/2Mo1/4V	295	510-660	17	20

6.4.3 Where it is proposed to use a carbon-manganese steel with a specified minimum tensile strength intermediate to those given in this Section, corresponding minimum values for the yield stress, elongation and reduction of area may be obtained by interpolation.

6.4.4 Carbon-manganese steels with a specified minimum tensile strength of greater than 490 N/mm^2, but not exceeding 520 N/mm^2, may be accepted provided that details of the proposed specification are submitted for approval.

6.5 Non-destructive examination

6.5.1 The non-destructive examination of castings is to be carried out in accordance with the appropriate requirements of 1.7.7 to 1.7.11 and additionally as agreed between the manufacturer, purchaser and Surveyor.

6.6 Mechanical properties for design purposes

6.6.1 Nominal values for the minimum lower yield or 0,2 per cent proof stress at temperatures of 100°C and higher are given in Table 4.6.3. These values are intended for design purposes only, and verification is not required except for materials complying with National or proprietary specifications where the elevated temperature properties used for design purposes are higher than those given in Table 4.6.3.

6.6.2 In such cases, at least one tensile test at the proposed design or other agreed temperature is to be made on each casting or each batch of castings. The test specimen is to be taken from material adjacent to that used for tests at ambient temperature, and the test procedure is to be in accordance with the requirements of Chapter 2. The results of all tests are to comply with the requirements of the National or proprietary specification.

6.6.3 Values for the estimated average stress to rupture in 100 000 hours are given in Table 4.6.4 and may be used for design purposes.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 4.6.3 Mechanical properties for design purposes (*see* 6.6.1)

Section 7
Ferritic steel castings for low temperature service

7.1 Scope

7.1.1 This Section gives the requirements for castings in carbon-manganese and nickel alloy steels intended for use in liquefied gas piping systems where the design temperature is lower than 0°C, and for other applications where guaranteed impact properties at low temperatures are required.

7.1.2 Where it is proposed to use alternative steels, particulars of the specified chemical composition, mechanical properties and heat treatment are to be submitted for approval.

7.2 Chemical composition

7.2.1 The chemical composition of ladle samples is to comply with the limits specified in Table 4.7.1. Carbon-manganese steels are to be made by fine grain practice.

7.3 Heat treatment

7.3.1 Castings are to be supplied:
(a) normalised; or
(b) normalised and tempered; or
(c) quenched and tempered.

7.4 Mechanical tests

7.4.1 One tensile test and one set of three Charpy V-notch impact test specimens are to be prepared from material representing each casting or batch of castings.

7.4.2 The tensile test is to be carried out at ambient temperature, and the results are to comply with the appropriate requirements given in Table 4.7.2.

7.4.3 The average value for impact test specimens is to comply with the appropriate requirements given in Table 4.7.2. One individual value may be less than the required average value provided that it is not less than 70 per cent of this average value. *See* Ch 2,1.4 for re-test procedure.

7.5 Non-destructive examination

7.5.1 The non-destructive examination of castings is to be carried out in accordance with the appropriate requirements of 1.7.7 to 1.7.11 and additionally agreed between the manufacturer, purchaser and Surveyor.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 4.7.1 Chemical composition of ferritic steel castings for low temperature service

Type of steel	Chemical composition %						
	C max.	Si max.	Mn	S max.	P max.	Ni	Residual elements max.
Carbon-manganese	0,25	0,60	0,70-1,60	0,030	0,030	0,80 max.	Cr 0,25 Cu 0,30 Mo 0,15 V 0,03 Total 0,60

3 1/2Ni	0,15	0,60	0,50-0,80	0,020	0,025	3,00-4,00	

Table 4.7.2 Mechanical properties for acceptance purposes: ferritic steel castings for low temperature service

Type of steel	Grade	Yield stress N/mm^2 minimum	Tensile strength N/mm^2	Elongation on $5,65\sqrt{S_o}$ % minimum	Reduction or area % minimum	Charpy V-notch impact test	
						Test temperature °C	Average energy J minimum
Carbon-manganese	400 430 460	200 215 230	400-550 430-580 460-610	25 23 22	40 35 30	–60 (*see* Note)	27
2 1/4Ni	490	275	490-640	20	35	–70	34
3 1/2Ni	490	275	490-640	20	35	–95	34

NOTE
The test temperature for carbon-manganese steels may be 5°C below the design temperature if the latter is above –55°C, with a maximum test temperature of –20°C.

■ *Section 8*
Stainless steel castings

8.1 Scope

8.1.1 This Section gives the requirements for castings in austenitic and duplex stainless steels for machinery, marine structures, piping systems in ships for liquefied gases, and in bulk chemical tankers.

8.1.2 Austenitic stainless steels castings are suitable for applications where the lowest design temperature is not lower than –165°C.

8.1.3 Duplex stainless steels castings are suitable for applications where the lowest design temperature is above 0°C. Any requirement to use duplex stainless steels castings below 0°C will be subject to special consideration.

8.1.4 Where it is proposed to use alternative steels, particulars of the specified chemical composition, mechanical properties and heat treatment are to be submitted for approval.

8.2 Chemical composition

8.2.1 The chemical composition of ladle samples is to comply with the requirements given in Table 4.8.1.

8.3 Heat treatment

8.3.1 Austenitic stainless steel castings are to be solution treated at a temperature of not less than 1000°C and cooled rapidly in water.

8.3.2 Duplex stainless steels castings are to be solution treated at a temperature of not less that 1100°C and cooled rapidly in water.

8.4 Mechanical tests

8.4.1 One tensile test specimen is to be prepared from material representing each casting or batch of castings. In addition, where the castings are intended for liquefied gas applications, where the design temperature is lower than –55°C, one set of three Charpy V-notch impact test specimens is to be prepared.

8.4.2 The tensile test is to be carried out at ambient temperature, and the results are to comply with the requirements given in Table 4.8.2.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 4.8.1 Chemical composition of stainless steel castings

Type of steel	Chemical composition %								
	C	Si	Mn	S	P	Cr	Mo	Ni	Others
Austenitic									
304L	0,03	0,20-1,5	0,50-2,0	0,040		17,0-21,0	—	8,0–12,0	—
304	0,08						—	8,0–12,0	—
316L	0,03						2,0–3,0	9,0–13,0	—
316	0,08						2,0–3,0	9,0–13,0	—
317	0,08						3,0–4,0	9,0–12,0	—
347 (*see* Note 1)	0,06						—	9,0–12,0	Nb ≥ 8 x C ≤ 0,90
Duplex									
UNS S 31803	0,03	1,00	2,00	0,025	0,035	21,0–23,0	2,5–3,5	4,5–6,5	N 0,08–0,20

NOTES
1. When guaranteed impact values at low temperature are not required, the maximum carbon content may be 0,08% and the maximum niobium may be 1,00%.
2. Where a single value is shown (and not a range of values), the value is to be taken as maximum.

Table 4.8.2 Mechanical properties for acceptance purposes: stainless steel castings

Type of steel	Tensile strength N/mm^2 minimum	1,0% proof stress N/mm^2 minimum	Elongation on $5,65\sqrt{S_o}$ % minimum	Reduction of area % minimum	Charpy V-notch impact tests	
					Test temperature °C	Average energy J minimum
Austenitic						
304L	430	215	26	40	–196	41
304	480	220				
316L	430	215	26	40	–196	41
316	480	220				
317	480	240				
347	480	215	22	35	–196	41
Duplex						
UNS S 31803	600	420	20	35	0	41

8.4.3 The average value for impact test specimens is to comply with the appropriate requirements given in Table 4.8.2. One individual value may be less than the required average value provided that it is not less than 70 per cent of this average value. *See* Ch 2,1.4 for re-test procedures.

8.5 Intergranular corrosion tests

8.5.1 Where corrosive conditions are anticipated in service, intergranular corrosion tests are required on castings in grades 304, 316, 317 and all duplex stainless steels. Such tests may not be required for grades 304L, 316L and 347.

8.5.2 Where an intergranular corrosion test is specified, it is to be carried out in accordance with the procedure given in Ch 2,8.1.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

8.6 Non-destructive examination

8.6.1 The non-destructive examination of castings is to be carried out in accordance with the appropriate requirements of 1.7.7 to 1.7.11 and additionally agreed between the manufacturer, purchaser and Surveyor.

■ *Section 9*
Steel castings for container corner fittings

9.1 General

9.1.1 This Section gives the requirements for cast steel corner fittings used in the fabrication of freight and tank containers. The fittings are also to comply with the requirements of the latest edition of International Standard ISO 1161.

9.1.2 The castings are to be made in foundries approved by LR. These foundries are also to be specially approved for the manufacture of container corner castings. In order to comply with these requirements, the manufacturer is required to verify that the casting soundness, mechanical properties, weldability and dimensional tolerances required by this Section and the manufacturing specification are met.

9.1.3 Castings may be released on the basis of an LR survey or, alternatively, the manufacturer may be approved by means of a Quality Assurance Scheme as detailed in Ch 1,2.

9.2 Chemical composition

9.2.1 Chemical analysis is to be carried out on each cast.

9.2.2 The chemical composition of the ladle samples is to comply with the limits given in Table 4.9.1.

9.2.3 The carbon equivalent:

$$C_{eq} = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15} \ (\%)$$

must not exceed 0,45 per cent.

9.3 Heat treatment

9.3.1 Castings are to be supplied either:

(a) normalised; or

(b) water or oil quenched and tempered at a temperature of not less than 550°C.

9.4 Mechanical tests

9.4.1 At least one tensile test is to be made on each batch of castings, using separately cast test bars which are to be from the same cast and heat treatment lot as the castings they represent.

9.4.2 The results of the tensile tests are to comply with the following:

Yield stress	220 N/mm² min.
Tensile strength	430–600 N/mm²
Elongation on $\sqrt{S_o}$	25% min.
Reduction of area	40% min.

9.4.3 Impact tests are not required on all casts but may be required on a random basis at the discretion of the Surveyor.

9.4.4 When required, the impact test specimens are to be tested in accordance with Ch 1,4.5 and Ch 2,3.2. In general, tests are to be made at a temperature of –20°C and the minimum average energy obtained is to be 27J.

9.5 Non-destructive examination

9.5.1 Ultrasonic or radiographic testing is to be carried out, in accordance with 1.7.10 or 1.7.11 respectively, on at least one casting from each cast or from every 400 castings, whichever is the lesser.

9.6 Repair of defects

9.6.1 Minor defects may be removed by grinding provided that the allowable minus tolerance is not exceeded.

Table 4.9.1 Chemical composition of steel castings for container corner fittings

Chemical composition %										
C max.	Mn	Si max.	P max.	S max.	Cr max.	Ni max.	Cu max.	Mo max.	Al acid soluble min. (*See* Notes)	Cr + Ni + Cu + Mo max.
0,20	0,90 to 1,50	0,50	0,035	0,035	0,25	0,30	0,20	0,08	0,015	0,70

NOTES
1. The total aluminium content may be determined instead of the acid soluble content. In such cases, the total aluminium content is to be not less than 0,02%.
2. Aluminium may be replaced partly or totally by other grain refining elements as stated in the approved specification.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

9.6.2 Defects which exceed the allowable minus tolerance may be removed by grinding or chipping followed by welding, provided the weld depth does not exceed 40 per cent of the wall thickness and that the following requirements are met:

(a) welding is not to be carried out in the as-cast condition; the grain structure has to be refined by heat treatment,
(b) the casting is to be preheated to 80–100°C,
(c) welding is to be performed only by qualified welders in accordance with a qualified welding procedure,
(d) all welded castings are to be post-weld heat treated at a temperature not less than 550°C,
(e) the welded areas are to be ground or machined flush with the adjacent surface and inspected by magnetic particle or dye penetrant examination as appropriate.

9.7 Identification

9.7.1 Each casting is to be clearly marked by the manufacturer with at least the following:

(a) manufacturer's name or trade mark,
(b) cast number or identification number which will enable the full history of the casting to be traced.

9.7.2 Where the casting has been inspected and found acceptable it is to be marked with the Surveyor's personal stamp.

9.7.3 The markings may be stamped or cast on the inner surface of the casting.

9.8 Certification of materials

9.8.1 For each consignment a manufacturer's certificate is to be issued (*see* Ch 1,3.1), containing at least the following:

(a) Purchaser's name and order number.
(b) Grade of steel.
(c) Drawing and/or specification number.
(d) Cast number and chemical composition.
(e) Details of the heat treatment.
(f) Number and weight of the castings.
(g) Results of inspections and mechanical tests.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Steel Forgings

Chapter 5

Section 1

Section

1 **General requirements**

2 **Forgings for ship and other structural applications**

3 **Forgings for shafting and machinery**

4 **Forgings for crankshafts**

5 **Forgings for gearing**

6 **Forgings for turbines**

7 **Forgings for boilers, pressure vessels and piping systems**

8 **Ferritic steel forgings for low temperature service**

9 **Austenitic stainless steel forgings**

Section 1
General requirements

1.1 Scope

1.1.1 This Section gives the general requirements for steel forgings intended for use in the construction of ships, other marine structures, machinery, boilers, pressure vessels and piping systems. These requirements are also applicable to rolled slabs and billets used as a substitute for forgings and to rolled bars used for the manufacture (by machining operations only) of shafts, bolts, studs and other components of similar shape.

1.1.2 When required by the relevant Rules dealing with design and construction, forgings are to be manufactured and tested in accordance with Chapters 1 and 2, together with the general requirements given in this Section and the appropriate specific requirements given in Sections 2 to 9.

1.1.3 As an alternative to 1.1.2, steel forgings which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Chapter or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of Chapter 1.

1.1.4 Normalised forgings with mass up to 1000 kg each and quenched and tempered forgings with mass up to 500 kg each may be batch tested. A batch is to consist of forgings of similar shape and dimensions, made from the same heat of steel, heat treated in the same furnace charge and with a total mass not exceeding 6 tonnes for normalised forgings and 3 tonnes for quenched and tempered forgings, respectively.

1.1.5 A batch testing procedure may also be used for hot rolled bars, *see* 3.4.3.

1.1.6 Where small forgings are produced in large quantities, or where forgings of the same type are produced in regular quantities, alternative survey procedures in accordance with Ch 1,2.4 may be adopted.

1.2 Manufacture

1.2.1 Forgings are to be made at works which have been approved by Lloyd's Register (hereinafter referred to as LR). The steel used is to be manufactured in accordance with the requirements of Ch 3,1.3.

1.2.2 When forgings are made directly from ingots, or from blooms or billets forged from ingots, the ingots are to be cast in chill moulds with the larger cross-section uppermost and with efficient feeder heads.

1.2.3 Adequate top and bottom discards are to be made to ensure freedom from piping and harmful segregations in the finished forgings.

1.2.4 The forgings are to be gradually and uniformly hot worked and are to be formed as closely as possible to the finished shape and size. The plastic deformation is to be such as to ensure soundness, uniformity of structure and satisfactory mechanical properties after heat treatment.

1.2.5 For certain components, such as crankshafts, where grain flow is required in the most favourable direction having regard to the mode of stressing in service, the proposed method of manufacture may require special approval by LR. In such cases, tests may be required to demonstrate that a satisfactory structure and grain flow are obtained.

1.2.6 The reduction ratio (reduction of area expressed as a ratio) is to be calculated with reference to the average cross-sectional area of the ingot or continuously cast material, where appropriate. Where an ingot is initially upset, this reference area may be taken as the average cross-sectional area after this operation.

1.2.7 For components forged directly from ingots or from forged blooms or billets, and in which the fibre deformation is mainly longitudinal, the reduction ratio is not to be less than 3:1.

1.2.8 For forgings made from rolled billets, or where fibre deformation has taken place in more than one direction, the reduction ratio is not to be less than 4:1.

1.2.9 Where rolled bars are used as a substitute for forgings and the requirements of 1.2.2 are not complied with, the reduction ratio is to be not less than 6:1.

1.2.10 Where the length of any section of a shaft forging is less than its diameter (e.g. a collar), the reduction ratio is to be not less than half that given in 1.2.7, 1.2.8 or 1.2.9 respectively.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.2.11 Disc type forgings, such as gear wheels, are to be made by upsetting, and the thickness of any part of the disc is to be not more than one-half of the length of the billet from which it was formed, provided that this billet has received an initial forging reduction of not less than 1,5:1. Where the piece used has been cut directly from an ingot, or where the billet has received an initial reduction of less than 1,5:1, the thickness of any part of the disc is to be not more than one-third of the length of the original piece.

1.2.12 Rings and other types of hollow forgings are to be made from pieces cut from ingots or billets and which have been suitably punched, bored or trepanned prior to expanding or hollow forging. Alternatively, pieces from hollow cast ingots may be used. The wall thickness of the forging is to be not more than one-half of the thickness of the prepared hollow piece from which it was formed. Where this is not practicable, the forging procedure is to be such as to ensure that adequate work is given to the piece prior to punching, etc. This may be either longitudinal or upset working of not less than 2:1.

1.2.13 The shaping of forgings or rolled slabs and billets by flame cutting, scarfing or arc-air gouging is to be undertaken in accordance with recognised good practice and, unless otherwise approved, is to be carried out before the final heat treatment. Preheating is to be employed where necessitated by the composition and/or thickness of the steel. For certain components, subsequent machining of all flame cut surfaces may be required, *see* 4.2.4.

1.2.14 Where two or more forgings are joined by welding to form a composite component, details of the proposed welding procedure are to be submitted for approval. Welding approval procedure tests may be required.

1.3 Quality

1.3.1 All forgings are to be free from surface or internal defects which would be prejudicial to their proper application in service.

1.4 Chemical composition

1.4.1 All forgings are to be made from killed steels, and the chemical composition of ladle samples is to comply with the requirements detailed in subsequent Sections in this Chapter. Where general overall limits are specified, the chemical composition selected is to be appropriate for the type of steel, dimensions and required mechanical properties of the forgings being manufactured.

1.4.2 Except where otherwise specified, suitable grain refining elements such as aluminium, niobium or vanadium may be used at the discretion of the manufacturer. The content of such elements is to be reported in the ladle analysis.

1.4.3 For alloy steel forgings, the chemical composition of ladle samples is to generally comply with the following overall limits and the requirements of the approved specifications:

Carbon	0,45% max.
Silicon	0,45% max.
Manganese	0,30% min.
Sulphur	0,035% max.
Phosphorus	0,035% max.
Copper	0,30% max.

And at least one of the following elements is to comply with the minimum content:

Chromium	0,40% min.
Molybdenum	0,15% min.
Nickel	0,40% min.

The contents of all alloying elements and significant impurities detailed in the specification are to be reported.

1.5 Heat treatment

1.5.1 At an appropriate stage of manufacture, after completion of all hot working operations, forgings are to be suitably heat treated to refine the grain structure and to obtain the required mechanical properties. Acceptable heat treatment procedures are to be such as to avoid the formation of hair-line cracks and are detailed in Sections 2 to 9.

1.5.2 Heat treatment is to be carried out in properly constructed furnaces which are efficiently maintained and have adequate means for control and recording of temperature. The furnace dimensions are to be such as to allow the whole furnace charge to be uniformly heated to the necessary temperature. In the case of very large forgings, alternative methods of heat treatment will be specially considered. Sufficient thermocouples are to be connected to the furnace charge to measure and record that its temperature is adequately uniform. Alternative procedures are to be approved by LR, Materials and NDE Department.

1.5.3 Where forgings are to be quenched and tempered and cannot be hot worked close to size and shape, they are to be suitably rough machined or flame cut prior to being subjected to this treatment.

1.5.4 If for any reason a forging is subsequently heated for further hot working, the forging is to be reheat treated.

1.5.5 If any straightening operation is performed after the final heat treatment, consideration should be given to a subsequent stress relieving heat treatment in order to avoid the possibility of harmful residual stresses.

1.5.6 Where it is intended to surface harden forgings, full details of the proposed procedure and specification are to be submitted for approval. For the purposes of this approval, the manufacturer will be required to demonstrate by tests that the proposed procedure gives a uniform surface layer of the required hardness and depth and that it does not impair the soundness and properties of the steel.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.5.7 Where induction hardening or nitriding is to be carried out after machining, forgings are to be heat treated at an appropriate stage to a condition suitable for this subsequent surface hardening.

1.5.8 Where carburising is to be carried out after machining, forgings are to be heat treated at an appropriate stage (generally either by full annealing or by normalising and tempering) to a condition suitable for subsequent machining and carburising.

1.5.9 The forge is to maintain records of heat treatment identifying the furnace used, furnace charge, thermocouple location, date, temperature and time at temperature. The records are to be presented to the Surveyor on request.

1.6 Test material

1.6.1 Test material, sufficient for the required tests and for possible re-test purposes, is to be provided with a cross-sectional area of not less than that part of the forging which it represents. This test material is to be integral with each forging, except in the case of small forgings which are batch tested, *see* 1.6.4.

1.6.2 Where a forging is subsequently divided into a number of components, all of which are heat treated together in the same furnace charge, for test purposes this may be regarded as one forging and the number of tests required is to be related to the total length and mass of the original multiple forging, *see* 2.4.2.

1.6.3 Except for components which are to be carburised, test material is not to be cut from a forging until the heat treatment detailed in Sections 2 to 9 has been completed. The testing procedure for components which are to be carburised is to be in accordance with the details given in Section 5.

1.6.4 Where a number of small forgings of about the same size are made from one cast and heat treated in the same furnace charge, batch testing procedures (*see* 1.1.4) may be adopted using one of the forgings for test purposes, or alternatively using separately forged test samples. These test samples are to have a forging reduction similar to that used for the forgings which they represent. They are to be properly identified and heat treated together with the forgings.

1.7 Mechanical tests

1.7.1 Specimens for mechanical tests are to be prepared as required by Sections 2 to 9.

1.7.2 Test specimens are normally to be cut with their axes mainly parallel (longitudinal test) or mainly tangential (tangential test) to the principal axial direction of each product.

1.7.3 Unless otherwise agreed, the longitudinal axis of the test specimens is to be positioned as follows:

(a) for thickness or diameter ≤ 50 mm, the axis is to be at the mid-thickness or the centre of the cross-section;

(b) for thickness or diameter > 50 mm, the axis is to be at one quarter thickness (mid-radius) or 80 mm, whichever is less, below any heat treated surface;

Test pieces shall be taken in such a way that no part of the gauge length is machined from material closer than 12,5 mm to any heat treated surface. For impact testing, this requirement is to apply to the complete test piece.

1.7.4 Tensile test specimens are to be machined to the dimensions detailed in Chapter 2. Where this is precluded by the dimensions of the forging, the test specimen is to be of the largest practicable cross-sectional area.

1.7.5 Impact test specimens are to be prepared in accordance with the requirements of Chapter 2.

1.7.6 The procedures used for the tensile and impact tests are to be in accordance with the requirements of Chapter 2.

1.7.7 Hardness tests, preferably of the Brinell type, are to be carried out when specified in subsequent Sections in this Chapter.

1.8 Visual and non-destructive examination

1.8.1 Before acceptance, all forgings are to be presented to the Surveyor for visual examination. Where applicable, this is to include the examination of internal surfaces and bores.

1.8.2 Forgings are to be examined in the condition for final delivery. Surfaces are to be clean and free from dirt, grease, paint, etc. Black forgings are to be suitably descaled by either shotblasting or flame descaling methods.

1.8.3 All forgings are to be free of cracks, crack-like indications, laps, seams, folds, or other injurious indications. At the request of the Surveyor, additional magnetic particle, dye penetrant and ultrasonic testing may be required for a more detailed evaluation of surface irregularities.

1.8.4 When specified in subsequent Sections in this Chapter, or by an approved procedure for welding composite components, *see* 1.2.14, appropriate non-destructive examination is also to be carried out before acceptance. All tests are to be carried out in accordance with the requirements of Ch 1,5.

1.8.5 Magnetic particle and dye penetrant testing is to be carried out when the forgings are in the finished machined condition, *see also* Ch 1,2.3.5. For magnetic particle testing, attention is to be paid to the contact between the forging and the clamping devices of stationary magnetisation benches in order to avoid local overheating or burning damage on its surface. Prods are not permitted on finished machined items. Unless otherwise agreed, these tests are to be carried out in the presence of the Surveyor.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.8.6 The following definitions apply to indications associated with magnetic particle and dye penetrant inspection:

(a) **Linear indication.** An indication in which the length is at least three times the width.

(b) **Nonlinear indication.** An indication of circular or elliptical shape with a length less than three times the width.

(c) **Aligned indication.** Three or more indications in a line, separated by 2 mm or less edge-to-edge.

(d) **Open indication.** An indication visible after removal of the magnetic particles or that can be detected by the use of contrast dye penetrant.

(e) **Non-open indication.** An indication that is not visually detectable after removal of the magnetic particles or that cannot be detected by the use of contrast dye penetrant.

(f) **Relevant indication.** An indication that is caused by a condition or type of discontinuity that requires evaluation. Only indications which have any dimension greater than 1,5 mm are to be considered relevant.

1.8.7 Acceptance standards for defects found by visual or non destructive examinations are to be in accordance with any specific requirements of the approved plan, and with any additional requirements of this Chapter. In all cases they are to be to the satisfaction of the Surveyor.

1.8.8 Where required, ultrasonic examination is to be carried out after the forgings have been machined to a condition suitable for this type of examination and after the final heat treatment. Both radial and axial scanning are to be carried out where appropriate for the shape and the dimensions of the forgings being examined. Unless otherwise agreed, this examination is to be carried out by the manufacturer, although Surveyors may request to be present in order to verify that the examination is being carried out in accordance with the agreed procedure.

1.8.9 If the forging is supplied in the black condition for machining at a separate works, the manufacturer is to ensure that a suitable ultrasonic examination is carried out to verify the internal quality of the forging.

1.8.10 In the circumstance detailed in either 1.8.8 or 1.8.9, the manufacturer is to provide the Surveyor with a signed report confirming that ultrasonic examination has been carried out and that such inspection has not revealed any significant internal defects.

1.8.11 Unless otherwise agreed, the accuracy and verification of dimensions are the responsibility of the manufacturer.

1.8.12 In the event of any forging proving defective during subsequent machining or testing, it is to be rejected notwithstanding any previous certification.

1.8.13 When required by the conditions of approval for surface hardened forgings (*see* 1.5.6) additional test samples are to be processed at the same time as the forgings which they represent. These test samples are subsequently to be sectioned in order to determine the hardness, shape and depth of the locally hardened zone and which are to comply with the requirements of the approved specification.

1.9 Rectification of defects

1.9.1 Small surface imperfections may be removed by grinding or by chipping and grinding. Complete elimination of these imperfections is to be proved by magnetic particle or dye penetrant examination (as appropriate to the material). At the discretion of the Surveyor, the resulting shallow grooves or depressions can be accepted, provided that they are blended by grinding.

1.9.2 Repairs by welding are not generally permitted, but special consideration will be given to such repairs where they are of a minor nature and in areas of low working stresses. In such cases, full details of the proposed repair and subsequent inspection procedures are to be submitted for review by the Surveyors prior to the commencement of the proposed rectification. A report and/or sketch detailing the extent and location of all repairs, together with details of the post-weld heat treatment and non-destructive examination are to be provided for record purposes and are to be attached to the certificate.

1.9.3 Repair welding is not permitted for crankshafts or similar rotating components.

1.9.4 Where fabrication welding is involved, *see* 1.2.14, any repair of defects is to be carried out in accordance with the approved welding procedure.

1.9.5 The forging manufacturer is to maintain records of repairs and subsequent inspections traceable to each forging. The records are to be presented to the Surveyor on request.

1.9.6 Non-open indications evaluated as segregation are acceptable.

1.10 Identification

1.10.1 The manufacturer is to adopt a system of identification, which will enable all finished forgings to be traced to the original cast, forging process and heat treatment batch, and the Surveyor is to be given full facilities for so tracing the castings when required.

1.10.2 Forgings are to be clearly marked by the manufacturer in accordance with the requirements of Chapter 1. The following details are to be shown on all forgings which have been accepted:

(a) Identification number, cast number or other marking which will enable the full history of the forging to be traced.

(b) LR or Lloyd's Register and the abbreviated name of LR's local office.

(c) Personal stamp of Surveyor responsible for inspection.

(d) Test pressure, where applicable.

(e) Date of final inspection.

1.10.3 Modified arrangements for the identification of small forgings manufactured in large numbers, as with closed-die forgings may be agreed with the Surveyor.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.11 Certification of materials

1.11.1 A LR certificate is to be issued, *see* Ch 1,3.1.

1.11.2 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each forging or batch of forgings which has been accepted:
(a) Purchaser's name and order number.
(b) Description of forgings and steel quality.
(c) Identification number.
(d) Steelmaking process, cast number and chemical analysis of ladle samples.
(e) General details of heat treatment.
(f) Results of mechanical tests.
(g) Test pressure, where applicable.

1.11.3 As a minimum, the chemical composition of ladle samples is to include the content of all the elements detailed in the specific requirements.

1.11.4 Where applicable, the manufacturer is also to provide a signed report regarding ultrasonic examination as required by 1.8.8, a report of magnetic particle inspection and a statement and/or sketch detailing all repairs by welding as required by 1.9.2.

1.11.5 When steel is not produced at the works at which it is forged, a certificate is to be supplied by the steelmaker stating the process of manufacture, cast number and the chemical composition of ladle samples. The works at which the steel was produced is to have been approved by LR, *see* 1.4.3.

■ *Section 2*
Forgings for ship and other structural applications

2.1 Scope

2.1.1 This Section gives the specific requirements for carbon-manganese steel forgings intended for ship and other structural applications such as rudder stocks, pintles, etc.

2.1.2 Where it is proposed to use an alloy steel, particulars of the chemical composition, mechanical properties and heat treatment are to be submitted for approval, *see* 1.4.3.

2.2 Chemical composition

2.2.1 For forgings to which structural items are to be attached by welding or which are intended for parts of a fabricated component, or are to be weld cladded or may be subject to weld repair in service, the chemical composition of ladle samples is to comply with the following:

Carbon	0,23% max.
Silicon	0,45% max.
Manganese	0,30–1,50% but not less than 3 times the actual carbon content for components which are not given a post-weld heat treatment
Sulphur	0,035% max.
Phosphorus	0,035% max.
Residual elements:	
Copper	0,30% max.
Chromium	0,30% max.
Molybdenum	0,15% max.
Nickel	0,40% max.
Total	0,85% max.

For samples from forgings, the carbon content is not to exceed 0,26 per cent.

2.2.2 It is recommended that forgings for rudder stocks, pintles and rudder coupling bolts comply with 2.2.1 in order to obtain satisfactory weldability for any future repairs by welding in service.

2.2.3 For forgings not intended for welding the carbon content may be 0,65 per cent max., *see* 3.2.1.

2.3 Heat treatment

2.3.1 Carbon-manganese steel forgings are to be:
(a) fully annealed; or
(b) normalised; or
(c) normalised and tempered at a temperature of not less than 550°C.
(d) quenched and tempered.

2.3.2 Alloy steel forgings are to be quenched and then tempered at a temperature of not less than 550°C. Alternatively, they may be supplied in the normalised and tempered condition, in which case the specified mechanical properties are to be agreed by LR.

2.4 Mechanical tests

2.4.1 At least one tensile specimen is to be taken from each forging or batch of forgings.

2.4.2 Where a forging exceeds both 4 tonnes in mass and 3 m in length, tensile test specimens are to be taken from each end. These limits refer to the 'as forged' mass and length but exclude the test material.

2.4.3 Unless otherwise agreed between the manufacturer and the Surveyor, the test specimens are to be cut in a longitudinal direction.

2.4.4 The results of all tensile tests are to comply with the requirements given in Table 5.2.1 appropriate to the specified minimum tensile strength. Forgings may be supplied to any specified minimum tensile strength within the general limits given in Table 5.2.1, and intermediate values may be obtained by interpolation. *See* 2.4.6 for rudder stocks, pintles, and rudder coupling keys and bolts.

2.4.5 For large forgings, where tensile tests are taken from each end, the variation in tensile strength is not to exceed 70 N/mm^2.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 5.2.1 Mechanical properties for ship and other structural applications

Steel type	Yield stress N/mm² minimum	Tensile strength N/mm²	Elongation on $5{,}65\sqrt{S_o}$ min.%		Reduction of area min. %	
			Long.	Tang.	Long.	Tang.
C and C-Mn	180	360-480	28	20	50	35
	200	400-520	26	19	50	35
	220	440-560	24	18	50	35
	235	470-590	23	17	45	35
	240	480-600	22	16	45	30
	260	520-640	21	15	45	30
	280	560-680	20	14	40	27
	300	600-750	18	13	40	27
	320	640-790	17	12	40	27
	340	680-830	16	12	35	24
	360	720-870	15	11	35	24
	380	760-910	14	10	35	24
Alloy	350	550-570	20	14	50	35
	400	600-750	18	13	50	35
	450	650-800	17	12	50	35

2.4.6 For rudder stocks, pintles, and rudder coupling keys and bolts, the minimum specified yield strength is not to be less than 200 N/mm², *see* Table 13.2.4 in Pt 3, Ch 13.

2.4.7 Impact tests are required for rudder stocks to be fitted to vessels which have an ice class notation. The tests are to be carried out at minus 10°C and the average energy value is to be not less than 27J.

2.5 Non-destructive examination

2.5.1 Surface inspections are to be carried out by visual examination and magnetic particle testing (or dye penetrant testing where appropriate).

2.5.2 Surface inspections are to be carried out in the zones I and II as indicated in Fig. 5.2.1.

2.5.3 For the purpose of evaluating indications, the surface is to be divided into reference areas of 225 cm². The area is to be taken in the most unfavourable location relative to the indication being evaluated.

2.5.4 The allowable number and size of indications in the reference area is given in Table 5.2.2.

2.5.5 Volumetric inspection is to be carried out by ultrasonic testing using the contact method.

2.5.6 Ultrasonic testing is to be carried out on rudder stocks having a finished diameter of 200 mm or greater.

2.5.7 Ultrasonic testing is to be carried out in the zones I to III as indicated in Fig. 5.2.2. Areas may be upgraded to a higher zone at the discretion of the Surveyors.

Table 5.2.2 Steel forgings surface inspection

Inspection zone	Maximum number of indications	Type of indication	Maximum number each type	Maximum dimension, mm
I	3	Linear Non-linear Aligned	0, *see* Note 3 0, *see* Note	— 3,0 —
II	10	Linear Non-linear Aligned	3, *see* Note 7 3, *see* Note	3,0 5,0 3,0

NOTE
Linear or aligned indications are not permitted on bolts, which receive a direct fluctuating load, e.g. main bearing bolts, connecting rod bolts, crosshead bearing bolts and cylinder cover bolts.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Section 3
Forgings for shafting and machinery

3.1 Scope

3.1.1 Detailed in this Section are the requirements for carbon-manganese steel forgings for shafting and other items of machinery which are not within the scope of Sections 4 to 8.

3.1.2 Where it is proposed to use alloy steel forgings, particulars of the chemical composition, mechanical properties and heat treatment are to be submitted for approval. For main propulsion shafting in alloy steels, the specified minimum tensile strength is not to exceed 800 N/mm^2 (800–950 N/mm^2 acceptance range) and for other forgings is not to exceed 1100 N/mm^2 (1100–1300 N/mm^2 acceptance range).

3.2 Chemical composition

3.2.1 The chemical composition of ladle samples for carbon and carbon-manganese steels is to comply with the following overall limits:

Carbon	0,65% max.
Silicon	0,45% max.
Manganese	0,30–1,50%
Sulphur	0,035% max.
Phosphorus	0,035% max.
Residual elements:	
Copper	0,30% max.
Chromium	0,30% max.
Molybdenum	0,15% max.
Nickel	0,40% max.
Total	*0,85% max.*

3.2.2 For alloy steels, *see* 1.4.3.

3.2.3 For forgings to which structural items are to be attached by welding, or which are intended for parts of a fabricated component, are to be of weldable quality, *see* 2.2.1.

3.3 Heat treatment

3.3.1 Forgings are to be:
(a) fully annealed; or
(b) normalised; or
(c) normalised and tempered; or
(d) quenched and tempered.
The tempering temperature is to be not less than 550°C.

3.4 Mechanical tests

3.4.1 At least one tensile test is to be made on each forging, or each batch of forgings. Impact tests are not required except on screwshafts for ice service, *see* 3.4.12.

3.4.2 Where a forging exceeds both 4 tonnes in mass and 3 m in length, a tensile test is to be taken from each end. These limits refer to the 'as forged' mass and length but exclude the test material.

3.4.3 A batch testing procedure may be used for hot rolled bars not exceeding 250 mm diameter, which are intended for the manufacture (by machining operations only) of straight shafting, bolts, studs and other machinery components of similar shape. A batch is to consist of either:
(a) material from the same piece provided that where this is cut into individual lengths, these are all heat treated in the same furnace charge; or
(b) bars of the same diameter and cast, heat treated in the same furnace charge and with a total mass not exceeding 2,5 tonnes.

3.4.4 The test specimens are to be taken in the longitudinal direction but, at the discretion of the manufacturer and if agreed by the Surveyor, alternative directions or positions as shown in Figs. 5.3.1 to 5.3.3 may be used.

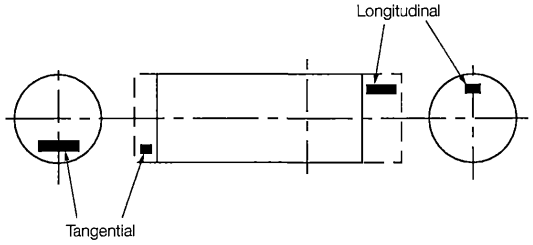

Fig. 5.3.1
Directions and positions of test specimens

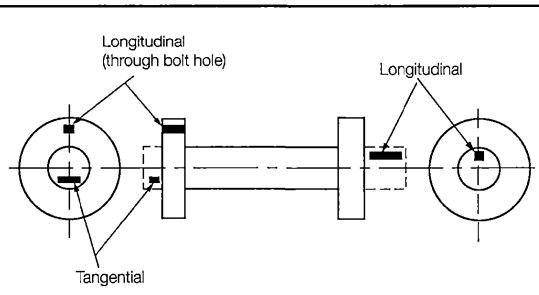

Fig. 5.3.2
Directions and positions of test specimens

3.4.5 For carbon-manganese steels, Table 5.3.1 gives the minimum requirements for yield stress, elongation and reduction of area, corresponding to different strength levels, but it is not intended that these should necessarily be regarded as specific grades. Intermediate values for other specified minimum tensile strengths should be calculated by interpolation.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

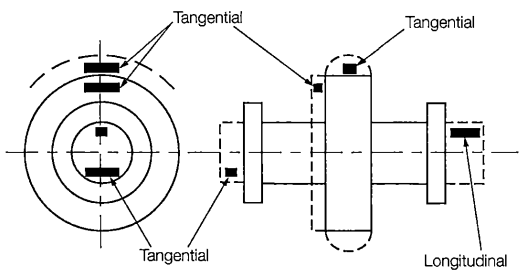

Fig. 5.3.3
Directions and positions of test specimens

3.4.6 Forgings may be supplied to any specified minimum tensile strength selected within the general limits detailed in Table 5.3.1, except that for main propulsion shafting forgings the specified minimum tensile strength is to be not less than 400 N/mm^2 (400–520 N/mm^2 acceptance range) and not greater than 600 N/mm^2 (600–750 N/mm^2 acceptance range) *see* shaded area of Table 5.3.1.

3.4.7 The results of all tensile tests are to comply with the requirements given in Table 5.3.1 appropriate to the specified minimum tensile strength.

3.4.8 The minimum requirements for yield stress, elongation and reduction of area, corresponding to different strength levels in alloy steel forgings are given in Table 5.3.2.

Table 5.3.1 Mechanical properties for acceptance purposes: carbon and carbon-manganese steel forgings for machinery and shafting

Tensile strength N/mm^2	Yield stress N/mm^2	Elongation on $5{,}65\sqrt{S_o}$ min.%		Reduction of area min. %	
		Long.	Tang.	Long.	Tang.
360-480	180	28	20	50	35
400-520	200	26	19	50	35
440-560	220	24	18	50	35
470-590	235	23	17	45	35
480-600	240	22	16	45	30
520-640	260	21	15	45	30
560-680	280	20	14	40	27
600-750	300	18	13	40	27
640-790	320	17	12	40	27
680-830	340	16	12	35	24
700-850 [2]	350	15	11	35	24
720-870 [2]	360	15	11	35	24
760-910 [2]	380	14	10	35	24

NOTES
1. For main propulsion shafting forgings, the specified minimum tensile strength is to be between 400 and 600 N/mm^2 (shaded area of Table) *see* 3.4.6.
2. Where the specified minimum tensile strength exceeds 700 N/mm^2, forgings are to be supplied only in the quenched and tempered condition.

Table 5.3.2 Mechanical properties for acceptance purposes: alloy steel forgings for machinery and shafting

Tensile strength N/mm^2	Yield stress N/mm^2	Elongation on $5{,}65\sqrt{S_o}$ min.%		Reduction of area min. %	
		Long.	Tang.	Long.	Tang.
600-750	420	18	14	50	35
650-800	450	17	13	50	35
700-850	480	16	12	45	30
750-900	530	15	11	45	30
800 -950	580	14	10	40	27
850-1000	630	13	9	40	27
900-1100	690	13	9	40	27
950-1150	750	12	8	35	24
1000-1200	810	12	8	35	24
1050-1250	870	11	7	35	24
1100-1300	930	11	7	35	24

NOTE
For main propulsion shafting forgings, the minimum specified tensile strength is not to exceed 800 N/mm^2, *see* 3.4.9 (shaded area of Table).

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

3.4.9 Forgings in alloy steels may be supplied to any specified minimum tensile strength selected within the general limits detailed in Table 5.3.2, and minimum yield stress, elongation and reduction of area, obtained by interpolation, except that for main propulsion shafting forgings the specified minimum tensile strength is not to exceed 800 N/mm^2 (800–950 N/mm^2 acceptance range) *see* shaded area of Table 5.3.2.

3.4.10 The results of all tensile tests are to comply with the requirements given in Table 5.3.2 appropriate to the specified minimum tensile strength.

3.4.11 Where more than one tensile test is taken from a forging, the variation in tensile strength is not to exceed the following:

Specified minimum tensile strength N/mm^2	Difference in tensile strength N/mm^2
<600	70
≥600 < 900	100
≥900	120

3.4.12 For screwshafts intended for ships with the notation **Ice Class 1AS** or **1A** and where the connection between the propeller and the screwshaft is by means of a key, a set of three Charpy V-notch impact tests (longitudinal test) is to be made on material from the propeller end of each shaft. The tests are to be carried out at –10°C and the average energy value is to be not less than 20 J.

3.5 Non-destructive examination

3.5.1 Magnetic particle or dye penetrant testing (where appropriate) is to be carried out on forgings for main propulsion shafting (including propeller shafts, intermediate shafts, and thrust shafts with minimum diameter not less than 100 mm), on all connecting rod, piston rod, and crosshead forgings and on the following components when they are intended for engines having a bore diameter larger than 400 mm:

- Cylinder covers
- Piston crowns
- Piston rods
- Tie rods
- Gear wheels for camshaft drives
- Bolts and studs for:
  - Cylinder covers
  - Crossheads
  - Main bearings
  - Connecting rod bearings
  - Propeller blade fastening bolts
  - Crankpin bolts
  - Tie rod bolts

  Additionally, bolts for engine bore diameters of less than 400 mm but having a minimum diameter 50 mm or greater (which are subjected to dynamic stress), are also to be subjected to surface examinations.

3.5.2 The areas to be tested by magnetic particle or dye penetrate testing are shown in Fig. 5.3.4 and Fig. 5.3.5. Areas of other components not shown in these figures are to be agreed with the Surveyor. For tie rods, only threaded portions and the adjacent material over a length equal to that of the thread need be tested.

3.5.3 Surface inspection acceptance criteria are to be in accordance with 2.5. Other acceptance criteria may be applied, providing they meet these minimum criteria, and are to the satisfaction of the Surveyor.

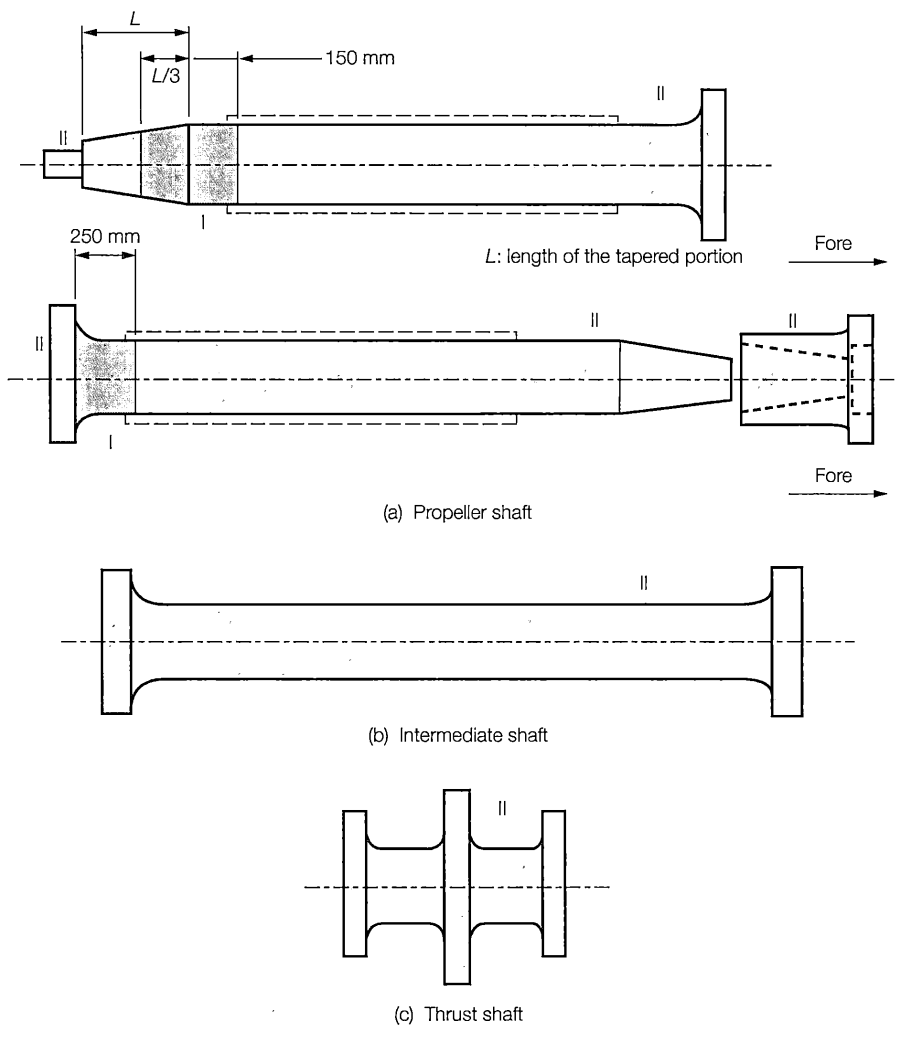
3.5.4 Ultrasonic testing is to be carried out in accordance with 2.5 on the following items:

(a) Shafts having a finished diameter of 200 mm or larger when intended for main propulsion or other essential services.
(b) All piston crowns and cylinder covers.
(c) Piston rods, connecting rods and crossheads for engines having a bore diameter greater than 200 mm.

The areas to be tested are shown in Fig. 5.3.6 and Fig. 5.3.7. Areas of other components not shown in these drawings are to be agreed with the Surveyor.

3.5.5 Ultrasonic acceptance criteria are shown in Table 5.3.4. Other acceptance criteria may be applied, providing they meet these minimum criteria, and are to the satisfaction of the Surveyor.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.



(a) Propeller shaft

(b) Intermediate shaft

(c) Thrust shaft

NOTE
For propeller shaft, intermediate shafts and thrust shafts, all areas with stress raisers such as radial holes, slots and key ways are to be treated as Zone I.

Fig. 5.3.4 Zones for magnetic particle/dye penetrant testing on machinery components

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

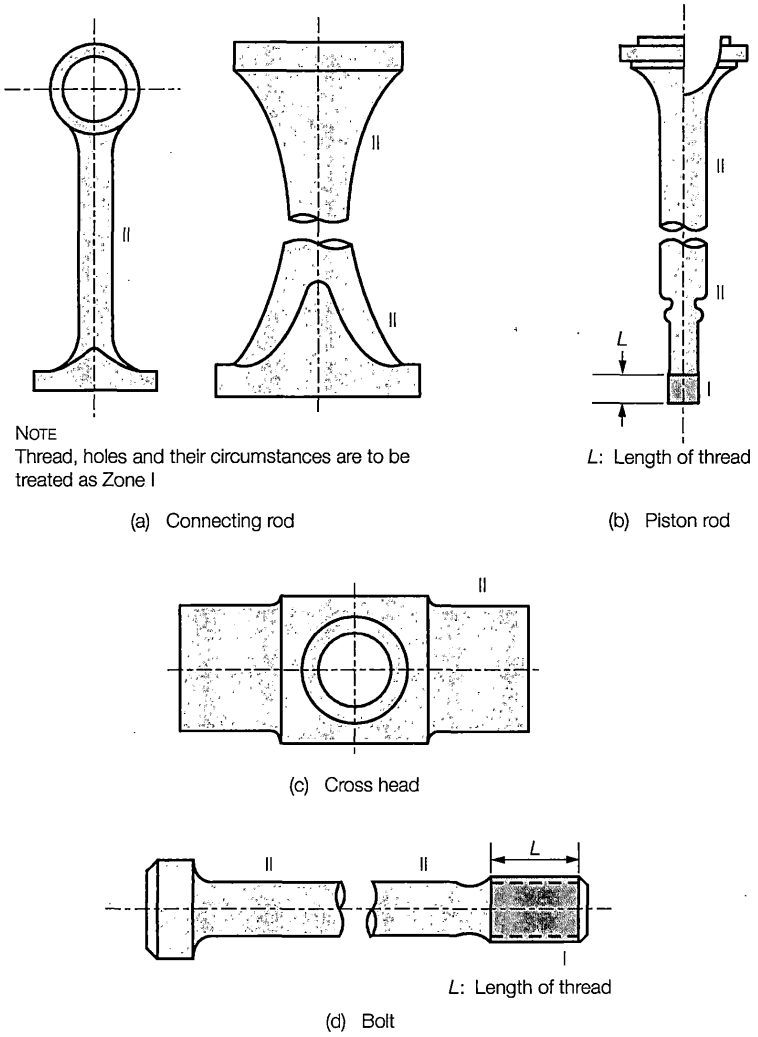


Fig. 5.3.5 *Zones for magnetic particle/dye penetrant testing on machinery components*

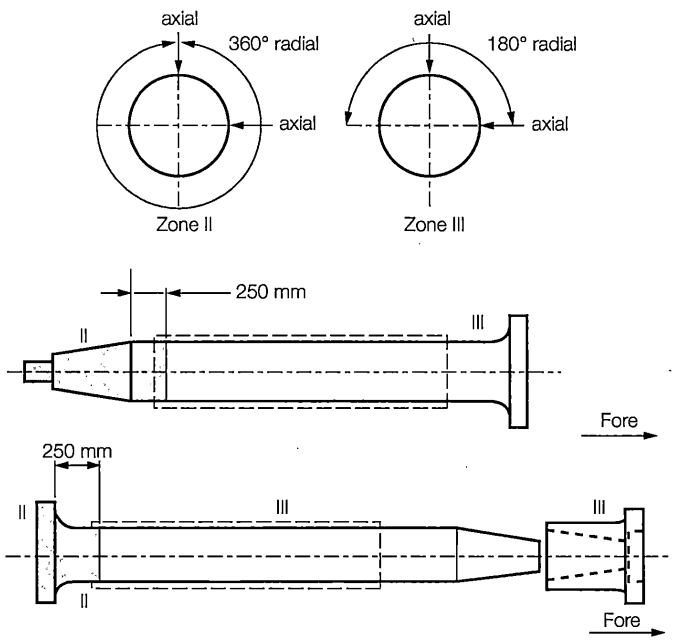
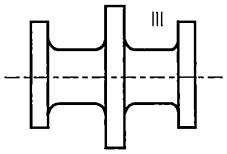
Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.



(a) Propeller shaft

(b) Intermediate shaft



(c) Thrust shaft

NOTES
1. For hollow shafts, 360° radial scanning applies to Zone III
2. Circumferences of the bolt holes in the flanges are to be treated as Zone II

Fig. 5.3.6 Zones for ultrasonic testing on shafts

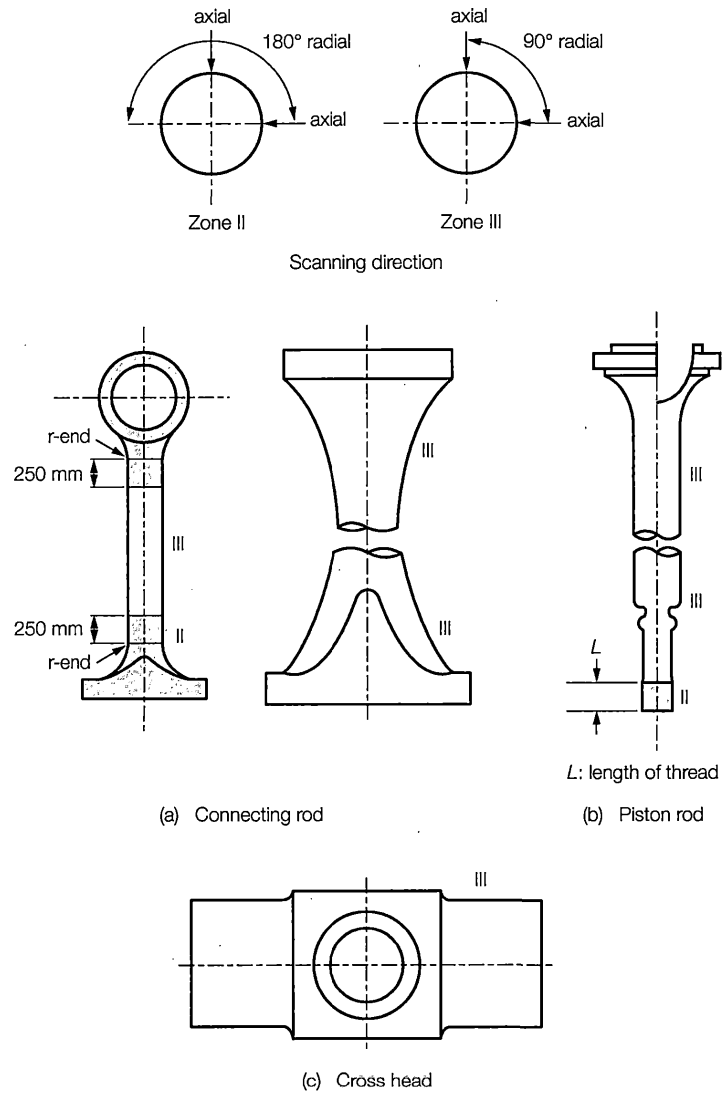

Fig. 5.3.7 Zones for ultrasonic testing on machinery components

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 5.3.4 Acceptance criteria for ultrasonic testing

Type of forging	Zone	Allowable disc shape according to Distance Gain Size (DGS), *see* Note 1, mm	Allowable length of indication, mm	Allowable distance between two indications, *see* Note 2, mm
Propeller shaft Intermediate shaft	II	Outer $d \leq 2$ Inner $d \leq 4$	≤10 ≤15	≥20 ≥20
Thrust shaft Rudder stock	III	Outer $d \leq 3$ Inner $d \leq 6$	≤10 ≤15	≥20 ≥20
Connecting rod Piston rod Crosshead	II	$d \leq 2$	≤10	≥20
	III	$d \leq 4$	≤10	≥20

NOTES
1. Outer part means the part beyond one third of the shaft radius from the centre. The inner part means the remaining core area.
2. For accumulations of two or more isolated indications which are subjected to registration, the minimum distance between two neighbouring indications is to be at least the length of the larger indication.

■ *Section 4*
Forgings for crankshafts

4.1 Scope

4.1.1 The specific requirements for solid forged crankshafts and forgings for use in the construction of fully built and semi-built crankshafts are detailed in this Section.

4.1.2 Where it is proposed to use alloy steel forgings, particulars of the chemical composition (*see* 1.4.3), heat treatment and mechanical properties are to be submitted for approval. The specified minimum tensile strength is not to exceed 1000 N/mm^2 (1000–1200 N/mm^2 acceptance range).

4.2 Manufacture

4.2.1 For closed die and continuous grain flow crankshafts forgings, where an allowance is given for design purposes, full details of the proposed method of manufacture are to be submitted for approval. In such cases, tests will be required to demonstrate that a satisfactory structure and grain flow are obtained. The number and positions of test specimens are to be agreed with LR.

4.2.2 For the manufacture of welded crankshafts, approval is required for the welding procedure.

4.2.3 For combined crankweb and pin forgings, the proposed method of forging is to be submitted for approval. It is recommended that these forgings be made by a folding method. Other methods which can be shown to produce sound forgings with satisfactory mechanical properties will be considered, but where the gapping method is used for cranks having a pin diameter exceeding 510 mm this will only be accepted provided that an upsetting operation is included in the manufacturing sequence. In general, the amount of work during the upsetting operation is to be such that the reduction in the original length of the ingot (after discard) or bloom is not less than 50 per cent.

4.2.4 Where crankwebs are flame cut from forged or rolled slabs, the procedure used is to be in accordance with 1.2.13, and additionally, unless specially agreed, a depth of at least 7,5 mm is to be removed by machining from all flame-cut surfaces.

4.3 Chemical composition

4.3.1 The chemical composition of ladle samples is to comply with 3.2.1 for carbon and carbon-manganese steels and 1.4.3 for alloy steels.

4.3.2 For alloy steel forgings which are to be nitrided, the phosphorus or sulphur contents are not to exceed 0,02 per cent.

4.4 Heat treatment

4.4.1 For forgings in all types of steels, heat treatment is to be either:
(a) normalising and tempering, or
(b) quenching and tempering.
The temperature used for tempering is to be not less than 550°C.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.4.2 Where it is proposed to surface harden crankshaft forgings by nitriding or induction hardening, full details of the proposed procedure are to be submitted as required by 1.5.6.

4.5 Mechanical tests

4.5.1 At least one tensile test specimen is to be taken from each forging.

4.5.2 For solid forged crankshafts, tests are to be taken in the longitudinal direction from the coupling end of each forging (test position A in Fig. 5.4.1). Where the mass, as heat treated but excluding test material, exceeds 3 tonnes, a second set of tests is to be taken from the end opposite the coupling, in addition (test position B in Fig. 5.4.1). Where the crankthrows are formed by machining or flame cutting, the second set of tests is to be taken in a tangential direction from material removed from the crankthrow at the end opposite the coupling (test position C in Fig. 5.4.1).For continuous grain flow (CGF) crankshaft forgings, where insufficient material exists for a second longitudinal test, the second set of tests may be taken in a tangential direction from the crankthrow (test position C in Fig. 5.4.2).

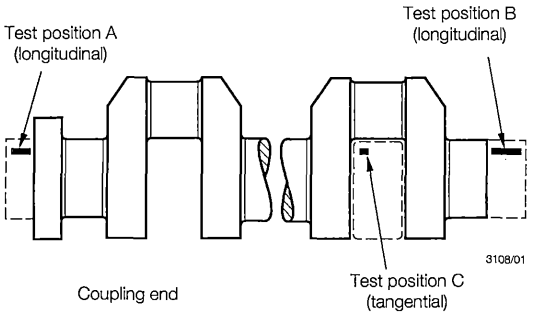

Fig. 5.4.1 Solid forged crankshaft

4.5.3 The number and position of test specimens from combined crankweb and pin forgings are to be in accordance with the requirements of the approved method of manufacture.

4.5.4 For other crankshaft forgings, tests are to be taken as detailed in Section 3, except that for crankwebs the test specimens are to be cut in a tangential direction.

4.5.5 As an alternative to 4.5.2, small solid forged crankshafts may be batch tested in accordance with 1.6.4, provided that, in addition, hardness tests are carried out on each forging.

4.5.6 Tables 5.4.1 to 5.4.3 give the minimum requirements for yield stress and elongation corresponding to different strength levels, but it is not intended that these should necessarily be regarded as specific grades. The strength levels have been given in multiples of 40 N/mm^2, or 50 N/mm^2 in the case of alloy steels, to facilitate interpolation for intermediate values of specified minimum tensile strength.

Table 5.4.1 Mechanical properties for acceptance purposes: carbon-manganese steel forgings for crankshafts

Tensile strength N/mm^2	Yield stress N/mm^2 minimum	Elongation on $5{,}65\sqrt{S_o}$ % minimum		Hardness Brinell
		Long.	Tang.	
400–520	200	26	19	110–150
440–560	220	24	18	125–160
480–600	240	22	16	135–175
520–640	260	21	15	150–185
560–680	280	20	14	160–200
600–750	300	18	13	175–215
640–790	320	17	12	185–230
680–830	340	16	12	200–240
720–870	350	15	11	210–250
760–910	380	14	18	225–265
Intermediate values may be obtained by interpolation.				

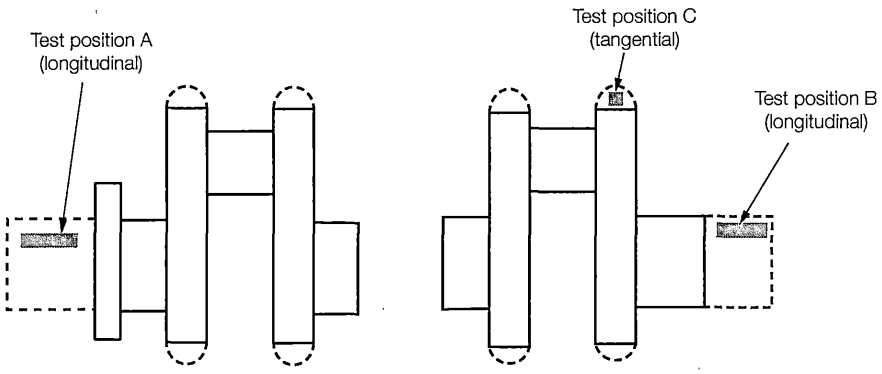

Fig. 5.4.2 CGF Crankshaft

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 5.4.2 Mechanical properties for acceptance purposes: alloy steel forgings for crankshafts – Normalised and tempered

Tensile strength N/mm²	Yield stress N/mm² minimum	Elongation on $5{,}65\sqrt{S_o}$ % minimum		Hardness Brinell
		Long.	Tang.	
600–750	330	18	14	175–215
650–800	355	17	13	190–235
700–850	380	16	12	205–245
750–900	405	15	11	215–260
800–950	430	14	10	235–275
Intermediate values may be obtained by interpolation.				

Table 5.4.3 Mechanical properties for acceptance purposes: alloy steel forgings for crankshafts – Quenched and tempered

Tensile strength N/mm²	Yield stress N/mm² minimum	Elongation on $5{,}65\sqrt{S_o}$ % minimum		Hardness Brinell
		Long.	Tang.	
600–750	420	18	14	175–215
650–800	450	17	13	190–235
700–850	380	16	12	205–245
750–900	530	15	11	215–260
800–950	590	14	10	235–275
850–1000	640	13	9	245–290
900–1100	690	13	9	260–320
950–1150	750	12	8	275–340
1000–1200	810	12	8	290–365
Intermediate values may be obtained by interpolation.				

4.5.7 Forgings may be supplied to any specified minimum tensile strength selected within the general limits detailed in Tables 5.4.1 to 5.4.3.

4.5.8 The results of all tensile tests are to comply with the requirements of Table 5.4.1, 5.4.2 or 5.4.3 appropriate to the specified minimum tensile strength.

4.5.9 Where more than one tensile test is taken from a forging, the variation in tensile strength is not to exceed the following:

Specified minimum tensile strength N/mm²	Difference in tensile strength N/mm²
<600	70
≥600 <900	100
≥900	120

4.5.10 For small crankshaft forgings which have been batch tested, the hardness values are to be not less than those given in Tables 5.4.1 to 5.4.3, as appropriate. The variation in hardness in each batch is to comply with the following:

Specified minimum tensile strength (N/mm²)	Difference in hardness (Brinell number)
<600	not more than 25
≥600 <900	not more than 35
≥900	not more than 42

4.6 Non-destructive examination

4.6.1 Magnetic particle or dye penetrant testing as detailed in 1.8.5 and 2.5 is to be carried out on all forgings for crankshafts. Where applicable, this is to include all surfaces which have been flame-cut, but not subsequently machined during manufacture. Particular attention is to be given to the testing of the pins, journals and associated fillet radii of solid forged crankshafts and to the pins and fillet radii of combined web and pin forgings. The extent of testing is shown in Fig. 5.4.3.

4.6.2 The manufacturer is to carry out an ultrasonic examination of all forgings as detailed in 1.8.8 and 2.5, except that for closed-die forgings this examination may, subject to approval, be confined to the initial production and to subsequent occasional checks. The extent of ultrasonic testing is shown in Fig. 5.4.4.

4.6.3 Surface inspection acceptance criteria are to be in accordance with 2.5 and with Table 5.4.4. Other acceptance criteria may be applied, providing they meet these minimum criteria, and is to the satisfaction of the Surveyor.

4.6.4 Ultrasonic acceptance criteria are shown in Table 5.4.5. Other acceptance criteria may be applied, providing they meet these minimum criteria, and is to the satisfaction of the Surveyor.

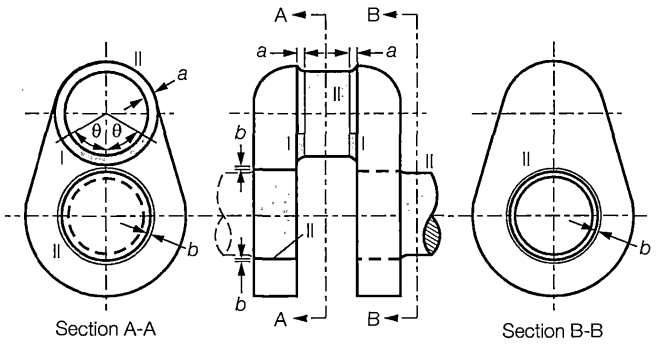
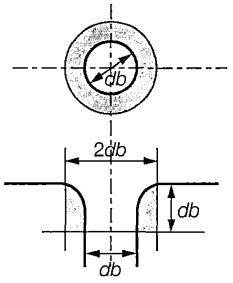
(a) Soild crankshaft



(b) Semi built-up crankshaft

NOTES

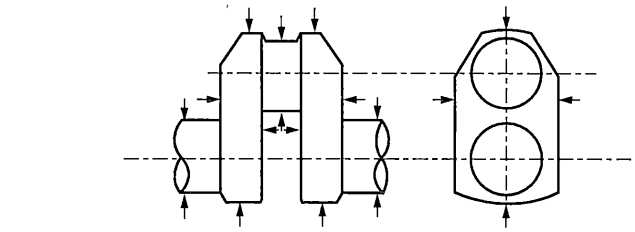
1. Where the crankpin or journal has oil holes, the circumferential surfaces of the oil are to be treated as Zone I, (*see* the figure on the right)
2. In the above figures:
   θ = 60°
   a = 1,5*r*
   b = 0,05*d* (: circumferential surfaces of shrinkage fit)
   where
   r : fillet radius
   d : journal diameter
3. Identification of the Zones:
   : Zone I
   : Zone II

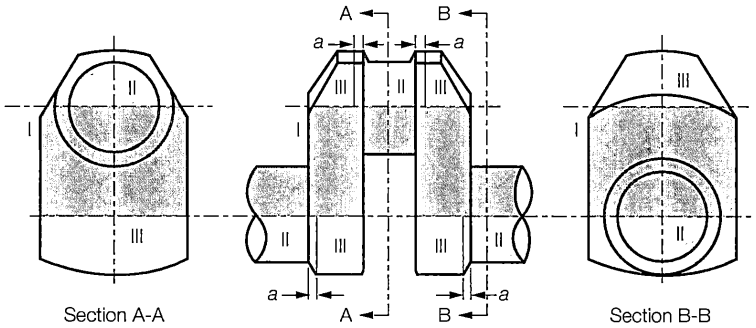


db: Oil hole bore diameter

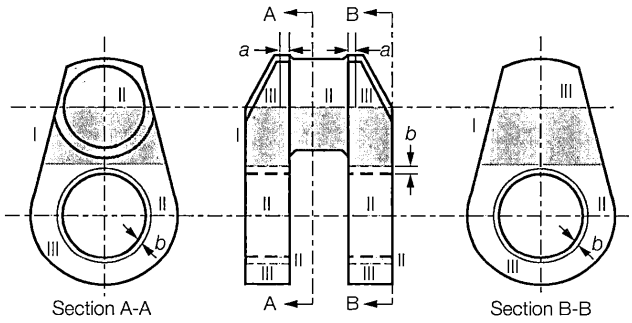
Fig. 5.4.3 Zones for magnetic particle/dye penetrant testing on crankshafts

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.





(a) Solid crankshaft



(b) Semi built-up crankshaft

NOTES

1. In the above figures:
   a = 0,1d or 25 mm, whichever is greater
   b = 0,05d or 25 mm, whichever is greater (: circumstances of shrinkage fit)
   where
   d : pin or journal diameter
2. The mid third area of crank pins and/or journals within a raduis of 0,25d between the webs may generally be coordinated to Zone II
3. Identification of the Zones:
   : Zone I
   : Zone II
   : Zone III

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 5.4.4 Surface inspection acceptance for crankshaft forgings – Allowable number and size of indications in a reference area of 225 cm²

Inspection zone	Maximum number of indication	Type of indication	Maximum number each type	Maximum dimension of single indication, mm
I Critical fillet area	0	Linear Non-linear Aligned	0 0 0	— — —
II Important fillet area	3	Linear Non-linear Aligned	0 3 0	— 3,0 —
III Journal surfaces	3	Linear Non-linear Aligned	0 3 0	— 5,0 —

Table 5.4.5 Ultrasonic acceptance criteria for crankshafts

Type of forging	Zone	Allowable disc shape according to Distance Gain Size (DGS), mm	Allowable length of indication, mm	Allowable distance between two indications, *see* Note, mm
Crank shaft	I II III	$d \leq 2,0$ $d \leq 3,0$ $d \leq 4,0$	— ≤10 ≤15	— ≥20 ≥20
NOTE For accumulations of two or more isolated indications which are subjected to registration, the minimum distance between two neighbouring indications is to be at least the length of the larger indication. This applies to the distance in axial direction as to the distance in depth. Isolated indications with less distance are to be determined as one single indication.				

■ *Section 5*
Forgings for gearing

5.1 Scope

5.1.1 Provision is made in this Section for carbon-manganese and alloy steel forgings intended for use in the construction of gearing for main propulsion and for driving electric generators.

5.1.2 Gear wheel and rim forgings with a specified minimum tensile strength not exceeding 760 N/mm² (760–910 N/mm² acceptance range) may be made in carbon-manganese steel. Gear wheel or rim forgings where the specified minimum tensile strength is in excess of 760 N/mm², and all pinion or pinion sleeve forgings, are to be made in a suitable alloy steel. Specifications for alloy steel components and for quill shafts, giving chemical composition, heat treatment and mechanical properties, are to be submitted for approval.

5.1.3 Forgings for flexible couplings, quill shafts and gear wheel shafts are to comply with the requirements of Section 3.

5.1.4 Manufacturers' test certificates for forgings may be accepted where the transmitted power does not exceed 220 kW (300 shp) for main propulsion and 100 kW (150 shp) for auxiliary drives.

5.2 Manufacture

5.2.1 All forgings are to be made with sufficient material to allow an adequate machining allowance on all surfaces for the removal of unsound or decarburised material.

5.2.2 The hardenability of the forged material is to be checked at random intervals using an end quench test complying with a National or International Standard.

5.2.3 The grain size is to be checked on a random basis in accordance with the testing and reporting procedures of ASTM E 112, or an equivalent National Standard, and is to be within the range 5 to 8.

5.2.4 The microstructure of the hardened case is to be mainly martensite, with a maximum content of 15 per cent of retained austenite.

5.3 Chemical composition

5.3.1 The chemical composition of ladle samples is to comply with 3.2.1. for carbon and carbon-manganese steels and 1.4.3 for alloy steels.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

5.4 Heat treatment

5.4.1 Except as provided in 5.4.4 and 5.4.5, forgings may be either normalised and tempered or quenched and tempered in accordance with the approved specification. The tempering temperature is to be not less than 550°C.

5.4.2 Where forgings are machined prior to heat treatment, the allowance left for final machining is to be sufficient to remove the decarburised surface material, taking into account any bending or distortion which may occur.

5.4.3 When the teeth of a pinion or gear wheel are to be surface hardened, i.e, carburised, nitrided or induction hardened, the proposed specification together with details of the process and practice are to be submitted for approval. For purposes of initial approval, the gear manufacturer is required to demonstrate by test that the surface hardening of the teeth is uniform and of the required depth and that it does not impair the soundness and quality of the steel.

5.4.4 Where induction hardening of nitriding is to be carried out after machining of the gear teeth, the forgings are to be heat treated at an appropriate stage to a condition suitable for this subsequent surface hardening.

5.4.5 Forgings for gears which are to be carburised after final machining are to be supplied in either the fully annealed or the normalised and tempered condition, suitable for subsequent machining and carburising.

5.5 Mechanical tests for through hardened, induction hardened or nitrided forgings

5.5.1 At least one tensile test specimen is to be taken from each forging in carbon or carbon-manganese steel, and at least one tensile test specimen from forgings in alloy steel. Sufficient test material is to be provided for this purpose and the test specimens are to be taken as follows:

(a) For pinion forgings where the finished diameter of the toothed portion exceeds 200 mm, tests are to be taken in a tangential direction and adjacent to the toothed portion (test position B in Fig. 5.5.1). Where the dimensions preclude the preparation of tests from this position, tests in a tangential direction are to be taken from the end of the journal (test position C in Fig. 5.5.1). If, however, the journal diameter is 200 mm or less, tests are to be taken in a longitudinal direction (test position A in Fig. 5.5.1). Where the finished length of the toothed portion exceeds 1250 mm, tests are to be taken from each end.

(b) For small pinion forgings where the finished diameter of the toothed portion is 200 mm or less, tests are to be taken in a longitudinal direction (test position A in Fig. 5.5.1).

(c) For gear wheel forgings, tests are to be taken in a tangential direction (from one of the test positions B in Fig. 5.5.2).

(d) For gear wheel rim forgings, tests are to be taken in a tangential direction (from one of the test positions A in Fig. 5.5.3). Where the finished diameter exceeds 2500 mm or the mass (as heat treated but excluding test material) exceeds 3 tonnes, tests are to be taken from two diametrically opposite positions (test positions A in Fig. 5.5.3).

(e) For pinion sleeve forgings, tests are to be taken in a tangential direction (from one of the test positions C in Fig. 5.5.4). Where the finished length exceeds 1250 mm, tests are to be taken from each end.

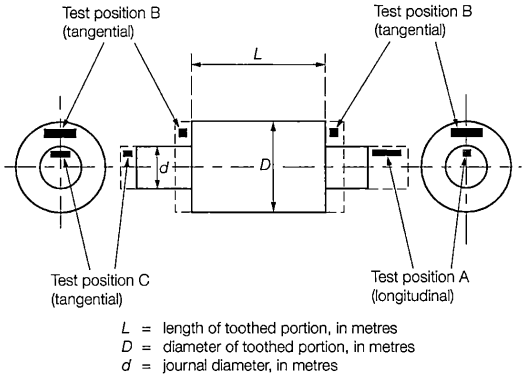

Fig. 5.5.1 Test positions for forgings for gearing

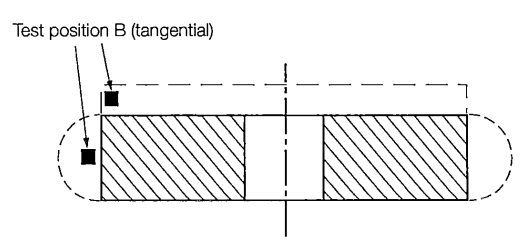

Fig. 5.5.2 Test position B

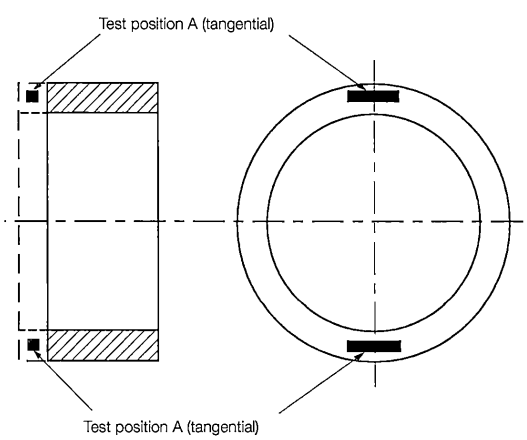

Fig. 5.5.3 Test position A

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

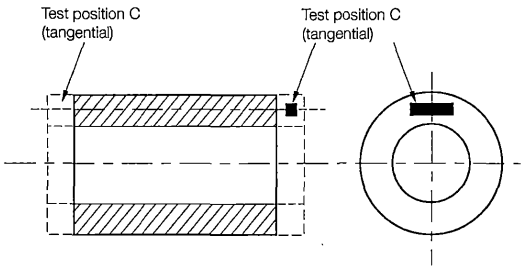

Fig. 5.5.4 Test position C

5.5.2 As an alternative to 5.5.1, small forgings may be batch tested in accordance with 1.6.4 provided that, in addition, hardness tests are carried out on each forging.

5.5.3 Tables 5.5.1 to 5.5.3 give the minimum requirements for yield stress and elongation corresponding to different strength levels, but it is not intended that these should necessarily be regarded as specific grades. The strength levels have been given in multiples of 40 N/mm^2, or 50 N/mm^2 in the case of alloy steels, to facilitate interpolation for intermediate values of specified minimum tensile strength.

Table 5.5.1 Mechanical properties for acceptance purposes: carbon-manganese steels for gear wheel and rim forgings

Tensile strength N/mm^2 (*see* Note)	Yield stress N/mm^2 minimum	Elongation on $5{,}65\sqrt{S_o}$ % minimum		Hardness Brinell
		Rims	Wheels	
400–520	200	26	22	110–150
440–560	220	24	21	125–160
480–600	240	22	19	135–175
520–640	260	21	18	150–185
560–680	280	20	17	160–200
600–750	300	18	15	175–215
640–790	320	17	14	185–230
680–830	340	16	14	200–240
720–870	360	15	13	210–250
760– 910	380	14	12	225–265
Intermediate values may be obtained by interpolation.				
NOTE When the specified minimum tensile strength exceeds 700 N/mm^2 forgings are to be supplied only in the quenched and tempered condition.				

5.5.4 Forgings may be supplied to any specified minimum tensile strength selected within the general limits detailed in Tables 5.5.1 to 5.5.3.

5.5.5 The results of all tensile tests are to comply with the requirements of Table 5.5.1, 5.5.2 or 5.5.3, appropriate to the specified minimum tensile strength. Unless otherwise agreed, the specified minimum tensile strength is to be not less than 800 N/mm^2 (800–950 N/mm^2 acceptance range) for induction hardened or nitrided gear forgings.

Table 5.5.2 Mechanical properties for acceptance purposes: alloy steel gear wheel and rim forgings – Normalised and tempered

Tensile strength N/mm^2	Yield stress N/mm^2 minimum	Elongation on $5{,}65\sqrt{S_o}$ % minimum		Hardness Brinell
		Rims	Wheels	
600–750	330	18	16	175–215
650–800	355	17	15	190–235
700–850	380	16	14	205–245
750–900	405	15	13	215–260
800–950	430	14	12	235–275
850–1000	455	13	11	245–290
Intermediate values may be obtained by interpolation.				

Table 5.5.3 Mechanical properties for acceptance purposes: alloy steel gear forgings – Quenched and tempered

Tensile strength N/mm^2 (*see* Notes 1 and 2)	Yield stress N/mm^2 minimum (*see* Note 2)	Elongation on $5{,}65\sqrt{S_o}$ % minimum			Hardness Brinell
		A	B	C	
600–750	420	18	16	14	175–215
650–800	450	17	15	13	190–235
700–850	480	16	14	12	205–245
750–900	530	15	13	11	215–260
800–950	590	14	12	10	235–275
850–1000	640	13	11	9	245–290
900–1050	690	13	11	9	260–310
950–1100	750	12	10	8	275–330
1000–1150	810	12	10	8	290–340
1050–1200	870	11	9	7	310–365
Column A is applicable to tests from gear rims and to longitudinal tests from pinions. Column B is applicable to tests from gear wheels and to tangential tests from pinions. Column C is applicable to tests from pinion sleeves.					
Intermediate values may be obtained by interpolation.					
NOTES 1. For gear wheel and rim forgings the specified minimum tensile strength is not to exceed 850 N/mm^2. 2. *For carburised gear forgings the requirements for minimum* yield stress and maximum tensile strength are not applicable.					

5.5.6 Where more than one tensile test is taken from a forging, the variation in tensile strength is not to exceed the following:

Specified minimum tensile strength N/mm^2	Difference in tensile strength N/mm^2
<600	70
≥600 <900	100
≥900	120

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

5.5.7 Hardness tests are to be carried out on all forgings after completion of heat treatment and prior to machining the gear teeth. The hardness is to be determined at four positions equally spaced around the circumference of the surface where teeth will subsequently be cut. Where the finished diameter of the toothed portion exceeds 2500 mm, the number of test positions is to be increased to eight. Where the width of a gear wheel rim forging exceeds 1250 mm, the hardness is to be determined at eight positions at each end of the forging.

5.5.8 For small gear forgings which are batch tested, at least one hardness test is to be carried out on each forging.

5.5.9 The results of all hardness tests are to comply with the appropriate requirements of Tables 5.5.1 to 5.5.3. The difference between the highest and lowest values on any one forging is not to exceed the following:

Specified minimum tensile strength (N/mm^2)	Difference in hardness (Brinell number)
<600	25
≥600 <900	35
≥900	42

5.5.10 On nitrided or induction hardened components, hardness tests are also to be made on the teeth when surface hardening and grinding have been completed. The results are to comply with the approved specification.

5.6 Mechanical tests for carburised forgings

5.6.1 Sufficient test material is to be provided for preliminary tests at the forge and for final tests after completion of carburising. For this purpose, duplicate sets of test material are to be taken from positions as detailed in 5.5.1, except that, irrespective of the dimensions or mass of the forging, tests are required from one position only, and in the case of forgings with integral journals are to be cut in a longitudinal direction. The test material which is to be used for measurements of case depth, hardness, grain size and residual austenite as well as mechanical properties is to be machined to a coupon of diameter of $\frac{D}{4}$ or 30 mm, whichever is less, where D is the finished diameter of the toothed portion.

5.6.2 For small forgings, where a system of batch testing is adopted, the test material may be prepared from surplus steel from the same cast provided that the forging reduction approximates to that of the actual gear forgings. The test samples are to be correctly identified and heat treated with the forgings they represent.

5.6.3 For preliminary tests at the forge, one set of test material is to be given a blank carburising and heat treatment cycle simulating that which will be subsequently applied to the forgings.

5.6.4 For final acceptance tests, the second set of test material is to be blank carburised and heat treated together with the forgings which it represents.

5.6.5 At the discretion of the forgemaster or gear manufacturer, test samples of larger cross-section than in 5.6.1 may be either carburised or blank carburised, but these are to be machined to the required diameter prior to the final quenching and stress relieving heat treatment.

5.6.6 At least one tensile specimen is to be prepared from each sample of test material.

5.6.7 Unless otherwise agreed, the specified minimum tensile strength is to be not less than 750 N/mm^2, and the results of all tensile tests are to comply with the requirements given in Table 5.5.3.

5.6.8 Where it is proposed to adopt alternatives to the requirements of 5.6.1 to 5.6.7, full details are to be submitted to the Surveyor for consideration.

5.7 Non-destructive examination

5.7.1 Magnetic particle or liquid penetrant testing is to be carried out on the teeth of all surface hardened forgings. This examination may also be requested on the finished machined teeth of through hardened gear forgings.

5.7.2 The manufacturer is to carry out an ultrasonic examination of all forgings where the finished diameter of the surfaces, where teeth will be cut, is in excess of 200 mm, and is to provide the Surveyor with a signed statement that such inspection has not revealed any significant internal defects.

5.7.3 On gear forgings where the teeth have been surface hardened, additional test pieces may be required to be processed with the forgings and subsequently sectioned to determine the depth of the hardened zone. These tests are to be carried out at the discretion of the Surveyor, and for induction or carburised gearing the depth of the hardened zone is to be in accordance with the approved specification. For nitrided gearing, the full depth of the hardened zone, (i.e. depth to core hardness), is to be not less than 0,5 mm and the hardness at a depth of 0,25 mm is to be not less than 500 HV.

■ *Section 6* Forgings for turbines

6.1 Scope

6.1.1 Provision is made in this Section for ferritic steel forgings for turbine rotors, discs and spindles, turbine-driven generator rotors and compressor rotors.

6.1.2 Plans for rotor forgings are to state whether the rotor is intended for propulsion or auxiliary machinery and the shaft power of auxiliary turbines. In the case of a rotor which is to be tested for thermal stability, the maximum operating temperature and the proposed test temperature are also to be stated.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

6.1.3 Specifications of alloy steel forgings giving the proposed chemical composition, heat treatment and mechanical properties are to be submitted for approval with the plans of the components.

6.1.4 Where it is proposed to use rotors of welded construction, the compositions of the steels for the forgings are to be submitted for special consideration, together with details of the proposed welding procedure. Welding procedure tests may be required.

6.2 Manufacture

6.2.1 Forgings are to be manufactured in accordance with the requirements of Section 1, except that for rotors the forging reduction is to be not less than 2,5 to 1. Where an upsetting operation is included in the manufacturing procedure, the above requirement applies to the cross-sectional area of the upset bloom and not to that of the ingot.

6.3 Chemical composition

6.3.1 The chemical composition of ladle samples is to comply with 3.2.1 for carbon and carbon-manganese steels and 1.4.3 for alloy steels.

6.4 Heat treatment

6.4.1 Forgings are to be supplied in the heat treated condition, and the thermal treatment at all stages is to be such as to avoid the formation of hair-line cracks. At a suitable stage of manufacture, the forgings are to be reheated above the upper critical point to refine the grain, cooled in an approved manner and then tempered to produce the desired mechanical properties.

6.4.2 Where forgings receive their main heat treatment before machining, they are to be stress relieved after rough machining. Forgings which are heat treated in the rough machined condition need not be stress relieved provided that they have been slowly cooled from the tempering temperature.

6.4.3 The tempering and stress relieving temperatures are to be not less than 550°C for carbon and carbon-manganese steels, and not less than 600°C for alloy steels. The holding times and subsequent cooling rates are to be such that the forging in its final condition is free from harmful residual stresses.

6.4.4 Details of the proposed heat treatment for rotors of welded construction are to be submitted for approval.

6.5 Mechanical tests

6.5.1 At least one tensile test specimen, cut in a longitudinal direction, is to be taken from each rotor forging. For forgings exceeding both 3 tonnes in mass and 2000 mm in length, tests are to be taken from each end.

6.5.2 For rotor forgings of all main propulsion machinery and of auxiliary turbines exceeding 1100 kW, tangential and, where the dimensions permit, radial tensile tests are to be taken from the end of the body corresponding to the top end of the ingot, *see* Fig. 5.6.1.

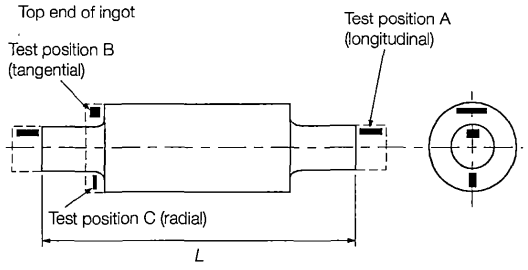

Fig. 5.6.1 Test positions for turbine rotor forgings

6.5.3 For each turbine disc, at least one tensile test specimen is to be cut in a tangential direction from material at the hub, *see* Fig. 5.6.2.

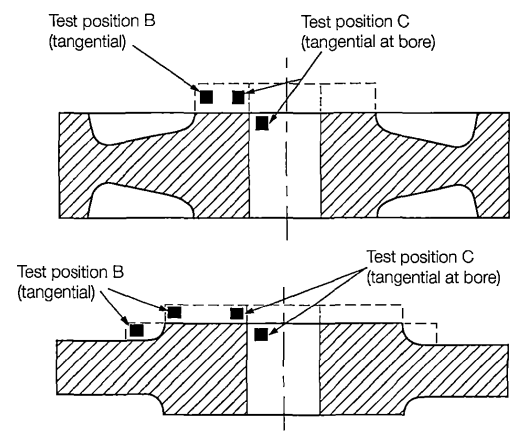

Fig. 5.6.2 Test positions for turbine disc forgings

6.5.4 For the tests required by 6.5.1 to 6.5.3, sufficient test material is to be left on each forging and is not to be removed until all heat treatment, including stress relieving, has been completed. In this connection, a thermal stability test does not form part of the heat treatment of a turbine forging. Any excess test material is not to be completely severed from a forging until all the mechanical tests have been completed with satisfactory results.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

6.5.5 Tables 5.6.1 and 5.6.2 give the minimum requirements for yield stress, elongation and reduction of area corresponding to different strength levels, but it is not intended that these should necessarily be regarded as specific grades. The strength levels have been given in multiples of 40 N/mm^2, or 50 N/mm^2 for alloy steels, to facilitate interpolation for intermediate values of specified minimum tensile strength.

Table 5.6.1 Mechanical properties for acceptance purposes: carbon-manganese steel forgings for turbines – Normalised and tempered

Tensile strength N/mm^2	Yield stress N/mm^2 minimum	Elongation $5{,}65\sqrt{S_o}$ % minimum			Reduction of area % minimum		
		A	B	C	A	B	C
400–520	200	26	22	18	50	40	35
440–560	220	24	21	17	50	40	35
480–600	240	22	19	15	45	35	30
520–640	260	21	18	14	45	35	30
560–680	280	20	17	13	40	30	25
600–720	300	18	15	12	40	30	25

NOTES
Columns A are applicable to longitudinal tests from rotor and spindle forgings.
Columns B are applicable to tangential tests from rotor forgings.
Columns C are applicable to radial tests from rotor forgings.
Intermediate values may be obtained by interpolation.

6.5.6 Forgings may be supplied to any specified minimum tensile strength selected within the general limits detailed in Table 5.6.1 or Table 5.6.2.

6.5.7 The results of all tensile tests are to comply with the requirements of Table 5.6.1 or Table 5.6.2 appropriate to the specified minimum tensile strength. For monobloc rotor forgings, the specified minimum tensile strength is not to exceed 800 N/mm^2.

6.6 Non-destructive examination

6.6.1 The end faces of the body of rotor forgings and the end faces of the boss and the bore surface of each turbine disc are to be machined to a fine smooth finish for visual and magnetic particle examination.

6.6.2 The manufacturer is to carry out an ultrasonic examination of each forging and is to provide the Surveyor with a signed statement that such inspection has not revealed any significant internal defects.

6.6.3 Rotor forgings for propulsion machinery and for auxiliary turbines exceeding 1100 kW are to be hollow bored for internal examination. The surface of the bore is to have a fine smooth finish and is to be examined by means of an optical instrument of suitable magnification. Where the bore size permits, magnetic particle examination is also to be carried out. These examinations are to be confirmed by the Surveyor. Alternatively, an approved method of ultrasonic examination may be accepted instead of hollow boring. Details of the proposed method of ultrasonic examination are to be submitted for special consideration.

Table 5.6.2 Mechanical properties for acceptance purposes: alloy steel forgings for turbines – Quenched and tempered or normalised and tempered

Tensile strength N/mm^2 (*see* Note)	Yield stress N/mm^2 minimum Normalised and tempered	Yield stress N/mm^2 minimum Quenched and tempered	Elongation on $5{,}65\sqrt{S_o}$ % minimum			Reduction of area %minimum

6.7 Thermal stability tests

6.7.1 Thermal stability tests after heat treatment and rough machining of the turbine rotors, referred to in the relevant Rules dealing with design and construction, are to be undertaken in properly constructed furnaces, using accurate and reliable measuring equipment. Each test is to be carried out in accordance with the following recommended procedure:

(a) Five bands are to be machined concentric with the axis of rotation. Two of these are to be reference bands and are to be positioned at or near the locations of the bearings. The remaining three bands are to be test bands located one as near as possible to the mid-length, and the other two near each end of the body. Where the length of a rotor is such that five bands cannot be provided, alternative proposals are to be submitted to the Surveyor for his approval.

(b) Four positions, 90° apart, are to be stamped A, B, C and D on the coupling end of the rotor.

(c) The whole of the body, and as much of the shaft at either end as will include the positions of the glands, is to be enclosed in the furnace. In the case of a rotor having an overhung astern wheel, the astern wheel is also to be enclosed in the furnace during the first test.

(d) The rotor is to be rotated at a uniform and very low speed.

(e) The deflections at all bands are to be recorded at the A, B, C and D positions. Initial cold readings are to be taken prior to heating.

(f) The rotor is to be heated uniformly and slowly. Temperatures are to be recorded continuously at the surface of the rotor and, if practicable, in the bore at the mid-length of the body. In no circumstances is the surface temperature to exceed the temperature at which the rotor was tempered. During heating, the rate of rise of temperature is to be such as to avoid excessive temperature gradients in the rotor.

(g) The maximum or holding temperature is to be not less than 28°C above the maximum operating temperature of the rotor. For the purposes of the test, the holding period is to start when the rotor has attained a uniform and specified temperature. The rotor is to be held under the specified temperature conditions until not less than three consecutive hourly readings of deflections show the radial eccentricity to be constant within 0,006 mm on all test bands.

(h) The turbine rotor is to be rotated during cooling until the temperature is not more than 100°C. The rate of cooling is to be such as to avoid excessive temperature gradients in the rotor.

(j) Final cold readings are to be taken.

6.7.2 The movements of the axis of the rotor in relation to the reference bands are to be determined from polar plots of the deflection readings. The radial movement of the shaft axis, as determined by the difference between the final hot and the final cold movements, is not to exceed 0,025 mm on any one band. As verification that test equipment and conditions are satisfactory, it is required that similar determinations of differences between initial cold and final cold movements do not exceed 0,025 mm on any one band.

6.7.3 If the results of the test on a rotor fail to meet either or both of the requirements in 6.7.2, the test may be repeated if requested by the maker and agreed by the Surveyor. In the case of a rotor failing to meet the requirements of a thermal stability test, the rotor is deemed unacceptable. Proposals for the rectification of thermal instability of a rough machined rotor are to be submitted for special consideration.

■ *Section 7*
Forgings for boilers, pressure vessels and piping systems

7.1 Scope

7.1.1 Provision is made in this Section for carbon-manganese and low alloy steel forgings intended for use in the construction of boilers, pressure vessels and piping systems where the design temperature is not lower than 0°C.

7.1.2 In addition to specifying mechanical properties at ambient temperature for the purposes of acceptance testing, these requirements give details of appropriate mechanical properties at elevated temperatures to be used for design purposes.

7.1.3 Forgings used in the construction of equipment for the containment of liquefied gases are to comply with the requirements of Section 8, except for those used in piping systems, where the design temperature is not lower than 0°C. Forgings for other pressure vessels and piping systems, where the use of steels with guaranteed impact properties at low temperatures is required, are also to comply with Section 8.

7.2 Chemical composition

7.2.1 The chemical composition of ladle samples is to comply with the appropriate requirements of Table 5.7.1.

7.3 Heat treatment

7.3.1 Carbon-manganese steel forgings are to be normalised, normalised and tempered or quenched and tempered.

7.3.2 Alloy steel forgings are to be normalised and tempered or quenched and tempered.

7.3.3 No forging is to be fully heat treated more than twice.

7.4 Mechanical tests

7.4.1 Except as provided in 7.4.2 and 7.4.4, at least one tensile test is to be taken from each forging and, where the dimensions and shape allow, the test specimen is to be cut in the longitudinal direction.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 5.7.1 Chemical composition

Type of steel	Tensile strength N/mm²	Chemical composition of ladle samples %							
		C max.	Si	Mn	P max.	S max.	Al	Residual elements	
Carbon-manganese	410–530	0,20	0,10–0,40	0,50–1,20	0,030	0,025	(*See* Notes 1 and 3)	Ni 0,40 max. Cr 0,25 max. Mo 0,10 max. Cu 0,30 max. Total 0,80 max.	
	460–580	0,23		0,80–1,40					
	490–610	0,25		0,90–1,70					
								Cr	Mo
Alloy steel 1Cr½Mo	440–590	0,18	0,15–0,40	0,40–0,70	0,030	0,025	0,020 max. (*See* Note 2)	0,85–1,15	0,45–0,65
2¼ Cr1Mo	490–640	0,15						2,0–2,5	0,90–1,20

NOTES
1. Fine grained steels are to contain:
   aluminium (acid soluble) 0,015% min. or
   aluminium (total) 0,018% min.
2. For alloy steels, aluminium (acid soluble) 0,020% max.
   The determination of the aluminium (total) content is acceptable provided the above value is not exceeded.
3. Niobium may be used as a grain refiner in place of aluminium, in which case the content is to be in the range 0,01% to 0,06%.

7.4.2 On seamless drums and headers which are initially forged with open ends, test material is to be provided at each end of each forging. Where forged with one solid end, test material is to be provided at the open end only. Except where the ends are to be subsequently closed by forging, the test material is not to be removed until heat treatment has been completed. Where the ends are to be closed, rings of test material are to be cut off prior to the closing operation and are to be heat treated with the finished forging. In all cases, the test specimens are to be cut in the circumferential direction.

7.4.3 Unless otherwise agreed, tensile test specimens are to be taken with their axis at approximately 12,5 mm below the surface of the forging.

7.4.4 Small forgings may be batch tested in accordance with 1.6.4 provided that hardness tests are carried out on each forging. In such cases, the mass of each forging is not to exceed 1 tonne and that of the batch is not to exceed 10 tonnes and the hardness values are to accord with Table 5.7.2.

Table 5.7.2 Mechanical properties for acceptance purposes

Type of steel	Diameter or equivalent thickness mm	Yield stress N/mm²	Tensile strength N/mm²	Elongation on $5{,}65\sqrt{S_o}$ % minimum	Hardness Brinell
Carbon-manganese not specifically fine grained	≤100	215	410–530	20	110–155
	>100 ≤500	205			
	≤100	245	460–580	18	130–170
	>100	235			
	≤100	265	490–610	16	140–180
	>100	255			
Carbon-manganese, fine grained	≤100	235	410–530	20	110–155
	>100 ≤250	220			
	≤100	275	460–580	18	130–170
	>100 ≤250	255			
	≤100	305	490–610	16	140–180
	>100 ≤250	280			
Alloy steel 1Cr½Mo	–	275	440–590	19	110–160
2¼Cr1Mo	–	275	490–640	18	140–185

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

7.4.5 If required by the Surveyors or by the Fabricators, test material may be given a simulated stress relieving heat treatment prior to the preparation of the test specimens. This has to be stated on the order, together with agreed details of the simulated heat treatment and the mechanical properties which can be expected.

7.4.6 Except as provided in 7.4.7, the results of all tensile tests are to comply with the requirements given in Table 5.7.2 appropriate to the specified minimum tensile strength.

7.4.7 Where tests are taken at a depth greater than 12,5 mm from the surface or where they are taken in a transverse direction, the mechanical properties which can be expected are to be agreed.

7.4.8 On seamless drums and headers where tests are taken from each end, the variation in tensile strength is not to exceed 70 N/mm^2.

7.4.9 For small batch-tested forgings, the hardness values are to comply with the requirements of Table 5.7.2 appropriate to the specified minimum tensile strength. If forgings of more than one thickness are to be supplied from one cast, then the test is to be made on the thickest forging.

7.5 Non-destructive examination

7.5.1 Non-destructive testing is to be carried out in accordance with the requirements of the approved forging drawing and specification, or as otherwise agreed between the manufacturer, purchaser and Surveyor.

7.6 Pressure tests

7.6.1 Where applicable, pressure tests are to be carried out in accordance with the requirements of the relevant Rules.

7.7 Mechanical properties for design purposes

7.7.1 Nominal values for the minimum lower yield or 0,2 per cent proof stress at temperatures of 50°C and higher are given in Table 5.7.3. These values are intended for design purposes only, and verification is not required except for materials complying with National or proprietary specifications where the elevated temperature properties used for design purposes are higher than those given in Table 5.7.3.

Table 5.7.3 Mechanical properties for design purposes

Type of steel	Diameter or equivalent thickness mm	Tensile strength N/mm^2	Nominal minimum lower yield or 0,2% proof stress N/mm^2											
			Temperature °C

7.7.2 Where verification is required, at least one tensile test at the proposed design or other agreed temperature is to be made on each forging or each batch of forgings. The test specimen is to be taken from material adjacent to that used for tests at ambient temperature, and the test procedure is to be in accordance with the requirements of Chapter 2. The results of all tests are to comply with the requirements of the National or proprietary specification.

7.7.3 Values for the estimated average stress to rupture in 100 000 hours are given in Table 5.7.4 and may be used for design purposes.

Section 8
Ferritic steel forgings for low temperature service

8.1 Scope

8.1.1 The requirements for carbon-manganese and nickel steels suitable for low temperature service are detailed in this Section. They are applicable to all forgings used for the construction of cargo tanks, storage tanks and process pressure vessels for liquefied gases and, where the design temperature is less than 0°C, to forgings for the piping systems.

8.1.2 The requirements are also applicable to forgings for other pressure vessels and pressure piping systems where the use of steels with guaranteed impact properties at low temperatures is required.

8.1.3 In all cases, details of the proposed chemical composition, heat treatment and mechanical properties are to be submitted for approval.

8.1.4 In addition to the steels in this Section, the austenitic stainless steels detailed in Section 9 may also be used for low temperature applications.

8.2 Chemical composition

8.2.1 The chemical composition of ladle samples is, in general, to comply with the requirements given in Table 5.8.1.

8.3 Heat treatment

8.3.1 Forgings are to be normalised, normalised and tempered or quenched and tempered in accordance with the approved specification.

8.4 Mechanical tests

8.4.1 At least one tensile and three Charpy V-notch impact test specimens are to be taken from each forging or each batch of forgings. Where the dimensions and shape allow, the test specimens are to be cut in a longitudinal direction.

8.4.2 The impact tests are to be carried out at a temperature appropriate to the type of steel and for the proposed application. Where forgings are intended for ships for liquefied gases, the test temperature is to be in accordance with the requirements given in Table 3.6.3 in Chapter 3.

8.4.3 The results of all tensile tests are to comply with the approved specification.

8.4.4 The average energy values for impact tests are also to comply with the approved specification and generally with the requirements of Ch 3,6. One individual value may be less than the required average value provided that it is not less than 70 per cent of this value. *See* Ch 2,1.4 for re-test procedures.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 5.8.1 Chemical composition of ferritic steel forgings

Grade of steel	C %	Si %	Mn %	Ni %	P %	S %	Residual elements %	Grain refiners % Al	Grain refiners % Other
LT–AH (AH40) LT–DH (DH40) LT–EH (EH40)	0,18 max.	0,50 max.	0,90–1,60	0,40 max.	0,035 max.	0,030 max.	Cu 0,35 max. Cr 0,20 max. Mo 0,08 max. Total 0,60 max.		(*See* Note) Nb 0,02 – 0,05 V 0,03 – 0,10 Ti 0,02 max.
LT–FH (FH40)	0,16 max.			0,80 max.		0,025 max.			
1½Ni	0,18 max.	0,10 – 0,35	0,30–1,50	1,30–1,70	0,025 max.	0,020 max.	Cu 0,35 max. Cr 0,25 max. Mo 0,08 max. Total 0,60 max.	Total 0,020 min. Acid soluble 0,015 min.	
3½Ni	0,15 max.		0,30–0,90	3,20–3,80					
5Ni	0,12 max.			4,70–5,30					
9 Ni	0,10 max.			8,50–10,0					

NOTE
The steel is to contain aluminium, niobium, vanadium or other suitable grain refining elements, either singly or in any combination. When used singly, the steel is to contain the specified minimum content of the grain refining element. When used in combination, the specified minimum content of each element is not applicable.

8.5 Non-destructive examination

8.5.1 Non-destructive testing is to be carried out in accordance with the requirements of the approved forging drawing and specification, or as otherwise agreed between the manufacturer, purchaser and Surveyor.

8.6 Pressure tests

8.6.1 When applicable, pressure tests are to be carried out in accordance with the requirements of the relevant Rules.

■ *Section 9*
Austenitic stainless steel forgings

9.1 General

9.1.1 Forgings in austenitic stainless steels are acceptable for use in the construction of cargo tanks, storage tanks and piping systems for chemicals and liquefied gases. They may also be accepted for elevated temperature service in boilers.

9.1.2 Where it is proposed to use forgings in these types of steels, details of the chemical composition, heat treatment and mechanical properties are to be submitted for approval. These are to comply, in general, with the requirements of Ch 3,7 for austenitic steel plates.

9.1.3 Unless otherwise agreed, impact tests are not required for acceptance purposes. Where they are required, tests are to be made on longitudinal specimens at minus 196°C and the minimum average energy requirement is to be 41J.

9.2 Mechanical properties for design purposes

9.2.1 Where austenitic stainless steel forgings are intended for service at elevated temperatures, the nominal values for the minimum one per cent proof stress at temperatures of 100°C and higher given in Table 5.9.1 may be used for design purposes. Verification of these values is not required except for material complying with a National or proprietary specification in which the elevated temperature properties proposed for design purposes are higher than those given in Table 5.9.1.

9.3 Non-destructive examination

9.3.1 Non-destructive examination is to be carried out in accordance with the requirements of the approved forging drawing and specification or as otherwise agreed between the manufacturer, purchaser and Surveyor.

9.4 Intergranular corrosion tests

9.4.1 Where corrosive conditions are anticipated in service, intergranular corrosion tests are required on forgings in Grades 304, 316 and 317. Such tests may not be required for Grades 304L, 316L, 321 and 347.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 5.9.1 Mechanical properties for design purposes: austenitic stainless steels

Grade	Nominal 1% proof stress (N/mm^2) at a temperature of												
	100°C	150°C	200°C	250°C	300°C	350°C	400°C	450°C	500°C	550°C	600°C	650°C	700°C
304L	168	150	137	128	122	116	110	108	106	102	100	96	93
316L	177	161	149	139	133	127	123	119	115	112	110	107	105
316LN	238	208	192	180	172	166	161	157	152	149	144	142	138
321	192	180	172	164	158	152	148	144	140	138	135	130	124
347	204	192	182	172	166	162	159	157	155	153	151	—	—

9.4.2 When an intergranular corrosion test is specified, it is to be carried out in accordance with the procedure given in Ch 2,8.1.

Steel Pipes and Tubes

Section

1 **General requirements**

2 **Seamless pressure pipes**

3 **Welded pressure pipes**

4 **Ferritic steel pressure pipes for low temperature service**

5 **Austenitic stainless steel pressure pipes**

6 **Boiler and superheater tubes**

■ *Section 1* General requirements

1.1 Scope

1.1.1 This Section gives the general requirements for boiler tubes, superheater tubes and pipes intended for use in the construction of boilers, pressure vessels and pressure piping systems.

1.1.2 In addition to specifying mechanical properties for the purpose of acceptance testing, these requirements give details of appropriate mechanical properties at elevated temperatures to be used for design purposes.

1.1.3 Except for pipes for Class III pressure systems (as defined in the relevant Rules), all pipes and tubes are to be manufactured and tested in accordance with the requirements of Chapters 1 and 2, the general requirements of this Section and the appropriate specific requirements given in Sections 2, 3, 4, 5 and 6.

1.1.4 Steels intended for the piping systems for liquefied gases where the design temperature is less than 0°C are to comply with the specific requirements of Section 4 or 5.

1.1.5 As an alternative to 1.1.3 and 1.1.4, pipes or tubes which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Chapter or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of Chapter 1.

1.1.6 At the discretion of the Surveyor, a modified testing procedure may be adopted for small quantities of materials. In such cases, these may be accepted on the manufacturer's declared chemical composition and hardness tests or other evidence of satisfactory properties.

1.1.7 Pipes for Class III pressure systems are to be manufactured and tested in accordance with the requirements of an acceptable National specification. The manufacturer's test certificate will be acceptable and is to be provided for each consignment of material. Forge butt welded pipes are not acceptable for oil fuel systems, heating coils in oil tanks, primary refrigerant systems and other applications where the pressure exceeds 4,0 bar (4,1 kgf/cm^2).

1.2 Manufacture

1.2.1 Pipes for Class I and II pressure systems, boiler and superheater tubes are to be manufactured at works approved by Lloyd's Register (hereinafter referred to as 'LR'). The steel used is to be manufactured and cast in ingot moulds or by an approved continuous casting process as detailed in Ch 3,1.3.

1.2.2 Unless a particular method is requested by the purchaser, pipes and tubes may be manufactured by any of the following methods:

- Hot finished seamless.
- Cold finished seamless.
- Electric resistance or induction welded.
- Cold finished electric resistance or induction welded.
- Electric fusion welded.

1.2.3 Care is to be taken during manufacture that the pipe or tube surfaces coming in contact with any non-ferrous metals or their compounds are not contaminated to such an extent as could prove harmful during subsequent fabrication and operation.

1.3 Quality

1.3.1 All pipes and tubes are to have a workmanlike finish and are to be clean and free from such surface and internal defects as can be established by the specified tests.

1.3.2 All pipes and tubes are to be reasonably straight. The ends are to be cut nominally square with the axis of the pipe or tube, and are to be free from excessive burrs.

1.4 Dimensional tolerances

1.4.1 The tolerances on the wall thickness and diameter of pipes and tubes are to be in accordance with an acceptable National specification.

1.5 Chemical composition

1.5.1 The requirements for the chemical composition of ladle samples and acceptable methods of deoxidation are detailed in subsequent Sections in this Chapter.

1.6 Heat treatment

1.6.1 All pipes and tubes are to be supplied in the condition detailed in the relevant specific requirements.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.7 Test material

1.7.1 Pipes and tubes are to be presented for test in batches. The size of a batch and the number of tests to be performed are dependent on the application.

1.7.2 Where heat treatment has been carried out, a batch is to consist of pipes or tubes of the same size, manufactured from the same types of steel and subjected to the same finishing treatment in a continuous furnace, or heat treated in the same furnace charge in a batch type furnace.

1.7.3 Where no heat treatment has been carried out, a batch is to consist of pipes or tubes of the same size manufactured by the same method from material of the same type of steel.

1.7.4 For pipes for Class I pressure systems and boiler and superheater tubes, at least two per cent of the number of lengths in each batch is to be selected at random for the preparation of tests at ambient temperature.

1.7.5 For pipes for Class II pressure systems, each batch is to contain not more than the number of lengths given in Table 6.1.1. Tests are to be carried out on at least one pipe selected at random from each batch or part thereof.

Table 6.1.1 Batch sizes for pipes for Class II pressure systems

Outside diameter mm	Number in batch
≤323,9	200 pipes as made
>323,9	100 pipes as made

1.8 Dimensions of test specimens and test procedures

1.8.1 The procedures for mechanical tests and the dimensions of the test specimens are to be in accordance with Chapter 2.

1.9 Visual and non-destructive testing

1.9.1 All pipes for Class I and II pressure systems, boiler and superheater tubes, are to be presented for visual examination and verification of dimensions. The manufacturer is to provide adequate lighting conditions to enable an internal and external examination of the pipes and tubes to be carried out.

1.9.2 For welded pipes and tubes, the manufacturer is to employ suitable non-destructive methods for the quality control of the welds. It is preferred that this examination is carried out on a continuous basis.

1.10 Hydraulic test

1.10.1 Each pipe and tube is to be subjected to a hydraulic test at the manufacturer's works.

1.10.2 The hydraulic test pressure is to be determined from the following formula, except that the maximum test pressure need not exceed 140 bar (143 kgf/cm^2):

$$P = \frac{20st}{D} \left(P = \frac{200st}{D}\right)$$

where

P = test pressure, in bar (kgf/cm^2)
D = nominal outside diameter, in mm
t = nominal wall thickness, in mm
s = 80 per cent of the specified minimum yield stress, in N/mm^2 (kgf/mm^2), for ferritic steels and 70 per cent of the specified minimum, 1,0 per cent proof stress, in N/mm^2 (kgf/mm^2), for austenitic steels. These relate to the values specified for acceptance testing at ambient temperature.

1.10.3 The test pressure is to be maintained for sufficient time to permit proof and inspection. Unless otherwise agreed, the manufacturer's certificate of satisfactory hydraulic test will be accepted. Where it is proposed to adopt a test pressure other than that determined as in 1.10.2, the proposal will be subject to special consideration.

1.10.4 Subject to special approval, either an ultrasonic or eddy current test can be accepted in lieu of the hydraulic test.

1.11 Rectification of defects

1.11.1 Surface imperfections may be removed by grinding provided that the thickness of the pipe or tube after dressing is not less than the required minimum thickness. The dressed area is to be blended into the contour of the tube.

1.11.2 By agreement with the Surveyor, the repair of minor defects by welding can be accepted, subject to welding procedure tests which demonstrate acceptable properties appropriate for the grade of pipe to be repaired. Weld procedure tests are to be subjected to the same heat treatment as will be applied to the actual pipes after weld repair.

1.11.3 The repaired area is to be tested by magnetic particle examination, or, for austenitic steels, by liquid penetrant examination on completion of welding, heat treatment and surface grinding.

1.12 Identification

1.12.1 Pipes and tubes are to be clearly marked by the manufacturer in accordance with the requirements of Chapter 1. The following details are to be shown on all materials which have been accepted:

(a) LR or Lloyd's Register.
(b) Manufacturer's name or trade mark.
(c) Identification mark for the specification or grade of steel.
(d) Identification number and/or initials which will enable the full history of the item to be traced.
(e) The personal stamp of the Surveyor responsible for the final inspection.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.12.2 It is recommended that hard stamping be restricted to the end face, but it may be accepted in other positions in accordance with National Standards and practices.

1.13 Certification of materials

1.13.1 Unless a LR certificate is specified in other parts of the Rules, a manufacturer's certificate validated by LR is to be issued, *see* Ch 1,3.1.

1.13.2 The manufacturer is to provide LR with the following information:

(a) Purchaser's name and order number.
(b) If known, the contract number for which the material is intended.
(c) Address to which material is despatched.
(d) Specification or the grade of material.
(e) Description and dimensions.
(f) Identification number and/or initials.
(g) Cast number and chemical composition of ladle samples.
(h) Mechanical test results, and results of the intercrystalline corrosion tests where applicable.
(j) Condition of supply.

1.13.3 As a minimum, the chemical composition stated on the certificate is to include the content of all the elements detailed in the specific requirements. Where rimming steel is supplied, this is to be stated on the certificate.

1.13.4 When steel is not produced at the pipe or tube mill, a certificate is to be supplied by the steelmaker stating the process of manufacture, the cast number and the ladle analysis.

1.13.5 The steel manufacturer's works is to be approved by LR.

■ *Section 2*
Seamless pressure pipes

2.1 Scope

2.1.1 Provision is made in this Section for seamless pressure pipes in carbon, carbon-manganese and low alloy steels.

2.1.2 Where pipes are used for the manufacture of pressure vessel shells and headers, the requirements for forgings in Ch 5,7 are applicable where the wall thickness exceeds 40 mm.

2.2 Manufacture and chemical composition

2.2.1 Pipes are to be manufactured by a seamless process and may be hot or cold finished.

2.2.2 The method of deoxidation and the chemical composition of ladle samples are to comply with the appropriate requirements given in Table 6.2.1.

Table 6.2.1 Chemical composition of seamless pressure pipes

Type of steel	Grade	Method of deoxidation	Chemical composition of ladle samples %						Residual elements							
			C	Si	Mn	S max.	P max.		Ni	Cr	Mo	Cu	Sn	V	Al
Carbon and carbon-manganese	320	Semi-killed or killed	≤0,16	–	0,40–0,70	0,050	0,050	Ni 0,30 max. Cr 0,25 max. Mo 0,10 max. Cu 0,30 max. Total 0,70 max.	0,30 max.	0,70–1,10	0,45 – 0,65	0,25 max.	0,03 max.	—	≤0,020
	360		≤0,17	≤0,35	0,40–0,80	0,045	0,045								
	410	Killed	≤0,21	≤0,35	0,40–1,20	0,045	0,045								
	460		≤0,22	≤0,35	0,80–1,40	0,045	0,045								
	490		≤0,23	≤0,35	0,80–1,50	0,045	0,045								
1Cr½Mo	440	Killed	0,10–0,18	0,10–0,35	0,40–0,70	0,040	0,040		0,30 max.	2,0–2,5	0,90–1,20	0,25 max.	0,03 max.	—	≤0,020

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2.3 Heat treatment

2.3.1 Pipes are to be supplied in the condition given in Table 6.2.3.

2.4 Mechanical tests

2.4.1 All pipes are to be presented in batches as defined in Section 1.

2.4.2 Each pressure pipe selected for test is to be subjected to tensile and flattening or bend tests.

2.4.3 The results of all mechanical tests are to comply with the appropriate requirements given in Table 6.2.2.

2.5 Mechanical properties for design

2.5.1 Values for nominal minimum lower yield or 0,2 per cent proof stress at temperatures of 50°C and higher are given in Table 6.2.4 and are intended for design purposes only. Verification of these values is not required, except for materials complying with National or proprietary specification where the elevated temperature properties used for design are higher than those given in Table 6.2.4.

2.5.2 In such cases, at least one tensile test at the proposed design or other agreed temperature is to be made on each cast. The test specimen is to be taken from material adjacent to that used for tests at ambient temperature and tested in accordance with the procedures given in Chapter 2. If tubes or pipes of more than one thickness are supplied from one cast, the test is to be made on the thickest tube or pipe.

Table 6.2.3 Heat treatment

Type of steel		Condition of supply
Carbon and carbon-manganese		
Hot finished		Hot finished (*see* Note 1) Normalised (*see* Note 2)
Cold finished		Normalised (*see* Note 2)
Alloy steel		
1Cr1/2Mo		Normalised and tempered
2 1/4Cr1Mo	Grade 410	Fully annealed
	Grade 490	Normalised and tempered 650—780°C
	Grade 490	Normalised and tempered 650—750°C
1/2Cr1/2Mo1/4V		Normalised and tempered

NOTES
1. Provided that the finishing temperature is sufficiently high to soften the material.
2. Normalised and tempered at the option of the manufacturer.

2.5.3 As an alternative to 2.5.2, a manufacturer may carry out an agreed comprehensive test program for a stated grade of steel to demonstrate that the specified minimum mechanical properties at elevated temperatures can be consistently obtained. This test program is to be carried out under the supervision of the Surveyors, and the results submitted for assessment and approval. When a manufacturer is approved on this basis, tensile tests at elevated temperatures are not required for acceptance purposes, but at the discretion of the Surveyors occasional check tests of this type may be requested.

2.5.4 Values for the estimated average stress to rupture in 100 000 hours are given in Table 6.2.5 and may be used for design purposes.

Table 6.2.2 Mechanical properties for acceptance purposes: seamless pressure pipes (maximum wall thickness 40 mm), *see* 2.1.2

Type of steel	Grade	Yield stress N/mm²	Tensile strength N/mm²	Elongation on $5{,}65\sqrt{S_o}$ % minimum	Flattening test constant *C*	Bend test diameter of former (*t* = thickness)
Carbon and carbon-manganese	320	195	320—440	25	0,10	4*t*
	360	215	360—480	24	0,10

■ *Section 3*
Welded pressure pipes

3.1 Scope

3.1.1 Provision is made in this Section for welded pressure pipes in carbon, carbon-manganese and low alloy steels.

3.2 Manufacture and chemical composition

3.2.1 Pipes are to be manufactured by the electric resistance or induction welding process and, if required, may be subsequently hot reduced or cold finished.

3.2.2 Where it is proposed to use other welding processes, details of the welding processes and procedures are to be submitted for review.

3.2.3 In all cases, welding procedure tests are required. Test samples are to be subjected to the same heat treatment as the pipe.

3.2.4 The method of deoxidation and the chemical composition of ladle samples are to comply with the appropriate requirements given in Table 6.3.1.

3.3 Heat treatment

3.3.1 Pipes are to be supplied in the heat treated condition given in Table 6.3.3.

3.4 Mechanical tests

3.4.1 All pipes are to be presented in batches as defined in Section 1.

3.4.2 Each pressure pipe selected for test is to be subjected to tensile and flattening or bend tests.

3.4.3 The results of all mechanical tests are to comply with the appropriate requirements given in Table 6.3.2.

3.5 Mechanical properties for design

3.5.1 The mechanical properties at elevated temperature for carbon and carbon-manganese steels in Grades 320 to 460 and 1Cr½Mo steel can be taken from the appropriate Tables in Section 2.

Table 6.3.1 Chemical composition of welded pressure pipes

Type of steel	Grade	Method of deoxidation	Chemical composition of ladle samples %																
			C	Si	Mn	S max.	P max.	Residual elements											
Carbon and carbon-manganese	320	Any method (see Note)	≤0,16	–	0,30–0,70	0,050	0,050	Ni 0,30 max. Cr 0,25 max. Mo 0,10 max. Cu 0,30 max. Total 0,70 max.

	460		≤0,22	≤0,35	0,80–1,40	0,045	0,045												
								Ni		Cr		Mo		Cu		Sn		Al	
1Cr½Mo	440	Killed	0,10–0,18	0,10–0,35	0,40–0,70	0,040	0,040	0,30 max.		0,70–1,10		0,45–0,65		0,25 max.		0,03 max.		≤0,020	

NOTE
For rimming steels, the carbon content may be increased to 0,19% max.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 6.3.2 Mechanical properties for acceptance purposes: welded pressure pipes

Type of steel	Grade	Yield stress N/mm^2	Tensile strength N/mm^2	Elongation on $5{,}65\sqrt{S_o}$ % minimum	Flattening test constant *C*
Carbon and carbon-manganese	320	195	320 – 440	25	0,10
	360	215	360 – 480	24	0,10
	410	235	410 – 530	22	0,08
	460	265	460 – 580	21	0,07
1Cr^1/$_2$Mo	440	275	440 – 590	22	0,07

Table 6.3.3 Heat treatment: welded pressure pipes

Type of steel	Condition of supply
Carbon and carbon-manganese, *see* Note	Normalised (Normalised and tempered at the option of the manufacturer)
1Cr^1/$_2$Mo	Normalised and tempered
NOTE Subject to special approval, electric resistance welded (ERW) pipes and tubes in grades 320 and 360 may be supplied without heat treatment for the following applications: (a) Class 2 piping systems, except for liquefied gases or other low temperature applications. (b) Class 3 piping systems.	

■ *Section 4*
Ferritic steel pressure pipes for low temperature service

4.1 Scope

4.1.1 Provision is made in this Section for carbon, carbon-manganese and nickel pipes intended for use in the piping arrangements for liquefied gases where the design temperature is less than 0°C. These requirements are also applicable for other types of pressure piping systems where the use of steels with guaranteed impact properties at low temperatures is required.

4.2 Manufacture and chemical composition

4.2.1 Carbon and carbon-manganese steel pipes are to be manufactured by a seamless, electric resistance or induction welding process.

4.2.2 Nickel steel pipes are to be manufactured by a seamless process.

4.2.3 Seamless pipes may be hot finished or cold finished. Welded pipes may be as-welded, hot finished or cold finished. The terms 'hot finished', 'cold finished' and 'as-welded' apply to the condition of the pipes before final heat treatment.

4.2.4 The method of deoxidation and the chemical composition of ladle samples are to comply with the appropriate requirements given in Table 6.4.1.

4.3 Heat treatment

4.3.1 Pipes are to be supplied in the condition given in Table 6.4.3.

4.4 Mechanical tests

4.4.1 All pipes are to be presented for test in batches as defined in Section 1 for Class 1 pressure piping systems, but in addition the material in each batch is to be from the same cast.

4.4.2 At least two per cent of the number of lengths in each batch is to be selected at random for the preparation of tests.

4.4.3 Each pressure pipe selected for test is to be subjected to tensile, flattening or bend test at room temperature and, where the wall thickness is 6 mm or greater, an impact test at the test temperature specified in Table 6.4.2.

4.4.4 The impact tests are to consist of a set of three Charpy V-notch test specimens cut in the longitudinal direction with the notch perpendicular to the original surface of the pipe. The dimensions of the test specimens are to be in accordance with the requirements of Chapter 2.

4.4.5 The results of all tensile, flattening and bend tests are to comply with the appropriate values in Table 6.4.2.

4.4.6 The average value for impact test specimens is to comply with the appropriate requirements of Table 6.4.2. One individual value may be less than the required average value provided that it is not less than 70 per cent of this value. *See* Ch 2,1.4.1 for re-test procedures.

■ *Section 5*
Austenitic stainless steel pressure pipes

5.1 Scope

5.1.1 Provision is made in this Section for austenitic stainless steel pipes suitable for use in the construction of the piping systems for chemicals and for liquefied gases where the design temperature is not less than minus 165°C and for bulk chemical tankers.

5.1.2 Austenitic stainless steels are also suitable for service at elevated temperatures. Where such applications are proposed, details of the chemical composition, heat treatment and mechanical properties are to be submitted for consideration and approval.

5.1.3 Where it is intended to supply seamless pipes in the direct quenched condition, a programme of tests for approval is to be carried out under the supervision of the Surveyors, and the results are to be to the satisfaction of LR, *see* Ch 1,2.2.

5.2 Manufacture and chemical composition

5.2.1 Pipes are to be manufactured by a seamless or a continuous automatic electric fusion welding process.

5.2.2 Welding is to be in a longitudinal direction, with or without the addition of filler metal.

5.2.3 The chemical composition of the ladle samples is to comply with the appropriate requirements of Table 6.5.1.

5.3 Heat treatment

5.3.1 Pipes are generally to be supplied by the manufacturer in the solution treated condition over their full length.

5.3.2 Alternatively, seamless pipes may be direct quenched immediately after hot forming, while the temperature of the pipes is not less than the specified minimum solution treatment temperature.

5.4 Mechanical tests

5.4.1 All pipes are to be presented in batches as defined in Section 1 for Class I and II piping systems.

5.4.2 Each pipe selected for test is to be subjected to tensile and flattening or bend tests.

5.4.3 The results of all mechanical tests are to comply with the appropriate requirements given in Table 6.5.2.

Table 6.5.1 Chemical composition

Type of steel	Grade	Chemical composition of ladle sample %								
		C max.	Si	Mn	P max.	S max.	Cr	Mo	Ni	Others
304L	490	0,03	<1,00	<2,00	0,045	0,030	17,0 – 19,0	—	9,0 – 13,0	—
316L	490	0,03	<1,00	<2,00	0,045	0,030	16,0 – 18,5	2,0–3,0	11,0 – 14,5	—
321	510	0,08	<1,00	<2,00	0,045	0,030	17,0 – 19,0	—	9,0 – 13,0	Ti ≥5 x C ≤0,80
347	510	0,08	<1,00	<2,00	0,045	0,030	17,0 – 19,0	—	9,0 – 13,0	Nb ≥10 x C ≤1,00

Table 6.5.2 Mechanical properties for acceptance purposes

Type of steel	Grade	0,2% proof stress N/mm^2 (*see* Note)	1,0% proof stress N/mm^2	Tensile strength N/mm^2	Elongation on $5{,}65\sqrt{S_o}$ % minimum	Flattening test constant *C*	Bend test diameter of former (*t* = thickness)
304L	490	175	205	490 – 690	30	0,09	3*t*
316L	490	185	215	490 – 690	30	0,09	3*t*
321	510	195	235	510 – 710	30	0,09	3*t*
347	510	205	245	510 – 710	30	0,09	3*t*

NOTE
The 0,2% proof stress values given for information purposes and unless otherwise agreed are not required to be verified by test.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

5.5 Intergranular corrosion tests

5.5.1 For materials used for piping systems for chemicals, intercrystalline corrosion tests are to be carried out on one per cent of the number of pipes in each batch, with a minimum of one pipe.

5.5.2 For pipes with an outside diameter not exceeding 40 mm, the test specimens are to consist of a full cross-section. For larger pipes, the test specimens are to be cut as circumferential strips of full wall thickness and having a width of not less than 12,5 mm. In both cases, the total surface area is to be between 15 and 35 cm^2.

5.5.3 Unless otherwise agreed or required for a particular chemical cargo, the testing procedure is to be in accordance with Ch 2,8.

5.5.4 After immersion, the full cross-section test specimens are to be subjected to a flattening test in accordance with the requirements of Chapter 2. The strip test specimens are to be subjected to a bend test through 90° over a mandrel of diameter equal to twice the thickness of the test specimen.

5.6 Fabricated pipework

5.6.1 Fabricated pipework is to be produced from material manufactured in accordance with 5.2, 5.3, 5.4 and 5.5.

5.6.2 Welding is to be carried out in accordance with an approved and qualified procedure by suitably qualified welders.

5.6.3 Fabricated pipework may be supplied in the as-welded condition without subsequent solution treatment provided that welding procedure tests have demonstrated satisfactory material properties including resistance to intercrystalline corrosion.

5.6.4 In addition, butt welds are to be subjected to 5 per cent radiographic examination for Class I, and 2 per cent for Class II pipes.

5.6.5 Fabricated pipework in the as-welded condition and intended for systems located on deck is to be protected by a suitable corrosion control coating.

5.7 Certification of materials

5.7.1 Each test certificate is to be of the type and give the information detailed in Ch 1,3.1 together with general details of heat treatment and, where applicable, the results obtained from intercrystalline corrosion tests. As a minimum, the chemical composition is to include the content of all the elements detailed in Table 6.5.1.

■ *Section 6* Boiler and superheater tubes

6.1 Scope

6.1.1 Provision is made in this Section for boiler and superheater tubes in carbon, carbon-manganese and low alloy steels.

6.1.2 Austenitic stainless steels may also be used for this type of service. Where such applications are proposed, details of the chemical composition, heat treatment and mechanical properties are to be submitted for consideration and approval.

6.2 Manufacture and chemical composition

6.2.1 Tubes are to be seamless or welded and are to be manufactured in accordance with the requirements of Sections 2 and 3, respectively.

6.2.2 The method of deoxidation and the chemical composition of ladle samples are to comply with the requirements given in Table 6.2.1 or 6.3.1, as appropriate.

6.3 Heat treatment

6.3.1 All tubes are to be supplied in accordance with the requirements given in Table 6.2.3 or 6.3.3 as appropriate, except that 1Cr½Mo steel may be supplied in the normalised only condition when the carbon content does not exceed 0,15 per cent.

6.4 Mechanical tests

6.4.1 Tubes are to be presented for test in batches as defined in Section 1.

6.4.2 Each boiler and superheater tube selected for test is to be subjected to at least the following:
(a) Tensile test.
(b) Flattening or bending test.
(c) Expanding or flanging test.

6.4.3 The results of all mechanical tests are to comply with the appropriate requirements given in Table 6.6.1.

6.5 Mechanical properties for design

6.5.1 The mechanical properties at elevated temperature for carbon and carbon-manganese steels in Grades 320 to 460, 1Cr½Mo and 2¼Cr1Mo steels can be taken from the appropriate Tables in Section 2.

6.5.2 Where rimming steel is used, the design temperature is limited to 400°C.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 6.6.1 Mechanical properties for acceptance purposes: boiler and superheater tubes

Type of steel	Grade	Yield stress N/mm^2	Tensile strength N/mm^2	Elongation on $5{,}65\sqrt{S_o}$ % minimum	Flattening test constant *C*	Bend test diameter of former (*t* = thickness)	Drift expanding and flanging test minimum % increase in outside diameter		
							Ratio $\frac{\text{Inside diameter}}{\text{Outside diameter}}$		
							≤0,6	>0,6 ≤0,8	>0,8

Iron Castings

Section

1 **General requirements**

2 **Grey iron castings**

3 **Spheroidal or nodular graphite iron castings**

4 **Iron castings for crankshafts**

■ *Section 1* General requirements

1.1 Scope

1.1.1 This Section gives the general requirements for both grey (flake) and spheroidal (nodular) graphite iron castings intended for use in the construction of ships, other marine structures, machinery, boilers, pressure vessels and piping systems.

1.1.2 Where required by the relevant Rules dealing with design and construction, castings are to be manufactured and tested in accordance with Chapters 1 and 2, together with the requirements given in this Section and either Section 2 for grey iron castings or Section 3 for spheroidal graphite iron castings. Castings for crankshafts are additionally to comply with the requirements detailed in Section 4.

1.1.3 As an alternative to 1.1.2, castings which comply with National or proprietary specifications may be accepted, provided that these specifications give reasonable equivalence to the requirements of this Chapter or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of Chapter 1.

1.1.4 Where small castings are produced in large quantities, or where castings of the same type are produced in regular quantities, alternative survey procedures, in accordance with Ch 1,2.2, may be adopted subject to approval by Lloyd's Register (hereinafter referred to as 'LR').

1.2 Manufacture

1.2.1 Castings as designated in 1.1.2 are to be made at foundries approved by LR.

1.2.2 Suitable mechanical methods are to be employed for the removal of surplus material from castings. Thermal cutting processes are not acceptable, except as a preliminary operation to mechanical methods.

1.3 Quality of castings

1.3.1 Castings are to be free from surface or internal defects which would be prejudicial to their proper application in service. The surface finish is to be in accordance with good practice and any specific requirements of the approved plan.

1.4 Chemical composition

1.4.1 The chemical composition of the iron used is left to the discretion of the manufacturer, who is to ensure that it is suitable to obtain the mechanical properties specified for the castings.

1.5 Heat treatment

1.5.1 Except as required by 1.5.2, castings may be supplied in either the as cast or heat treated condition.

1.5.2 For some applications, such as elevated temperature service, or where dimensional stability is important, castings may require to be given a suitable tempering or stress relieving heat treatment. This is to be carried out after any refining heat treatment and before machining.

1.5.3 Where it is proposed to carry out local hardening of the surface of a casting, full details of the proposed procedure are to be submitted for approval.

1.6 Test material

1.6.1 At least one test sample is to be provided for each casting or batch of castings. For large castings, where more than one ladle of metal is used, one test sample is to be provided, from each ladle used.

1.6.2 A batch testing procedure may be adopted for castings with a fettled mass of 1 tonne or less. All castings in a batch are to be of similar type and dimensions, and cast from the same ladle of metal. One test sample is to be provided for each multiple of two tonnes of fettled castings in the batch.

1.6.3 Where separately cast test samples are used, they are to be cast in moulds made from the same type of material as used for the castings and are not to be stripped from the moulds until the temperature is below 500°C.

1.6.4 All test samples are to be suitably marked to identify them with the castings which they represent.

1.6.5 Where castings are supplied in the heat treated condition, the test samples are to be heat treated together with the castings which they represent. For cast-on test samples, the sample is not to be separated from the casting until after heat treatment.

1.7 Mechanical tests

1.7.1 One tensile specimen is to be prepared from each test sample. The dimensions of the test specimens and the testing procedures used are to be in accordance with Chapter 2.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.7.2 The results of all tensile tests are to comply with the requirements given in Section 2, 3 or 4, as appropriate.

1.7.3 In the case of castings supplied in the as cast condition which initially do not meet the requirements of 1.7.2, the manufacturer, by agreement with the purchaser, has the right to heat treat the castings, together with the representative test samples, and re-submit them for acceptance.

1.7.4 In the case of a batch of castings supplied in the heat treated condition which initially do not meet the requirements of 1.7.2, the manufacturer has the right to re-heat treat the batch together with the representative test samples, and re-submit the castings for acceptance. The number of reheat treatments and retestings will be restricted to two.

1.8 Visual and non-destructive examination

1.8.1 All castings are to be cleaned and adequately prepared for examination. The surfaces are not to be hammered, peened or treated in any way which may obscure defects.

1.8.2 The accuracy and verification of dimensions are the responsibility of the manufacturer, unless otherwise agreed.

1.8.3 All castings are to be presented to the Surveyor for visual examination and this is to include the examination of internal surfaces where applicable.

1.8.4 The non-destructive examination of castings is not required unless otherwise stated in the approved plan or where there is reason to suspect the soundness of the casting.

1.8.5 In the event of any casting proving defective during subsequent machining or testing it is to be rejected notwithstanding any previous certification.

1.9 Rectification of defective castings

1.9.1 At the discretion of the Surveyor, small surface blemishes may be removed by local grinding.

1.9.2 Subject to the prior approval of the Surveyor, castings containing local porosity may be rectified by vacuum impregnation with a suitable plastic filler, provided that the extent of the porosity is such that it does not adversely affect the strength of the casting.

1.9.3 Repairs by welding are not permitted on grey cast iron parts and generally not permitted for spheroidal or nodular graphite iron castings, but may be considered in special circumstances for spheroidal or nodular graphite iron castings. In such cases, full details of the proposed repair procedure are to be submitted for approval prior to the commencement of the proposed rectification.

1.10 Pressure testing

1.10.1 When required by the relevant Rules, castings are to be pressure tested before final acceptance. These tests are to be carried out in the presence and to the satisfaction of the Surveyor.

1.11 Identification of castings

1.11.1 The manufacturer is to adopt a system of identification which will enable all finished castings to be traced to the original cast, and the Surveyor is to be given full facilities for tracing the castings when required.

1.11.2 Before acceptance, all castings which have been tested and inspected with satisfactory results are to be clearly marked by the manufacturer with the following particulars:

(a) Type and grade of cast iron.
(b) Identification number, cast number or other marking which will enable the full history of the casting to be traced.
(c) Manufacturer's name or trade mark.
(d) LR or Lloyd's Register and the abbreviated name of LR's local office.
(e) Personal stamp of Surveyor responsible for inspection.
(f) Test pressure, where applicable.
(g) Date of final inspection.

1.11.3 Where small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with the Surveyor.

1.12 Certification of materials

1.12.1 A LR certificate is to be issued, *see* Ch 1,3.1.

1.12.2 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each casting or batch of castings which has been accepted:

(a) Purchaser's name and order number.
(b) Description of castings and quality of cast iron.
(c) Identification number.
(d) General details of heat treatment, where applicable.
(e) Results of mechanical tests.
(f) Test pressure, where applicable.
(g) When specially required, the chemical analysis of ladle samples.

1.12.3 Where applicable, the manufacturer is to provide a signed statement regarding non-destructive testing as required by 1.8, together with a statement and/or a sketch detailing the extent and position of all weld repairs made to each casting as required by 1.9.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

■ *Section 2* Grey iron castings

2.1 Scope

2.1.1 This Section gives the specific requirements for grey cast iron castings.

2.2 Test material

2.2.1 Separately cast test samples in the form of cylindrical bars, 30 mm diameter and of a suitable length, are to be used unless otherwise agreed by LR. Test samples of other dimensions may be specially required for some components as may cast-on samples. In these circumstances, the tensile strength requirements are to be agreed.

2.2.2 When two or more test samples are cast simultaneously in a single mould, the bars are to be at least 50 mm apart.

2.2.3 Test samples may be cast integrally when a casting is both more than 20 mm thick and its mass exceeds 200 kg, subject to agreement between the manufacturer and the purchaser. The type and location of the samples are to be such as to provide approximately the same cooling conditions as for the casting it represents and are also subject to agreement.

2.2.4 For continuous melting of the same grade of cast iron in large tonnages the mass of a batch may be taken as the output of two hours of pouring.

2.2.5 Where 2.2.4 applies and production is carefully monitored by systematic checking of the melting process by, for example, chill testing, chemical analysis or thermal analysis, test samples may be taken at longer intervals as agreed by the Surveyor.

2.3 Mechanical tests

2.3.1 Only the tensile strength is to be determined, and the results obtained from tests are to comply with the minimum value specified for the castings being supplied. Except for crankshaft castings (*see* Section 4), the specified tensile strength is to be not less than 200 N/mm^2 subject to any additional requirements of the relevant Rules. The fractured surfaces of all tensile test specimens are to be granular and entirely grey in appearance.

■ *Section 3* Spheroidal or nodular graphite iron castings

3.1 Scope

3.1.1 This Section gives the specific requirements for spheroidal or nodular graphite iron castings.

3.1.2 These requirements are generally applicable to castings intended for use at ambient temperatures. Additional requirements will be necessary when the castings are intended for service at either low or elevated temperatures. Impact test requirements are given for low temperature service in 3.4.2.

3.2 Heat treatment

3.2.1 The special qualities with 350 N/mm^2 and 400 N/mm^2 nominal tensile strength and impact test are to undergo a ferritising heat treatment, *see* 3.4.2.

3.3 Test material

3.3.1 The test samples are to be as detailed in Figs. 7.3.1, 7.3.2 or 7.3.3 The dimensions of the test specimens and testing procedures used are to be in accordance with Chapter 2. Test samples of other dimensions may be specially required for some castings and these are to be agreed with the Surveyor.

3.3.2 The test samples may be either gated to the casting or separately cast.

3.3.3 Where separately cast test samples are used, they are to be taken towards the end of pouring of the castings.

3.4 Mechanical tests

3.4.1 The tensile strength and elongation are to be determined and are to comply with the requirements of Table 7.3.1. Minimum values for the 0,2 per cent proof stress are also included in this Table but are to be determined only if included in the specification. Typical ranges of hardness values are also given in Table 7.3.1 and are intended for information purposes.

3.4.2 Impact tests may be required for some applications in which case the selection of the grade is to be confined to those listed in Table 7.3.2. These castings are to be given a ferritising heat treatment. The mechanical test results are to comply with Table 7.3.2.

3.4.3 Castings may be supplied to any specified minimum tensile strength selected within the general limits detailed in Tables 7.3.1 and 7.3.2 but subject to any additional requirements of the relevant Rules.

3.5 Metallographic examination

3.5.1 Samples for metallographic examination are to be prepared for spheroidal or nodular graphite iron castings. These samples are to be representative of each ladle used and may conveniently be taken from the tensile test specimens. Alternative arrangements for the provision of these samples may, however, be adopted subject to the concurrence of the Surveyor. They are, however, to be taken towards the end of the pour.

Specified minimum tensile strength N/mm^2	0,2% proof stress minimum (*see* Note 1) N/mm^2	Elongation on 5,65 $\sqrt{S_o}$ minimum % (*see* Note 2)	Typical hardness value	Charpy V-notch impact tests	
				Test temperature °C (*see* Note 3)	Average energy J minimum (*see* Note 4)
350	220	22	110 – 170	20 –40	17 (14) 12 (10)
400	250	18	140 – 200	20 –20	14 (11) 12 (10)

NOTES
1. Proof stresses need only be determined if specifically requested.
2. In the case of integrally cast samples, the acceptable elongation may be taken as 2 percentage points less.
3. Tests need only be made at either of the temperatures listed, as appropriate.
4. The average value measured on three Charpy V-notch specimens. One of the three values may be below the specified minimum average value, but not less than the value shown in brackets.
5. Typical structure of the matrix is ferrite.

■ *Section 4*
Iron castings for crankshafts

4.1 Scope

4.1.1 This Section gives additional requirements for cast iron crankshafts intended for diesel engines and compressors. For both of these applications, details of the proposed specification are to be submitted for approval.

4.1.2 Crankshaft castings in grey iron are acceptable only for compressors, and the specified minimum tensile strength is to be not less than 300 N/mm^2.

4.1.3 For crankshaft castings in spheroidal or nodular graphite iron, the specified minimum tensile strength is to be not less than 370 N/mm^2.

4.2 Manufacture

4.2.1 Details of the method of manufacture, including the arrangements proposed for the provision of test material, are to be submitted for approval.

4.2.2 Tests to demonstrate the soundness of prototype castings and the mechanical properties at important locations will be required.

4.3 Heat treatment

4.3.1 In general, crankshaft castings other than those which are fully annealed, normalised or oil quenched and tempered, are to receive a suitable stress relief heat treatment before machining.

4.3.2 Where it is proposed to harden the surfaces of machined pins and/or journals of cast iron crankshafts, details of the process are to be submitted for approval. Before such a process is applied to a crankshaft it is to be demonstrated by procedure tests, and to the satisfaction of the Surveyor, that the process is suitably controlled and does not impair the strength or soundness of the material.

4.4 Test material

4.4.1 Unless otherwise approved, the dimensions of the test samples are to be such as to ensure that they have mechanical properties representative of those of the average section of the crankshaft casting.

4.4.2 For large crankshaft castings, the test samples are to be cast integral with, or gated from, each casting.

4.4.3 The batch testing procedure detailed in 1.6.2 may be adopted only where small and identical crankshaft castings are produced in quantity. Generally, the fettled mass of each casting in a batch is not to exceed 100 kg, and in addition to tensile tests, the hardness of each casting is to be determined. For this purpose, a small flat is to be ground on each crankshaft, and Brinell hardness tests are to be carried out. The results obtained from these tests are to comply with the approved specification.

4.5 Non-destructive examination

4.5.1 Cast crankshafts are to be subjected to a full magnetic particle or dye penetrant examination after final machining and completion of any surface hardening operations.

4.5.2 Particular attention is to be given to the testing of the pins, journals and associated fillet radii.

4.5.3 Cracks and crack-like defects are not acceptable. Fillet radii are to be free from any indications.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.6 Rectification of defective castings

4.6.1 Cast iron crankshafts are not to be repaired by welding, and blemishes are not to be plugged with a filler.

4.7 Certification of materials

4.7.1 The chemical composition of ladle samples is to be given in addition to the other particulars detailed in 1.12.2.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Aluminium Alloys

Chapter 8

Section 1

Section

1 **Plates, bars and sections**

2 **Aluminium alloy rivets**

3 **Aluminium alloy castings**

4 **Aluminium/steel transition joints**

■ *Section 1* Plates, bars and sections

1.1 Scope

1.1.1 This Section makes provision for aluminium alloy plates, bars and sections intended for use in the construction of ships and other marine structures and for cryogenic applications.

1.1.2 Except as provided in 1.1.4, all items are to be manufactured and tested in accordance with the appropriate requirements of Chapters 1 and 2 and those detailed in this Section.

1.1.3 Plates and sections less than 3,0 mm thick may be manufactured and tested in accordance with the requirements of an acceptable national specification.

1.1.4 Plates less than 3,0 mm thick and sections less than 40 mm x 40 mm x 3,0 mm may be manufactured and tested in accordance with the requirements of an acceptable National specification.

1.1.5 Materials intended for the construction of cargo tanks or storage for liquefied gases, and for other low temperature applications, are to be manufactured in the 5083 alloy in the annealed condition.

1.1.6 As an alternative to 1.1.2 and 1.1.4, materials which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section and are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of Chapter 1.

1.2 Manufacture

1.2.1 Aluminium alloys are to be manufactured at works approved by Lloyd's Register (hereinafter referred to as 'LR').

1.2.2 The alloys may be cast either in ingot moulds or by an approved continuous casting process. Plates are to be formed by rolling and may be hot or cold finished. Bars and sections may be formed by extrusion, rolling or drawing.

1.2.3 All melts are to be suitably degassed prior to casting such that the aim hydrogen content is less than 0,2 ml per 100 g.

1.3 Quality of materials

1.3.1 Materials are to be free from surface or internal defects of such a nature as would be harmful in service.

1.3.2 The manufacturer is to verify the integrity of pressure welds of closed extrusion profiles in accordance with 1.10.

1.4 Dimensional tolerances

1.4.1 Underthickness tolerances for rolled products for marine construction are given in Table 8.1.1.

Table 8.1.1 Underthickness tolerances for rolled products for marine construction

Nominal thickness range, mm	Underthickness tolerance for nominal width range, mm		
	≤1500	>1500 ≤2000	>2000 ≤3500
≥3,0 <4,0	0,10	0,15	0,15
≥4,0 <8,0	0,20	0,20	0,25
≥8,0 <12	0,25	0,25	0,25
≥12 <20	0,35	0,40	0,50
≥20 <50	0,45	0,50	0,65

1.4.2 Underthickness tolerances for extruded products are to comply with an acceptable National or International Standard.

1.4.3 There are to be no underthickness tolerances for materials for application in cryogenic process pressure vessels.

1.4.4 Dimensional tolerances other than permitted underthicknesses are to comply with an acceptable National or International Standard.

1.4.5 Verification of dimensions is the responsibility of the manufacturer. Acceptance by Surveyors of material which is later found to be defective does not absolve the manufacturer from this responsibility.

1.5 Chemical composition

1.5.1 Samples for chemical analysis are to be taken representative of each cast, or the equivalent where a continuous melting process is involved.

1.5.2 The chemical composition of these samples is to comply with the requirements of Table 8.1.2.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 8.1.2 Chemical composition, percentage

Element	5083	5383	5059	5086	5754	5456	6005–A (*see* Note 1)	6061 (*see* Note 1)	6082

NOTES
1. These alloys are not normally acceptable for application in direct contact with sea-water.
2. Mn + Cr = 0,10 min., 0,60 max.
3. Mn + Cr = 0,12 min., 0,50 max.

1.6 Heat treatment

1.6.1 The Aluminium 5000 series alloys, capable of being strain hardened, are to be supplied in any of the following temper conditions:

- O annealed
- H111 annealed with slight strain hardening
- H112 strain hardened from working at elevated temperatures
- H116 strain hardened and with specified resistance to exfoliation corrosion for alloys where the magnesium content is 4 per cent or more
- H321 strain hardened and stabilised.

1.6.2 The H116 temper is specially developed for use in a marine environment.

1.6.3 The Aluminium 6000 series alloys, capable of being age hardened, are to be supplied in either of the following temper conditions:

- T5 hot worked and artificially aged
- T6 solution treated and artificially aged.

1.7 Test material

1.7.1 Materials of the same product form, (i.e. plates, sections or bars) and thickness and from a single cast or equivalent, are to be presented for test in batches of not more than 2 tonnes, with the exceptions of those given in 1.7.2, 1.7.3 and 1.7.4.

1.7.2 For single plates or coils weighing more than 2 tonnes, only one tensile specimen per plate or coil is to be taken.

1.7.3 A tensile test specimen is required from each plate to be used in the construction of cargo tanks, secondary barriers and process pressure vessels with design temperatures below –55°C.

1.7.4 Extrusions, bars and sections of less than 1 kg/m in nominal weight are to be tested in batches of 1 tonne. Where the nominal weight is greater than 5 kg/m, one tensile test is to be carried out for every three tonnes produced, or fractions thereof.

1.7.5 If the material is supplied in the heat treated condition, each batch is to be treated in the same furnace charge or subjected to the same finishing treatment when a continuous furnace is used.

1.7.6 For plates over 300 mm in width, tensile test specimens are to be cut with their length transverse to the principal direction of rolling. For narrow plates and for sections and bars, the test specimens are to be cut in the longitudinal direction. Longitudinal tensile test specimens are accepted for the strain hardenable 5000 series alloys.

1.7.7 Longitudinal tensile test specimens from a plate are to be taken at 1/3 width from the longitudinal edge. Longitudinal tensile test specimens taken from extruded sections should be taken in the range from 1/3 to 1/2 of the distance from the edge to the centre of the thickest region of the section.

1.8 Mechanical tests

1.8.1 At least one tensile test specimen is to be prepared from each batch of material submitted for acceptance.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 8.1.3 Minimum mechanical properties for acceptance purposes of selected rolled aluminium alloy products

Alloy and temper condition	Thickness, t, mm	0,2% proof stress R_p, N/mm^2	Tensile strength R_m N/mm^2	Elongation on $4d$, %	Elongation on $5{,}65\sqrt{S_o}$, %

5383-O	$3 \le t \le 50$	145	290	16	17
5383-H116	$3 \le t \le 50$	220	305	10	10
5383-H321	$3 \le t \le 50$	220	305	10	10
5456-O	$3 \le t \le 6{,}3$ $6{,}3 \le t \le 50$	130–205 125–205	290–365 285–360	16 16	— 14
5456-H116	$3 \le t \le 30$ $30 < t \le 40$ $40 < t \le 50$	230 215 200	315 305 285	10 — —	10 10 10
5456-H321	$3 \le t \le 12{,}5$ $12{,}5 \le t \le 40$ $40 \le t \le 50$	230–315 215–305 200–295	315–405 305–385 285–370	12 — —	— 10 10
5754-O	$3 \le t \le 50$	80	190–240	18	17

NOTES
1. 10% for thickness up to and including 12,5 mm.
2. 8% for thickness up to and including 6,3 mm.
3. For application to liquefied natural gas carriers or liquefied natural gas tankers where thicknesses are in excess of 50 mm, the mechanical properties given in this table are, in general, to be complied with.

1.8.2 Tensile test specimens are to be machined to the dimensions given in Fig. 2.2.3 in Chapter 2. Alternatively, machined proportional test specimens of circular cross-section in accordance with Fig. 2.2.2 in Chapter 2 may be used provided that the diameter is not less than 10 mm. Round bars may be tested in full section, or test specimens may be machined in accordance with the dimensions given in Fig. 2.2.2 in Chapter 2.

1.8.3 The results of all tensile tests are to comply with the values given in Table 8.1.4, as applicable.

1.9 Corrosion tests

1.9.1 Rolled 5000 series alloys of type 5083, 5383, 5059, 5456 and 5086 in the H116 and H321 tempers intended for use in marine hull construction or in marine applications with frequent direct contact with seawater are to be corrosion tested with respect to exfoliation and intergranular corrosion resistance.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 8.1.4 Minimum mechanical properties for acceptance purposes of selected extruded aluminium alloy products

Alloy and temper condition	Thickness, t, mm	0,2% proof stress R_p, N/mm^2	Tensile strength R_m N/mm^2	Elongation on $4d$, %	Elongation on $5{,}65\sqrt{S_o}$, %
5083-O	$3 \le t \le 50$	110	270–350	14	12
5083-H111	$3 \le t \le 50$	165	275	12	10
5083-H112	$3 \le t \le 50$	110	270	12	10
5086-O	$3 \le t \le 50$	95	240–315	14	12
5086-H111	$3 \le t \le 50$	145	250	12	10
5086-H112	$3 \le t \le 50$	95	240	12	10
5059-H112	$3 \le t \le 50$	200	330	—	10
5383-O	$3 \le t \le 50$	145	290	17	17
5383-H111	$3 \le t \le 50$	145	290	17	17
5383-H112	$3 \le t \le 50$	190	310	—	13
6005A-T5	$3 \le t \le 50$	215	260	9	8
6005A-T6	$3 \le t \le 10$ $10 < t \le 50$	215 200	260 250	8 8	6 6
6061-T6	$3 \le t \le 50$	240	260	10	8
6082-T5	$3 \le t \le 50$	230	270	8	6
6082-T6	$3 \le t \le 5$ $5 < t \le 50$	250 260	290 310	6 10	— 8

NOTE
The values are applicable for longitudinal and transverse tensile test specimens as well.

1.9.2 The manufacturer is to establish the relationship between microstructure and resistance to corrosion when the above alloys are approved. A reference photomicrograph taken at 500x, is to be prepared for each of the alloy-tempers and thickness ranges relevant. The reference photographs are to be taken from samples which have exhibited no evidence of exfoliation corrosion and a pitting rating of PB or better, when subjected to the test described in ASTM G66 (ASSET).The samples are also to have exhibited resistance to intergranular corrosion at a mass loss no greater than 15 mg/cm^2, when subjected to the test described in ASTM G67. Upon satisfactory establishment of the relationship between microstructure and resistance to corrosion, the master photomicrographs and the results of the corrosion tests are to be approved by LR. Production practices are not to be changed after approval of the reference micrographs.

1.9.3 For batch acceptance of 5000 series alloys in the H116 and H321 tempers, metallographic examination of one sample selected from mid width at one end of a coil or random sheet or plate is to be carried out. The microstructure of the sample is to be compared to the reference photomicrograph of acceptable material in the presence of the Surveyor. A longitudinal section perpendicular to the rolled surface is to be prepared for metallographic examination. If the microstructure shows evidence of continuous grain boundary network of aluminium-magnesium precipitate in excess of the reference photomicrographs of acceptable material, the batch is either to be rejected or tested for exfoliation corrosion resistance and intergranular corrosion resistance subject to the agreement of the Surveyor. The corrosion tests are to be in accordance with ASTM G66 and G67 or equivalent standards. If the results from testing satisfy the acceptance criteria stated in 1.9.2 the batch is accepted, otherwise it is to be rejected.

1.9.4 As an alternative to metallographic examination, each batch may be tested for exfoliation corrosion resistance and intergranular corrosion resistance, in accordance with ASTM G66 and G67 or equivalent standards.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.9.5 Tempers that are corrosion tested in accordance with 1.9.3 are to be marked 'M' after the temper condition, e.g. 5083 H321 M.

1.10 Pressure weld tests

1.10.1 The integrity of pressure welds of closed profile extrusions is to be verified by examination of macrosections or drift expansion tests.

1.10.2 Every closed profile extrusion is to be sampled, except where the closed profile extrusions are equal to or shorter than 6,0 m long, in which case a batch is to comprise five profiles. Every sample is to be tested at both ends after final heat treatment.

1.10.3 Where verification is by examination of macrosections, no indication of lack of fusion is permitted.

1.10.4 Where verification of fusion at pressure welds of closed profile extrusions is by drift expansion test, testing is to be generally in accordance with Ch 2,4.3. The minimum included angle of the mandrel is to be 60°, and the minimum specimen length, 50 mm. For acceptance, there is to be no failure by a clean split along the weld line.

1.11 Visual and non-destructive examination

1.11.1 Surface inspection and verification of dimensions are the responsibility of the manufacturer, and acceptance by the Surveyors of material later found to be defective shall not absolve the manufacturer from this responsibility.

1.11.2 In general, the non-destructive examination of materials is not required for acceptance purposes. Manufacturers are expected, however, to employ suitable methods of non-destructive examination for the general maintenance of quality standards.

1.11.3 For applications where the non-destructive examination of materials is considered to be necessary, the extent of this examination, together with appropriate acceptance standards, are to be agreed between the purchaser, manufacturer and Surveyor.

1.12 Rectification of defects

1.12.1 Slight surface imperfections may be removed by mechanical means, provided that the prior agreement of the Surveyor is obtained, that the work is carried out to his satisfaction and that the final dimensions are acceptable. The repair of defects by welding is not allowed.

1.13 Identification

1.13.1 The manufacturer is to adopt a system of identification which will ensure that all finished material in a batch presented for test is of the same nominal chemical composition.

1.13.2 Products are to be clearly marked by the manufacturer in accordance with the requirements of Chapter 1. The following details are to be shown on all materials which have been accepted:

(a) Manufacturer's name or trade mark.
(b) Alloy grade and temper condition.
(c) Identification mark which will enable the full history of the item to be traced.
(d) The stamp of the LR brand, ℞.

1.14 Certification of materials

1.14.1 A manufacturer's certificate validated by LR is to be issued, *see* Ch 1,3.1.

1.14.2 Each test certificate is to include the following particulars:

(a) Purchaser's name and order number.
(b) Contract number.
(c) Address to which material is to be despatched.
(d) Description and dimensions.
(e) Alloy grade and temper condition.
(f) Identification mark which will enable the full history of the item to be traced.
(g) Chemical composition.
(h) Mechanical test results (not required on shipping statement).
(j) Details of temper condition and heat treatment, where applicable.

1.14.3 Where the alloy is not produced at the works at which it is wrought, a certificate is to be supplied by the manufacturer of the alloy stating the cast number and chemical composition. The works at which the alloy was produced must be approved by LR.

■ *Section 2* Aluminium alloy rivets

2.1 Scope

2.1.1 Provision is made in this Section for aluminium alloy rivets intended for use in the construction of marine structures.

2.1.2 They are to be manufactured and tested in accordance with the appropriate requirements of Section 1 and those detailed in this Section.

2.2 Chemical composition

2.2.1 The chemical composition of bars used for the manufacture of rivets is to comply with the requirements of Table 8.2.1.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 8.2.1 Chemical composition, percentage

Element	5154A	6082
Copper	0,10 max.	0,10 max.
Magnesium	3,1 – 3,9	0,6 – 1,2
Silicon	0,50 max.	0,7 – 1,3
Iron	0,50 max.	0,50 max.
Manganese	0,1 – 0,5	0,4 – 1,0
Zinc	0,20 max.	0,20 max.
Chromium	0,25 max.	0,25 max.
Titanium	0,20 max.	0,10 max.
Other elements: each	0,05 max.	0,05 max.
total	0,15 max.	0,15 max.
Aluminium	Remainder	Remainder

2.3 Heat treatment

2.3.1 Rivets are to be supplied in the following condition:
5154A – annealed
6082 – solution treated.

2.4 Test material

2.4.1 Bars intended for the manufacture of rivets are to be presented for test in batches of not more than 250 kg. The material in each batch is to be the same diameter and nominal chemical composition.

2.4.2 At least one test sample is to be selected from each batch and, prior to testing, is to be heat treated in full cross-section and in a manner simulating the heat treatment applied to the finished rivets.

2.5 Mechanical tests

2.5.1 At least one tensile and one dump test specimen are to be prepared from each test sample.

2.5.2 The tensile test specimen may be either a suitable length of bar tested in full cross-section or a specimen machined to the dimensions given in Fig. 2.2.2 in Chapter 2.

2.5.3 The dump test specimen is to consist of a section cut from the bar with the ends perpendicular to the axis. The length of this section is to be equal to the diameter of the bar.

2.5.4 The results of tensile tests are to comply with the appropriate requirements of Table 8.2.2.

Table 8.2.2 Mechanical properties for acceptance purposes

Mechanical properties	5154A	6082
0,2% proof stress N/mm^2 min.	90	120
Tensile strength N/mm^2 min.	220	190
Elongation on $5{,}65\sqrt{S_o}$ % min.	18	16

2.5.5 The dump test is to be carried out at ambient temperature and is to consist of compressing the specimen until the diameter is increased to 1,6 times the original diameter. After compression, the specimen is to be free from cracks.

2.6 Tests from manufactured rivets

2.6.1 At least three samples are to be selected from each consignment of manufactured rivets. Dump tests as detailed in 2.5 are to be carried out on each sample.

2.7 Identification

2.7.1 Each package of manufactured rivets is to be identified with attached labels giving the following details:
(a) Manufacturer's name or trade mark.
(b) Alloy grade.
(c) Rivet size.

2.8 Certification of materials

2.8.1 A manufacturer's certificate is to be issued (*see* Ch 1,3.1) and for each consignment of manufactured rivets is to include the following particulars:
(a) Purchaser's name and order number.
(b) Description and dimensions.
(c) Specification.

■ *Section 3* Aluminium alloy castings

3.1 Scope

3.1.1 Provision is made in this Section for aluminium alloy castings intended for use in the construction of ships, ships for liquid chemicals and other marine structures and liquefied gas piping systems where the design temperature is not lower than minus 165°C. These materials should not be used for piping systems outside cargo tanks except for short lengths of pipes attached to the cargo tanks in which case fire-resisting insulation should be provided.

3.1.2 Castings are to be manufactured and tested in accordance with Chapters 1 and 2 and also with the requirements of this Section.

3.1.3 As an alternative to 3.1.2, castings which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section or are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of Chapter 1.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

3.2 Manufacture

3.2.1 Castings are to be manufactured at foundries approved by LR.

3.3 Quality of castings

3.3.1 All castings are to be free from surface or internal defects which would be prejudicial to their proper application in service.

3.4 Chemical composition

3.4.1 The chemical composition of a sample from each cast is to comply with the requirements given in Table 8.3.1. Suitable grain refining elements may be used at the discretion of the manufacturer. The content of such elements is to be reported in the ladle analysis.

Table 8.3.1 Chemical composition, percentage

Alloy Element	Al–Mg 3	Al–Si 12	Al–Si 10 Mg	Al–Si 7 High purity
Copper	0,1 max.	0,1 max.	0,1 max.	0,1 max.
Magnesium	2,5—4,5	0,1 max.	0,15—0,4	0,25—0,45
Silicon	0,5 max.	11,0—13,5	9,0—11,0	6,5—7,5
Iron	0,5 max.	0,7 max.	0,6 max.	0,2 max.
Manganese	0,6 max.	0,5 max.	0,6 max.	0,1 max.
Zinc	0,2 max.	0,1 max.	0,1 max.	0,1 max.
Chromium	0,1 max.	—	—	—
Titanium	0,2 max.	0,2 max.	0,2 max.	0,2 max.
Others each	0,05 max.	0,05 max.	0,05 max.	0,05 max.
Total	0,15 max.	0,15 max.	0,15 max.	0,15 max.
Aluminium	Remainder	Remainder	Remainder	Remainder

3.4.2 Where it is proposed to use alloys not specified in Table 8.3.1, details of the chemical composition, heat treatment and mechanical properties are to be submitted for approval.

3.4.3 When a cast is wholly prepared from ingots for which an analysis is already available, and provided that no significant alloy additions are made during melting, the ingot maker's certified analysis can be accepted subject to occasional checks as required by the Surveyor.

3.5 Heat treatment

3.5.1 Castings are to be supplied in the following conditions:

Grade Al-Mg 3 – as-manufactured
Grade Al-Si 12 – as-manufactured
Grade Al-Si 10 Mg – as-manufactured or solution heat treated and precipitation hardened
Grade Al-Si 7 Mg (high purity) – solution heat treated and precipitation hardened.

3.6 Mechanical tests

3.6.1 At least one tensile specimen is to be tested from each cast and, where heat treatment is involved, for each heat treatment batch from each cast. Where continuous melting is employed, 500 kg of fettled castings may be regarded as a cast.

3.6.2 The test samples are to be separately cast in moulds made from the same type of material as used for the castings. These moulds should conform to National Standards.

3.6.3 The method and procedures for the identification of the test specimens, and the castings they represent, are to be agreed with the Surveyor. The identification marks are to be maintained during the preparation of test specimens.

3.6.4 Where castings are supplied in the heat treated condition, the test samples are to be heat treated together with the castings which they represent prior to testing.

3.6.5 The results of all tensile tests are to comply with the appropriate requirements given in Table 8.3.2 and/or Table 8.3.3.

Table 8.3.2 Minimum mechanical properties for acceptance purposes of sand-cast and investment cast reference test pieces

Alloy	Temper (*see* Note)	Tensile strength N/mm^2	Elongation %
Al–Mg 3	M	150	5
Al–Si 12	M	150	3
Al–Si 10 Mg	M	150	2
Al–Si 10 Mg	TF	220	1
Al–Si 7 Mg	TF	230	5

NOTE
M refers to as cast condition.
TF refers to solution heat treated and precipitation hardened condition.

3.6.6 Where the results of a test do not comply with the requirements, the re-test procedure detailed in Ch 2,1.4 is to be applied. Where castings are to be used in the heat treated condition, the re-test sample must have been heat treated together with the castings it represents.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 8.3.3 Minimum mechanical properties for acceptance purposes of chill-cast reference test piece

Alloy	Temper (*see* Note)	Tensile strength N/mm^2	Elongation %
Al–Mg 3	M	150	5
Al–Si 12	M	170	3
Al–Si 10 Mg	M	170	3
Al–Si 10 Mg	TF	240	1,5
Al–Si 7 Mg	TF	250	5

NOTE
M refers to as cast condition.
TF refers to solution heat treated and precipitation hardened condition.

3.7 Visual examination

3.7.1 All castings are to be cleaned and adequately prepared for inspection.

3.7.2 The accuracy and verification of dimensions are the responsibility of the manufacturer, unless otherwise agreed.

3.7.3 Before acceptance, all castings are to be presented to the Surveyor for visual examination.

3.8 Rectification of defective castings

3.8.1 At the discretion of the Surveyor, small surface blemishes may be removed by local grinding.

3.8.2 Where appropriate, repair by welding may be accepted at the discretion of the Surveyor. Such repair is to be made in accordance with an approved procedure.

3.9 Pressure testing

3.9.1 Where required by the relevant Rules, castings are to be pressure tested before final acceptance. Unless otherwise agreed, these tests are to be carried out in the presence and to the satisfaction of the Surveyor.

3.10 Identification

3.10.1 The manufacturer is to adopt a system of identification which will enable all finished castings to be traced to the original cast and the Surveyor is to be given full facilities for tracing the casting when required.

3.10.2 All castings which have been tested and inspected with satisfactory results are to be clearly marked with the following details:
(a) Identification number, cast number or other markings which will enable the full history of the casting to be traced.
(b) LR or Lloyd's Register and the abbreviated name of LR's local office.
(c) Personal stamp of the Surveyor responsible for the inspection.
(d) Test pressure where applicable.
(e) Date of final inspection.

3.10.3 Where small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with the Surveyor.

3.11 Certification of materials

3.11.1 A LR certificate is to be issued (*see* Ch 1,3.1) giving the following particulars for each casting or batch of castings which have been accepted:
(a) Purchaser's name and order number.
(b) Description of castings and alloy type.
(c) Identification number.
(d) Ingot or cast analysis.
(e) General details of heat treatment, where applicable.
(f) Results of mechanical tests.
(g) Test pressure, where applicable.

■ *Section 4* Aluminium/steel transition joints

4.1 Scope

4.1.1 Provision is made in this Section for explosion bonded composite aluminium/steel transition joints used for connecting aluminium structures to steel plating.

4.1.2 Each individual application is to be separately approved as required by the relevant Rules dealing with design and construction.

4.2 Manufacture

4.2.1 Transition joints are to be manufactured by an approved producer in accordance with an approved specification which is to include the maximum temperature allowable at the interface during welding.

4.2.2 The aluminium material is to comply with the requirements of Section 1 and the steel is to be of an appropriate grade complying with the requirements of Ch 3,2.

4.2.3 Alternative materials which comply with International, National or proprietary specifications may be accepted provided that they give reasonable equivalence to the requirements of 4.2.2 or are approved for a specific application.

4.2.4 Intermediate layers between the aluminium and steel may be used, in which case the material of any such layer is to be specified by the manufacturer and is to be recorded in the approval certificate. Any such intermediate layer is then to be used in all production transition joints.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.3 Visual and non-destructive examination

4.3.1 Each composite plate is to be subjected to 100 per cent visual and ultrasonic examination in accordance with a relevant National Standard to determine the extent of any unbonded areas. Unbonded areas are unacceptable and any such area plus 25 mm of surrounding sound material is to be discarded.

4.4 Mechanical tests

4.4.1 Two shear test specimens and two tensile test specimens are to be taken from each end of each composite plate for tests to be made on the bond strength. One shear and one tensile test specimen from each end are to be tested at ambient temperature after heating to the maximum allowable interface temperature, *see* 4.2.1; the other two specimens are to be tested without heat treatment.

4.4.2 Shear tests may be made on a specimen as shown in Fig. 8.4.1 or an appropriate equivalent. Tensile tests may be made across the interface by welding extension pieces to each surface or by the ram method shown in Fig. 8.4.2 or by an appropriate alternative method.

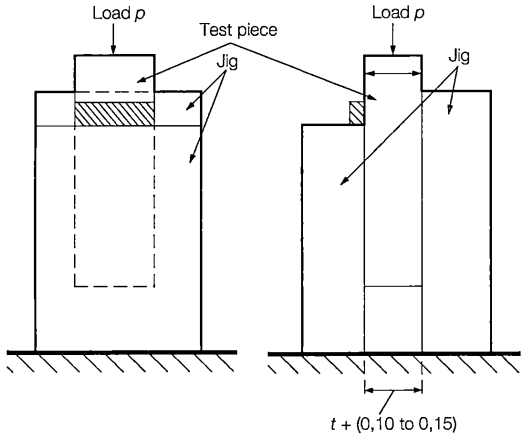

Fig. 8.4.1 Specimen and procedure for shear tests

4.4.3 The shear and tensile strengths of all the test specimens are to comply with the requirements of the manufacturing specification.

4.4.4 If either the shear or tensile strength of the bond is less than the specified minimum but not less than 70 per cent of the specified minimum, two additional shear and two tensile test specimens from each end of the composite plate are to be tested and, in addition, bend tests as described in 4.4.6 and Table 8.4.1 are to be made.

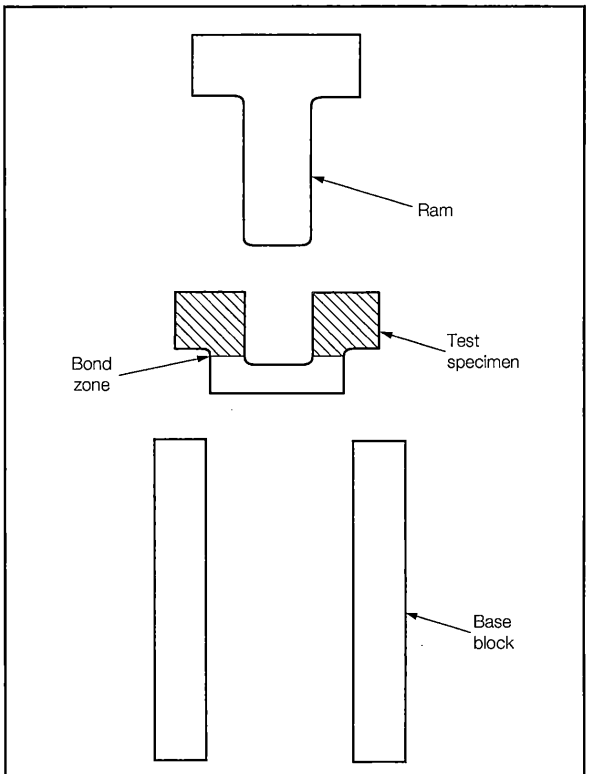

Fig. 8.4.2 Ram tensile test

4.4.5 If either the shear or tensile strength of the bond is less than 70 per cent of the specified minimum the cause is to be investigated. After evaluation of the results of this investigation, LR will consider the extent of composite plate which is to be rejected.

4.4.6 Bend tests, when required, are to be made under the following conditions, as listed in Table 8.4.1:

(a) The aluminium plate is in tension.
(b) The steel plate is in tension.
(c) A side bend is applied.

Table 8.4.1 Bend tests on explosion bonded aluminium/steel composites

Type of test	Minimum bend, degrees	Diameter of former
Aluminium in tension	90	3*T*
Steel in tension	90	3*T*
Side bend	90	6*T*

NOTE
T is the total thickness of the composite plate.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.5 Identification

4.5.1 Each acceptable transition strip is to be clearly marked with the following particulars:

(a) LR or Lloyd's Register and the abbreviated name of LR's local office.
(b) Manufacturer's name or trade mark.
(c) Identification mark for the grade of aluminium.
(d) Identification mark for the grade of steel.

The particulars are to be stamped on the aluminium surface at one end of the strip.

4.6 Certification of materials

4.6.1 A manufacturer's certificate validated by LR is to be issued (*see* Ch 1,3.1) and as a minimum is to include the following particulars:

(a) Purchaser's name and order number.
(b) The contract number for which the material is intended, if known.
(c) Address to which the material is dispatched.
(d) Description and dimensions of the material.
(e) Specifications or grades of both the aluminium alloy and the steel and any intermediate layer.
(f) Cast numbers of the steel and aluminium plates.
(g) Identification number of the composite plate.
(h) Mechanical test results (not required on shipping statement).

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Section

1 **Castings for propellers**

2 **Castings for valves, liners and bushes**

3 **Tubes**

■ *Section 1* Castings for propellers

1.1 Scope

1.1.1 This Section gives the requirements for copper alloy castings for one-piece propellers and separately cast blades and bosses for fixed pitch and controllable pitch propellers (CPP). These include contra-rotating propellers and propulsors fitted to podded drives and azimuth units.

1.1.2 These castings are to be manufactured and tested in accordance with the appropriate requirements of Chapters 1 and 2 and the specific requirements of this Section.

1.1.3 As an alternative to 1.1.2, castings which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section or alternatively are approved for a specific application.

1.1.4 The appropriate requirements of this Section may also be applied to the repair and inspection of propellers which have been damaged during service.

1.1.5 Generally, survey and certification are to be carried out in accordance with the requirements of Chapter 1.

1.2 Manufacture

1.2.1 All castings are to be manufactured at foundries approved by Lloyd's Register (hereinafter referred to as 'LR').

1.2.2 The pouring is to be carried out into dried moulds using degassed liquid metal. The pouring is to avoid turbulent flow. Special devices and/or procedures are to be used to prevent slag flowing into the mould.

1.3 Quality of castings

1.3.1 All castings are to be free from surface or internal defects which would be prejudicial to their proper application in service.

1.3.2 The removal and repair of defects are dealt with in 1.9 and 1.10.

1.4 Chemical composition

1.4.1 The chemical compositions of samples from each melt are to comply with the manufacturing specification approved by LR and also with the overall limits given in Table 9.1.1. In addition to carrying out chemical analysis for the elements given in the Table, it is expected that manufacturers will ensure that any harmful residual elements are within acceptable limits.

1.4.2 The use of alloys whose chemical compositions are different from those detailed in Table 9.1.1 will be given special consideration by LR.

1.4.3 The manufacturer is to maintain records of all chemical analyses, which are to be made available to the Surveyor so that he can satisfy himself that the chemical composition of each casting is within the specified limits.

Table 9.1.1 Chemical composition of propeller and propeller blade castings

Alloy designation	Chemical composition of ladle samples %							
	Cu	Sn	Zn	Pb	Ni	Fe	Al	Mn
Grade Cu 1 Manganese bronze (high tensile brass)	52–62	0,1–1,5	35–40	0,5 max.	1,0 max.	0,5–2,5	0,5–3,0	0,5–4,0
Grade Cu 2 Ni-manganese bronze (high tensile brass)	50–57	0,1–1,5	33–38	0,5 max.	2,5–8,0	0,5–2,5	0,5–2,0	1,0–4,0
Grade Cu 3 Ni-aluminium bronze	77–82	0,1 max.	1,0 max.	0,03 max.	3,0–6,0 (*see* Note)	2,0–6,0 (*see* Note)	7,0–11,0	0,5–4,0
Grade Cu 4 Mn–aluminium bronze	70–80	1,0 max.	6,0 max.	0,05 max.	1,5–3,0	2,0–5,0	6,5–9,0	8,0–20,0

NOTE
For Naval ships, the nickel content is to be higher than the iron content.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.4.4 When a melt is wholly prepared from ingots for which an analysis is already available, and provided that no significant alloy additions are made during melting, the ingot maker's certified analysis can be accepted subject to occasional checks as required by the Surveyor. If any foundry returns are added to the melts, the ingot manufacturer's chemical analyses are to be supplemented by frequent checks as required by the Surveyor.

1.4.5 For alloys Grade Cu 1 and Cu 2, the zinc equivalent shall not exceed 45 per cent, and is to be calculated using the following formula:

$$\text{zinc equivalent \%} = 100 - \frac{100 \times \%Cu}{100 + A}$$

where A is the algebraic sum of the following:

1 x % Sn
5 x % Al
–0,5 x % Mn
–0,1 x % Fe
–2,3 x % Ni

1.4.6 Samples for metallographic examination are to be prepared from the ends of test bars cast from every melt of Grade Cu 1 and Cu 2 alloys. The proportion of alpha-phase determined from the average of at least five counts is to be not less than 25 per cent.

1.5 Heat treatment

1.5.1 At the option of the manufacturer, castings may be supplied in the 'as-cast' or heat treated condition. However, if heat treatment is to be applied, full details are to be included in the manufacturing specification.

1.5.2 If any welds are made in the propeller casting, stress relief heat treatment is required in order to minimise the residual stresses. Requirements concerning such heat treatment are given in 1.10.

1.6 Test material

1.6.1 Test samples are to be cast separately from each melt used for the manufacture of propeller or propeller blade castings.

1.6.2 The test samples are to be of the keel block type, generally in accordance with the dimensions given in Fig. 9.1.1 and are to be cast in moulds made from the same type of material as used for the castings.

1.6.3 The method and procedures for the identification of the test specimens, and the castings they represent, are to be agreed with the Surveyor. The identification marks are to be transferred and maintained during the preparation of test specimens.

1.6.4 Where castings are supplied in the heat treated condition, the test samples are to be heat treated together with the castings which they represent.

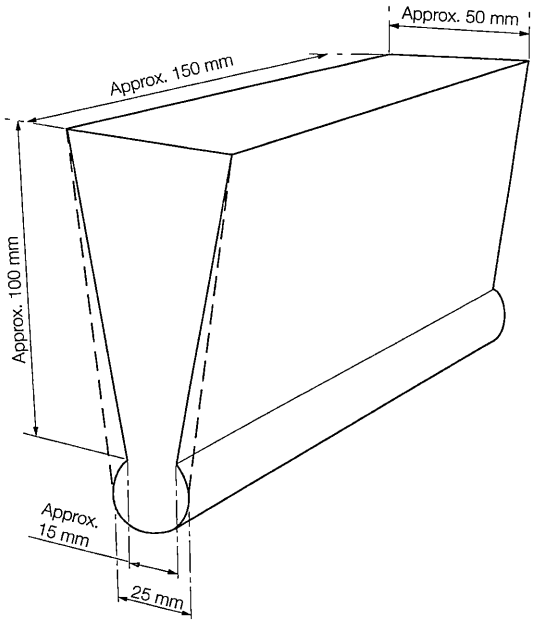

Fig. 9.1.1 Keel block type test sample

1.7 Mechanical tests

1.7.1 At least one tensile test specimen representative of each cast is to be prepared. The dimensions of this test specimen are to be in accordance with Fig. 2.2.1 in Chapter 2.

1.7.2 The results of all tensile tests are to comply with the requirements given in Table 9.1.2.

1.7.3 The mechanical properties of alloys whose chemical compositions do not accord with Table 9.1.1 are to comply with a manufacturing specification approved by LR.

Table 9.1.2 Mechanical properties for acceptance purposes: propeller and propeller blade castings

Alloy designation	0,2% proof stress N/mm^2 minimum	Tensile strength N/mm^2 minimum	Elongation on $5{,}65\sqrt{S_o}$ % minimum
Grade Cu 1 Manganese bronze (high tensile brass)	175	440	20
Grade Cu 2 Ni-manganese bronze (high tensile brass)	175	440	20
Grade Cu 3 Ni-aluminium bronze	245	590	16
Grade Cu 4 Mn-aluminium bronze	275	630	18

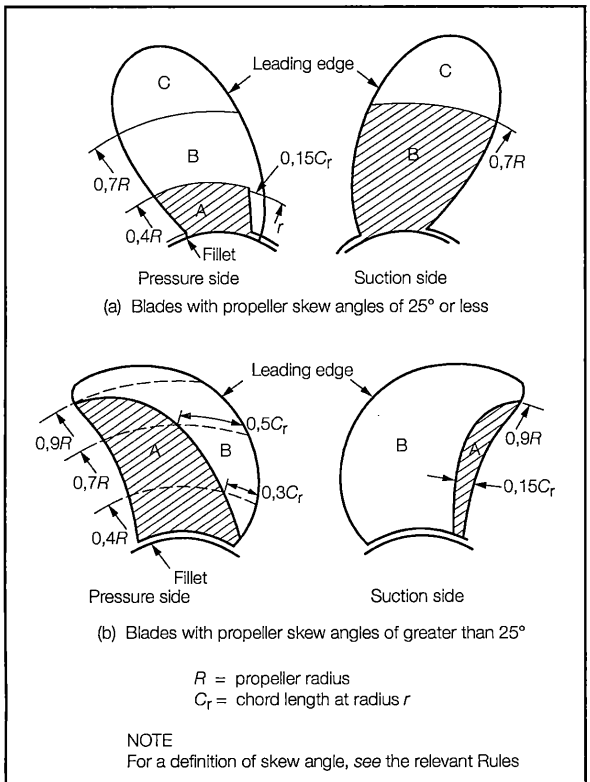
Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.8 Inspection and non-destructive examination

1.8.1 Propeller castings should be visually inspected at all stages of manufacture. The manufacturer is to draw any significant imperfections to the attention of the Surveyor. Such imperfections are to be verified in accordance with 1.9.

1.8.2 All finished castings are to be subjected to a comprehensive visual examination by the Surveyor, including internal surfaces such as the bore and bolt holes.

1.8.3 For the purpose of these requirements, the blades of propellers, including CPP blades, are divided into three severity Zones A, B and C as shown in Fig. 9.1.2 and detailed in 1.8.4 for blades having skew angles of 25° or less and 1.8.5 for blades having skew angles of greater than 25°.



(a) Blades with propeller skew angles of 25° or less

(b) Blades with propeller skew angles of greater than 25°

R = propeller radius
C_r = chord length at radius r

NOTE
For a definition of skew angle, *see* the relevant Rules

Fig. 9.1.2 Severity zones in all propeller blades

1.8.4 **Skew angles of 25° or less:**

- Zone A is the area on the pressure side of the blade from and including the root fillet to 0,4*R* and bounded by the trailing edge and by a line at a distance 0,15 times the chord length from the leading edge.
- Zone B includes the areas inside 0,7*R* on both sides of the blade, excluding Zone A.
- Zone C includes the areas outside 0,7*R* on both sides of the blade.

1.8.5 **Skew angles of greater than 25°:**

- Zone A is the area on the pressure side of the blade bounded by, and including, the root fillet and a line running from the junction of the leading edge with the root fillet to the trailing edge at 0,9*R* and passing through the mid-point of the chord at 0,7*R* and a point situated at 0,3 of the chord length from the leading edge at 0,4*R*.
- Zone A also includes the area along the trailing edge on the suction side of the blade from the root to 0,9*R* and with its inner boundary at 0,15 of the chord length tapering to meet the trailing edge at 0,9*R*.
- Zone B constitutes the whole of the remainder of the blade surfaces.

1.8.6 In propeller blades with continuously loaded tips (CLT), the whole of the tip plate and the adjoining blade to a distance of 100 mm is to be regarded as severity Zone B, *see* Fig. 9.1.3. For propellers with diameters less than 2 m, the width of this zone may be reduced to one tenth of the propeller radius.

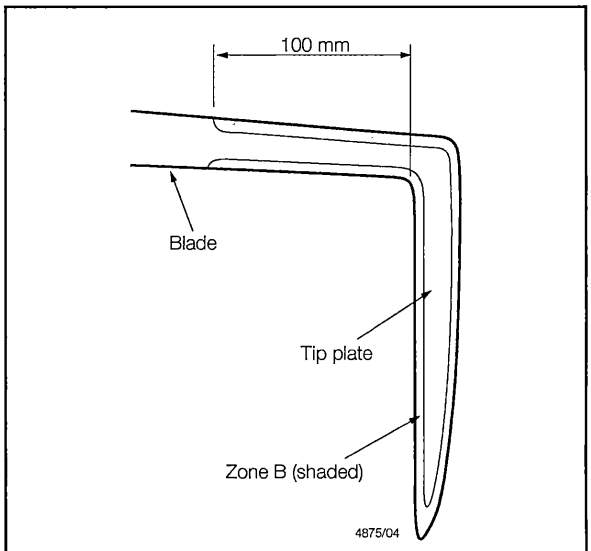


Fig. 9.1.3
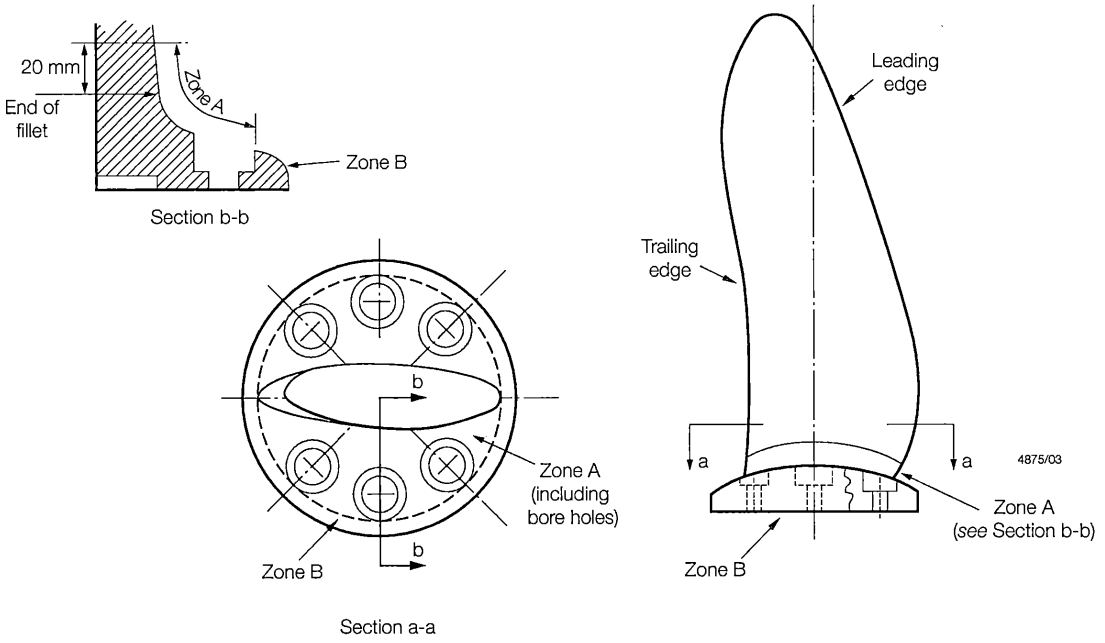
Severity Zone B at Continuously loaded blade tip

1.8.7 In addition, the palm of a CPP blade is divided into severity Zones A and B as shown in Fig. 9.1.4.

1.8.8 If a CPP blade has an integrally cast journal, the fillets of the journal and the adjoining material up to a distance of 20 mm from the fillet run-outs are to be regarded as Zone B, as indicated in Fig. 9.1.5. The remainder of the surface of the journal may be regarded as Zone C.

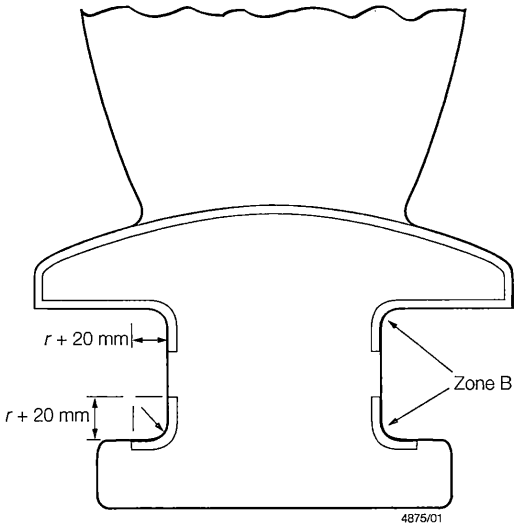
1.8.9 Hubs of controllable pitch propellers are to contain a Zone A region at each blade port as shown in Fig. 9.1.6. The remainder may be regarded as Zone C.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.



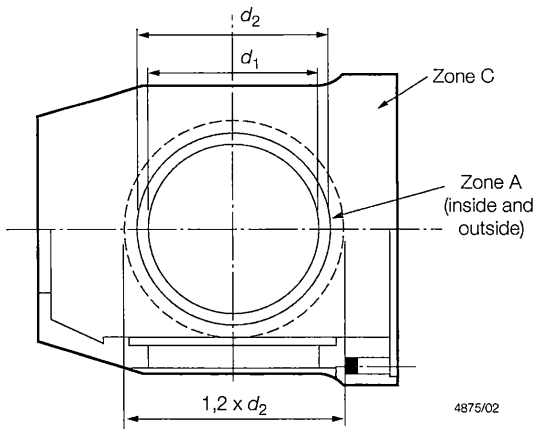
The surfaces of blades are to be divided into severity zones in accordance with Fig. 9.1.2

Fig. 9.1.4 Severity zones for controllable pitch propeller blades



The surfaces of the journal which are not shaded are to be regarded as severity Zone C

Fig. 9.1.5
Severity zones in integrally cast CPP blade journals



(d_1 and d_2 = diameters)

Fig. 9.1.6
Severity zones for controllable pitch propeller hub

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.8.10 On completion of machining and grinding, the whole surface of each casting is to be subjected to a dye penetrant inspection in accordance with a procedure acceptable to LR.

1.8.11 All dye penetrant inspections on Zone A areas in the finished condition are to be made in the presence of the Surveyor.

1.8.12 Dye penetrant inspections on Zones B and C are to be performed by the manufacturer and may be witnessed at the Surveyor's request.

1.8.13 The surface to be inspected shall be divided into reference areas of 100 cm^2. The indications detected shall, with respect to their size and number, not exceed the values given in Table 9.1.3. The area shall be taken in the most unfavourable location relative to the indication being evaluated.

1.8.14 Indications exceeding the acceptance standard in Table 9.1.3 shall be repaired in accordance with 1.9.

1.8.15 All defects requiring repair by welding in new propeller castings are to be recorded on sketches showing their locations and dimensions. Copies of these sketches are to be presented to the Surveyor prior to repair.

1.8.16 Where repairs have been made either by grinding or welding, the repaired areas are to be subjected to dye penetrant inspection in the presence of the Surveyor, regardless of their location.

1.8.17 Where no welds have to be made on a casting, the manufacturer is to provide the Surveyor with a statement that this is the case.

1.8.18 Where it is suspected that a casting contains internal defects, radiographic and/or ultrasonic examination may be required by the Surveyor. The acceptance criteria are to be agreed between the manufacturer and LR in accordance with a recognised standard. The standard ASTM E272-99 (Severity Level 2) or equivalent is to be the radiographic acceptance standard for copper alloy castings. Ultrasonic testing of Cu 1 and Cu 2 is not considered in these Rules. For Cu 3 and Cu 4, ultrasonic inspection of defects may be possible and is to comply with the requirements for steel castings.

1.8.19 The measurement of dimensional accuracy is the responsibility of the manufacturer but the report on dimensional inspection is to be presented to the Surveyor who may require checks to be made and to witness such checks.

1.8.20 Static balancing is to be carried out on all propellers in accordance with the approved plan. Dynamic balancing is necessary for propellers running above 500 rpm.

1.9 Rectification of defective castings

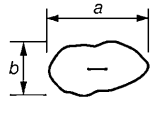
1.9.1 The rectification of defective propeller and propeller blade castings is to be carried out in accordance with the requirements given in 1.9.2 to 1.9.12.

Table 9.1.3 Allowable number and size of dye penetrant indications in a reference area of 100 cm^2 (*see* Note 1)

Severity Zones	Max. total number of indications	Type of indications (*see* Note 2)	Max. number of each type (*see* Notes 3 and 4)	Max. acceptable value for 'a' or 'l' of indications (mm) (*see* Note 2)
A	7	Non-linear Linear Aligned	5 2 2	4 3 3
B	14	Non-linear Linear Aligned	10 4 4	6 6 6
C	20	Non-linear Linear Aligned	14 6 6	8 6 6

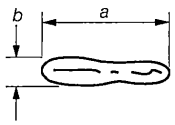
NOTES

1. The reference area is defined as an area of 0,1 m^2, which may be square or rectangular, with the major dimension not exceeding 250 mm. The area shall be taken in the most unfavourable location relative to the indication being evaluated.
2. Non-linear, linear and aligned indications are defined as follows:



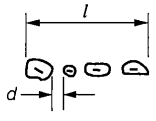
$\frac{a}{b} < 3$

non-linear



$\frac{a}{b} \geq 3$

linear



$d \leq 2$ mm

aligned

3. Only indications that have any dimension greater than 1,5 mm shall be considered relevant.
4. Single non-linear indications less than 2 mm in Zone A and less than 3 mm in other zones may be disregarded.
5. The total number of non-linear indications may be increased to the maximum total number, or part thereof, represented by the absence of linear or aligned indications.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.9.2 The rectification of small indications within the acceptance standard of Table 9.1.3 is not generally required except where they occur in closely spaced groups.

1.9.3 Where, in the surface of the end face or bore of a propeller boss, local pores are present which do not themselves adversely affect the strength of the casting, they may be filled with a suitable plastic filler after the appropriate preparation of the defective area. The foundry is to maintain records and details of all castings which have been so rectified.

1.9.4 Where unacceptable defects are found in a casting, they are to be removed by mechanical means, and the surfaces of the resulting depressions are subsequently to be ground smooth. Complete elimination of the defects is to be proved by adequate dye penetrant inspection.

1.9.5 Shallow grooves or depressions resulting from the removal of defects may, at the discretion of the Surveyor, be accepted provided that they will cause no appreciable reduction in the strength of the castings and that they are suitably blended by grinding.

1.9.6 Welded repairs are to be undertaken only when they are considered to be necessary and approved by the Surveyor. In general, welds having an area less than 5 cm^2 are to be avoided.

1.9.7 All weld repairs are to be carried out in accordance with qualified procedures by suitably qualified welders, and are to be completed to the satisfaction of the Surveyor. Records are to be made available to the Surveyor.

1.9.8 Welding is generally not permitted in Zone A and will only be allowed after special consideration.

1.9.9 Prior approval by the Surveyor is required for any welds in Zone B. Complete details of the repair procedure are to be submitted for each case.

1.9.10 Repair by welding is allowed in Zone C provided that there is compliance with 1.9.6 and 1.9.7.

1.9.11 The maximum area of any single repair and the maximum total area of repair in any one zone or region are given in Table 9.1.4.

1.9.12 Where it is proposed to exceed the areas given in Table 9.1.4, the nature and extent of the repair work are to be approved by the Surveyor before commencement of the repair.

Table 9.1.4 Permissible rectification of new propellers by welding

Severity zone or region	Maximum individual area of repair	Maximum total area of repairs
Zone A	Weld repairs not generally permitted	
Zone B	60 cm^2 or 0,6% x S whichever is the greater	200 cm^2 or 2% x S, whichever is the greater in combined Zones B and C but not more than 100 cm^2 or 0,8% x S, whichever is the greater, in Zone B on the pressure side
Zone C		
Other regions (*see* Note)	17 cm^2 or 1,5% area of the region whichever is the greater	50 cm^2 or 5% x area of the region whichever is the greater

where S = area of one side of a blade = $0{,}79 \frac{D^2 B}{N}$

D = finished diameter of propeller
B = developed area ratio
N = number of blades

NOTE
Other regions include:
(a) the bore;
(b) the forward and aft faces of the boss;
(c) the outer surface of the boss to the start of the blade root fillets;
(d) the inner face of a CPP blade palm;
(e) all surfaces of CPP nose cones;
(f) the surfaces of integral journals to CPP blades other than the fillets.

1.10 Weld repair procedure

1.10.1 Welding is to be carried out under cover in positions free from draughts and adverse weather conditions.

1.10.2 The manufacturer is to submit a detailed welding procedure specification covering the weld preparation, welding parameters, filler metal, preheating, post-weld heat treatment and inspection procedures.

1.10.3 Before welding is started, Welding Procedure Qualification tests are to be carried out and witnessed by the Surveyor. Each welder is to be qualified to carry out the proposed welding using the same process, consumable and position which are to be used for the repair.

1.10.4 Defects to be repaired by welding are to be removed completely by mechanical means (e.g. grinding, chipping or milling). Removal of defects in accordance with the requirements for Zone A is to be demonstrated by dye penetrant inspection in the presence of the Surveyor. The excavation is to be prepared in a manner which will allow good fusion and is to be clean and dry.

1.10.5 Metal arc welding with the electrodes or filler wire used in the procedure tests is to be used for all types of repairs. Welds should preferably be made in the downhand (flat) position. Where necessary, suitable preheat is to be applied before welding, and the preheat temperature is to be maintained until welding is completed.

1.10.6 When flux coated electrodes are used they are to be dried immediately before use, in accordance with the manufacturer's instructions.

1.10.7 All slag, undercuts and other defects are to be removed before the subsequent run is deposited.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.10.8 With the exception given in 1.10.9, all weld repairs in areas of solid propellers exposed to sea-water, and all repairs to separately cast blades, are to be stress relief heat treated.

1.10.9 Stress relief heat treatment is not mandatory after welding Grade Cu 3 castings in Zone C unless a welding consumable susceptible to stress corrosion (e.g. complying with the composition range of Grade Cu 4) is used. All welds in Zones A and B however, must be stress relieved by heat treatment, regardless of alloy.

1.10.10 Propeller and propeller blades are to be stress relieved within the following temperature ranges:

alloy Grades Cu 1 and Cu 2	350°C to 550°C
alloy Grade Cu 3	450°C to 500°C
alloy Grade Cu 4	450°C to 600°C

Soaking times are to be in accordance with Table 9.1.5, and subsequent cooling from the soaking temperature is to be suitably controlled to minimise residual stresses and is not to exceed 50°C per hour until the temperature is below 200°C. Care should be taken to avoid heating castings in the Grade Cu 3 alloy at temperatures between 300° and 400°C for prolonged periods.

Table 9.1.5 Soaking times for stress relief heat treatment of copper alloy propellers

Stress relief temperature °C (*see* Notes)	Alloy Grade Cu1 and Cu2		Alloy Grade Cu3 and Cu4	
	Hours per 25 mm of thickness	Maximum recommended total time hours	Hours per 25 mm of thickness	Maximum recommended total time hours
350	5	15	—	—
400	1	5	—	—
450	1/2	2	5	15
500	1/4	1	1	5
550	1/4	1/2	1/2	2
600	—	—	1/4	1

NOTES
1. Treatment at 550°C is not applicable to alloy Grade Cu3.
2. Treatment at 600°C is only applicable to alloy Grade Cu4.

1.10.11 Stress relief heat treatment is to be carried out, where possible, in furnaces having suitable atmosphere and temperature control. Sufficient thermocouples are to be attached to the casting to measure the temperature at positions of extremes of thickness.

1.10.12 As an alternative to 1.10.11, local stress relief heat treatment may be accepted, provided that the Surveyor is satisfied that the technique will be effective and that adequate precautions are taken to prevent the introduction of detrimental temperature gradients. Where local stress relief heat treatment is approved, adequate temperature control is to be provided. The area of the propeller or blade adjacent to the repair is to be suitably monitored and insulated to ensure that the required temperature is maintained and that temperature gradients are moderate. Care should be taken to select the shape of an area to be heat treated which will minimise residual stresses.

1.10.13 On completion, welds are to be ground smooth for visual examination and dye penetrant inspection. Where a propeller or propeller blade is to be stress relief heat treated, a visual examination is to be made before heat treatment, and both visual and dye penetrant examinations are to be made after the stress relief heat treatment. Irrespective of location, all weld repairs are to be assessed according to Zone A in Table 9.1.3.

1.10.14 The foundry is to maintain full records detailing the weld procedure, heat treatment and extent and location on drawings of repairs made to each casting. These records are to be available for review by the Surveyor, and copies of individual records are to be supplied to the Surveyor on request.

1.10.15 LR reserves the right to restrict the amount of repair work accepted from a manufacturer when it appears that repetitive defects are the result of improper foundry techniques or practices.

1.11 Identification

1.11.1 Castings are to be clearly marked by the manufacturer in accordance with the requirements of Chapter 1. The following details are to be shown on all castings which have been accepted:

(a) Identification mark which will enable the full history of the item to be traced.
(b) Alloy grade.
(c) LR or Lloyd's Register and the abbreviated name of LR local office.
(d) Personal stamp of Surveyor responsible for the final inspection.
(e) Date of final inspection.
(f) Skew angle, if in excess of 25°. *See* Pt 5, Ch 7,1 of the Rules for Ships for the definition of skew angle.

1.12 Certification of materials

1.12.1 A LR certificate is to be issued for each propeller, *see* Ch 1,3.1

1.12.2 The manufacturer is to provide the Surveyor with the following particulars for each casting:

(a) Purchaser's name and order number.
(b) Description of casting.
(c) Alloy designation and/or trade name.
(d) Identification number of casting.
(e) Cast identification number if different from (d).
(f) Details of heat treatment, where applicable.
(g) Skew angle, if in excess of 25°. *See* the relevant Rules for the definition of skew angle.
(h) Final weight of casting.
(j) Results of non-destructive tests and details of test procedures.
(k) Proportion of alpha-structure for Cu1 and Cu2 alloys.
(l) Results of mechanical tests.
(m) A sketch showing the location and extent of welding repairs (if any).

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

■ *Section 2*
Castings for valves, liners and bushes

2.1 Scope

2.1.1 This Section makes provision for copper alloy castings for valves, liners, bushes and other fittings intended for use in the construction of ships, other marine structures, machinery and pressure piping systems.

2.1.2 Castings are to be manufactured and tested in accordance with Chapters 1 and 2, and also with the requirements given in this Section.

2.1.3 As an alternative to 2.1.2, castings which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of Chapter 1.

2.2 Manufacture

2.2.1 Castings are to be manufactured at foundries approved by LR.

2.3 Quality of castings

2.3.1 All castings are to be free from surface or internal defects which would be prejudicial to their proper application in service.

2.4 Chemical composition

2.4.1 The chemical composition is to comply with the requirements of a National or International Standard and, where appropriate, with the limits for the principal elements of the preferred alloys listed in Tables 9.2.1 and 9.2.2.

2.4.2 With the exception given in 2.4.3, chemical analysis is required on each cast.

2.4.3 Where a cast is wholly prepared from ingots for which an analysis is already available, and provided that no significant alloy additions are made during melting, the ingot maker's certified analysis can be accepted subject to occasional check tests as requested by the Surveyor. The frequency of these check tests should, as a minimum, be one in every ten casts. If one of these check analyses fails to comply with the specification, checks are to be made on the previous and subsequent melts. If one or both of these further analyses is unsatisfactory, chemical analysis is to be carried out on all further melts until the Surveyor is satisfied that a return can be made to the use of occasional check tests.

2.5 Heat treatment

2.5.1 Where required by the specification, castings may be supplied in either the 'as-cast' or heat treated condition.

2.5.2 Where castings are supplied in a heat treated condition, the test samples are to be heat treated with the castings they represent prior to the preparation of the tensile test specimens.

2.6 Test material

2.6.1 Test material sufficient for the tests specified in 2.6.4 and for possible re-test purposes is to be provided for each cast of material.

2.6.2 The test material is to be separately cast into moulds made of the same material as that used for the castings they represent.

2.6.3 For the alloys listed in Table 9.2.1, sand cast test bars are generally to be in accordance with Fig. 9.2.1.

2.6.4 For the alloys listed in Table 9.2.2, keel block type test samples are to be in accordance with Fig. 9.1.1.

Table 9.2.1 Chemical compositions of long freezing range alloys: principal elements only

Alloy type	Designation	Chemical composition						Typical applications
		Cu	Sn	Zn	Pb	Ni	P	
Phosphor bronze	Cu Sn11P Cu Sn12	87,0 – 89,5 85,0 – 88,5	10,0 – 11,5 11,0 – 13,0	0,05 max. 0,50 max.	0,25 max. 0,7 max.	0,10 max. 2,0 max.	0,5 – 1,0 0,60 max.	Liners, bushes, valves and fittings

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 9.2.2 Chemical compositions of short freezing range alloys: principal elements only

Alloy type	Designation	Chemical composition								Typical applications
		Cu	Ni	Fe	Mn	Cr	Nb	Si	Al	
Copper 30% nickel	Cu Ni30 Fe1 Mn1	64,5 min.	29,0–31,0	0,5–1,5	0,6–1,2	–	–	0,1 max.	–	Flanges, valves and fittings
	Cu Ni30 Fe1 Mn1 Nb Si	Remainder	29,0–31,0	0,5–1,5	0,6–1,2	–	0,5–1,0	0,3–0,7	–	
	Cu Ni30 Cr2 Fe Mn Si (*see* Note 1)	Remainder	29,0–32,0	0,5–1,0	0,5–1,0	1,5–2,0	–	0,15–0,50	–	
Copper 10% nickel	Cu Ni10 Fe1 Mn1	84,5 min.	9,0–11,0	1,0–1,8	1,0–1,5	–	1,0 max.	0,10 max.	–	Flanges, valves and fittings
Aluminium bronze	Cu Al10 Fe5 Ni5	76,0–83,0	4,0–6,0 (*see* Note 2)	4,0–5,5 (*see* Note 2)	3,0 max.	–	–	0,1 max.	8,5–10,5	Bushes, valves and fittings
	Cu Al11 Fe6 Ni6	72,0–78,0	4,0–7,5 (*see* Note 2)	4,0–7,0 (*see* Note 2)	2,5 max.	–	–	0,1 max.	10,0–12,0	

NOTES
1. Normally alloy Cu Ni30 Cr2 Fe Mn Si contains 0,1 to 0,25% titanium and 0,05 to 0,15% zirconium.
2. For Naval ships, the nickel content is to be higher than the iron content.

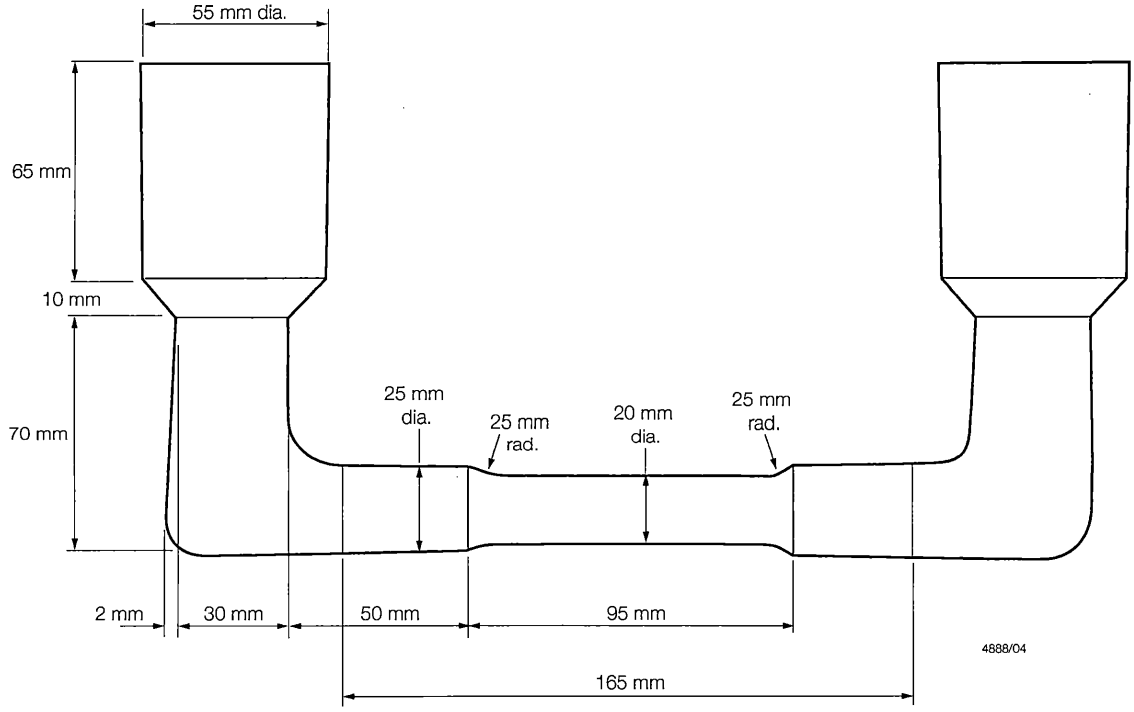

Fig. 9.2.1 Sand cast test bars for long freezing range alloys

2.6.5 If it is proposed to use any other form of test bar, this is to be agreed in advance with the Surveyor.

2.6.6 As an alternative, for liners and bushes, the test material may be taken from the ends of the castings.

2.7 Mechanical tests

2.7.1 A tensile test specimen is to be prepared from each test sample. The dimensions of the specimens are to comply with Fig. 2.2.1 or Fig. 2.2.2 in Chapter 2.

2.7.2 The results of all tests are to comply with the appropriate requirements given in Tables 9.2.3 and 9.2.4.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 9.2.3 Mechanical properties of long freezing range alloys for acceptance purposes

Alloy type	Designation	0,2% proof stress N/mm² minimum (*See* Note 1)		Tensile strength N/mm² minimum		Elongation on $5{,}65\sqrt{S_o}$ % minimum	
		Sand	Centrifugal	Sand	Centrifugal	Sand	Centrifugal
Phosphor bronze	Cu Sn11 P	130	170	250	330	5	4
	Cu Sn12	140	150	260	280	7	5
Gunmetal	Cu Sn10 Zn2	130	130	270	250	13	5
Leaded gunmetal	Cu Sn5 Zn5 Pb5	90	110	200	250	13	13
	Cu Sn7 Zn2 Pb3	130	130	230	260	14	12
	Cu Sn7 Zn4 Pb7	120	120	230	260	15	12
	Cu Sn6 Zn4 Pb2	110	110	220	240	15	12
Leaded bronze	Cu Sn10 Pb10	80	110	180	220	8	6
	Cu Sn5 Pb9	60	90	160	200	7	6
	Cu Sn7 Pb15	80	90	170	200	8	7
	Cu Sn5 Pb20	70	80	150	170	5	6

NOTES
1. The 0,2% proof stress values are given for information purposes only and, unless otherwise agreed, are not required to be verified by test.
2. Castings may be supplied in the chill cast condition in which case the mechanical properties requirements are to be in accordance with a specification agreed by LR.

Table 9.2.4 Mechanical properties of short freezing range alloys for acceptance purposes

Alloy type	Designation	0,2% proof stress N/mm² minimum (*See* Note 1)		Tensile strength N/mm² minimum		Elongation on $5{,}65\sqrt{S_o}$ % minimum	
		Sand	Centrifugal	Sand	Centrifugal	Sand	Centrifugal
Copper 30% Nickel	Cu Ni30 Fe1 Mn1	120	120	340	340	18	18
	Cu Ni30 Fe1 Mn1 Nb Si	230	—	440	—	18	—
	Cu Ni30 Cr2 Fe Mn Si	250	—	440	—	18	—
Copper 10% Nickel	Cu Ni10 Fe1 Mn1	120	100	280	280	20	25
Aluminium Bronze	Cu Al10 Fe5 Ni5	250	280	600	650	13	13
	Cu Al11 Fe6 Ni6	320	380	680	750	5	5

2.8 Inspection

2.8.1 All castings are to be cleaned and adequately prepared for inspection. Before acceptance, all castings are to be presented to the Surveyor for visual examination. This is to include the examination of internal surfaces, where applicable.

2.8.2 For valves and other pressure components, dye penetrant inspection is required and the Surveyor is to witness the tests. Unless otherwise agreed, the acceptance criteria to be applied are to meet the requirements of Table 9.2.5, or equivalent.

2.8.3 The accuracy and verification of dimensions are the responsibility of the manufacturer. However, the report on dimensional inspection is to be presented to the Surveyor who may request to witness confirmatory measurements.

Table 9.2.5 Visual and surface NDE acceptance criteria for valves and pressure components

Defect type	Acceptance criteria for visual and surface NDE, *see* Note
Linear indications	Not permitted
Porosity	Individual pores are not to exceed 3 mm diameter bleed out, and the sum of the diameters of all indications in an area of 70 x 70 mm is not to exceed 24 mm²

NOTE
Inspection is to be in accordance with a procedure acceptable to LR.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2.9 Rectification of defective castings

2.9.1 Subject to the prior approval of the Surveyor, castings containing local porosity may be rectified by impregnation with a suitable plastic filler provided that the extent of the porosity is such that it does not adversely affect the strength of the casting.

2.9.2 Proposals to repair a defective casting by welding are to be submitted to the Surveyor before this work is commenced. The Surveyor is to be satisfied that the number, position and size of the defects are such that the castings can be efficiently repaired.

2.9.3 Where approval is given for the repair by welding, complete elimination of the defects is to be proven by adequate non-destructive testing.

2.9.4 All welding is to be in accordance with an approved and qualified weld procedure and carried out by a qualified welder.

2.9.5 A statement and/or sketch detailing the extent and position of all weld repairs is to be prepared by the manufacturer as a permanent record. These records are to be available for review by the Surveyor, and copies of individual records are to be supplied to the Surveyor on request.

2.9.6 The alloys listed in Table 9.2.1 are not satisfactory for repair by welding which is generally not permitted. Weld repairs may, however, be considered in special circumstances provided that a suitable procedure, with proof of previous satisfactory repairs is submitted to the Surveyor.

2.9.7 The welding during manufacture of liners is not permitted in any alloy containing more than 0,5 per cent lead.

2.10 Pressure testing

2.10.1 Where required by the relevant Rules, castings are to be pressure tested before final acceptance. Unless otherwise agreed, these tests are to be carried out in the presence of the Surveyors and are to be to their satisfaction.

2.11 Identification

2.11.1 The manufacturer is to adopt a system of identification which will enable all finished castings to be traced to the original cast, and the Surveyor is to be given full facilities for tracing the casting when required.

2.11.2 Before acceptance, all castings which have been tested and inspected with satisfactory results are to be clearly marked by the manufacturer with the following details:

(a) Identification number, cast number or other markings which will enable the full history of the casting to be traced.
(b) LR or Lloyd's Register and the abbreviated name of LR's local office.
(c) Personal stamp of the Surveyor responsible for inspection.
(d) Test pressure, where applicable.
(e) Date of final inspection.

2.11.3 Where small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with the Surveyor.

2.12 Certification of materials

2.12.1 A LR certificate is to be issued, *see* Ch 1,3.1.

2.12.2 The manufacturer is to provide the Surveyor with the following particulars for each casting or batch of castings which has been accepted:

(a) Purchaser's name and order number.
(b) Description of castings and alloy grade.
(c) Identification number.
(d) Ingot or cast analysis.
(e) Full details of heat treatment, where applicable.
(f) Mechanical test results.
(g) Test pressure, where applicable.

2.12.3 In addition to 2.12.2, the manufacturer is to provide, where applicable, a statement and/or sketch detailing the extent and position of all weld repairs made to each casting.

■ *Section 3* Tubes

3.1 Scope

3.1.1 Provision is made in this Section for seamless copper and copper alloy tubes intended for use in condensers, heat exchangers and pressure piping systems.

3.1.2 Tubes for Class I and II pressure systems (as defined in the relevant Rules) are to be manufactured and tested in accordance with the requirements of Chapters 1 and 2 and the requirements of this Section.

3.1.3 As an alternative to 3.1.2, tubes which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of Chapter 1.

3.1.4 Tubes for Class III pressure systems are to be manufactured and tested in accordance with the requirements of a National or International Standard recognised by LR. The manufacturer's test certificate will be acceptable and is to be provided for each batch of material.

3.2 Manufacture

3.2.1 Tubes for Class I and II pressure systems are to be manufactured at a works approved by LR for the grade of material being supplied.

3.2.2 Tubes for Class III pressure systems are not required to be manufactured at a works approved by LR.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

3.3 Quality

3.3.1 Tubes are to be clean and free from surface and internal defects and residues from manufacturing operations.

3.3.2 The tubes are to be supplied in smooth, round, straight lengths, free from deleterious films in the bore. The ends are to be cut clean and square with the axis of the tube and are to be de-burred.

3.4 Dimensional tolerances

3.4.1 The tolerances on the wall thickness and diameter of the tubes are to be in accordance with a National or International Standard recognised by LR.

3.4.2 The measurement of dimensional accuracy and compliance with the specification are the responsibility of the manufacturer, but the reports are to be made available to the LR Surveyors, who may require checks to be made in their presence.

3.5 Chemical composition

3.5.1 The chemical composition is to comply with the requirements of a National or International Standard recognised by LR and comply with the base limits for the principal elements given in Table 9.3.1.

3.6 Heat treatment

3.6.1 Copper-phosphorus and aluminium brass tubes are to be supplied in the annealed condition. Aluminium brass tubes may additionally be required to be given a suitable stress relieving heat treatment when subjected to a cold straightening operation after annealing.

3.6.2 Tubes in the copper-nickel iron alloys are to be supplied in a solution heat treated condition to ensure that no iron rich phases are present.

3.7 Mechanical tests

3.7.1 Tubes are to be presented for test in batches of 300 lengths. A batch is to consist of tubes of the same size, manufactured from the same material grade.

3.7.2 At least one length is to be selected at random from each batch and subjected to the following tests:
(a) Tensile test.
(b) Flattening test.
(c) Drift expanding test.

3.7.3 The procedures for mechanical tests and the dimensions of the test specimens are to be in accordance with Chapter 2.

3.7.4 The flattening test is to be continued until the interior surfaces of the tube meet.

3.7.5 For the drift expanding test, the mandrel is to have an included angle of 45°.

3.7.6 The results of all mechanical tests are to comply with the appropriate requirements given in Table 9.3.2.

3.7.7 At the discretion of the Surveyor, a modified testing procedure may be adopted for small quantities of materials. In such cases, these may be accepted on the manufacturer's declared chemical composition and hardness tests or other evidence of satisfactory properties.

Table 9.3.1 Chemical composition of principal elements only

Designation	Chemical composition %								
	Cu	As	P	Fe	Pb	Ni	Al	Mn	Zn
Copper-phosphorus deoxidised–non-arsenical	99,85 min.	–	0,013–0,050	—	—	—	—	—	—
Copper-phosphorus deoxidised–arsenical	99,2 min.	0,30–0,50	0,013–0,050		—	—	—	—	—
Aluminium brass	76,0–79,0	0,02–0,06	—	0,06 max.	0,07 max.	—	1,8–2,5	—	Remainder
90/10 Copper-nickel-iron (*see* Note)	Remainder	—	—	1,0-2,0	—	9,0–11,0	—	0,5–1,0	—
70/30 Copper-nickel-iron (*see* Note)	Remainder	—	—	0,40–1,00	—	29,0–33,0	—	0,5–1,5	—

NOTE
Where the purchaser specifies that the product is intended for subsequent welding applications, the following limits will apply:

Zn	0,50% max.	S	0,02% max.
Pb	0,02% max.	C	0,05% max.
P	0,02% max.		

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 9.3.2 Mechanical properties for acceptance purposes

Designation	0,2% proof stress N/mm^2 minimum	Tensile strength N/mm^2 minimum	Elongation on $5{,}65\sqrt{S_o}$ % minimum	Drift expansion test % minimum	Grain size mm maximum (*see* Note)
Copper-phosphorus deoxidised–non-arsenical	65	220	40	40	—
Copper-phosphorus deoxidised–arsenical	65	220	40	40	—
Aluminium brass	125	320	40	30	0,045
90/10 Copper-nickel-iron	100	270	30	30	0,045
70/30 Copper-nickel-iron	120	360	30	30	0,045

NOTE
When a maximum grain size is specified, the structure is to be completely re-crystallised. The manufacturer is to guarantee the grain size, but testing of each batch will not be required.

3.8 Visual examination

3.8.1 All tubes are to be visually examined. The manufacturer is to provide adequate lighting conditions to enable an internal and external examination of the tubes to be carried out.

3.8.2 The inner and outer surfaces are to be clean and smooth but may have a superficial, dull iridescent film on both the inner and outer surfaces.

3.9 Stress corrosion cracking test

3.9.1 This is an accelerated test for detecting the presence in tubes of internal stresses which might result in failure, in storage or in service, due to stress corrosion cracking.

3.9.2 The test is applicable only to aluminium brass and copper-nickel-iron tubes.

3.9.3 The test specimen is to consist of a 150 mm length cut from the tube selected for mechanical tests in accordance with 3.7.2.

3.9.4 The test is to be carried out in accordance with a National or International Standard recognised by LR or by the test method given in 3.9.5.

3.9.5 The test specimen is to be immersed in a mercurous nitrate solution at room temperature for 30 minutes. Aluminium brass specimens are to be examined for cracks immediately after rinsing, while copper-nickel-iron specimens are to be examined 24 hours after rinsing.

3.9.6 Should any specimen fail to meet the requirements of this test, then all tubes represented by that specimen are to be withdrawn. The tubes may be re-submitted after stress relieving treatments for full testing in accordance with 3.7 and 3.9.

3.10 Hydraulic test

3.10.1 Each tube is to be subjected to a hydraulic test at the manufacturer's works.

3.10.2 The hydraulic test pressure is to be determined from the following formula, except that the maximum test pressure need not exceed 70 bar:

$$P = \frac{20st}{D}$$

where

P = test pressure, in bar
D = nominal outside diameter, in mm
t = nominal wall thickness, in mm
s = 40 for copper-phosphorus
60 for Al-brass and
90/10 copper nickel iron
75 for 70/30 copper nickel iron.

3.10.3 The test pressure is to be maintained for sufficient time to permit proof that the tubes do not weep, leak or undergo a permanent increase in diameter. Unless otherwise agreed, the manufacturer's certificate of satisfactory hydraulic test will be accepted.

3.10.4 Where it is proposed to adopt a test pressure other than that determined in 3.10.2, the proposal will be subject to special consideration.

3.10.5 Subject to special approval, an automated eddy current test can be accepted in lieu of the hydraulic test. Discontinuous irregularities on the external and internal surfaces of the tubes are permitted if they are within the agreed dimensional tolerances, with the exception of cracks, which are not permitted.

3.11 Rectification of defects

3.11.1 The repair of defects by welding is not permitted.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

3.12 Identification

3.12.1 Tubes are to be clearly marked by the manufacturer in accordance with the requirements of Chapter 1. The following details are to be shown on all materials which have been accepted:

(a) LR or Lloyd's Register.
(b) Manufacturer's name or trade mark.
(c) Grade of material or designation code.
(d) Identification number and/or initials which will enable the full history of the item to be traced.

3.12.2 Identification is to be by rubber stamp or stencils. Hard stamping is not permitted.

3.13 Certification of materials

3.13.1 A manufacturer's certificate validated by LR is to be issued (*see* Ch 1,3.1), giving the following particulars for each casting or batch of castings which has been accepted:

(a) Purchaser's name and order number.
(b) Specification or grade of material.
(c) Description and dimensions.
(d) Cast number and chemical composition.
(e) Mechanical test results.
(f) Results of stress corrosion cracking test, where applicable.
(g) Hydraulic test report.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Equipment for Mooring and Anchoring

Chapter 10

Section 1

Section

1 **Anchors**

2 **Stud link chain cables for ships**

3 **Stud link mooring chain cables**

4 **Studless mooring chain cables**

5 **Short link chain cables**

6 **Steel wire ropes**

7 **Fibre ropes**

Section 1 Anchors

1.1 Scope

1.1.1 This Section makes provision for the manufacture and testing of anchors constructed from cast, forged and fabricated components.

1.1.2 This Section is applicable to the following types of anchor:
(a) Ordinary.
(b) High holding power (HHP).
(c) Super high holding power (SHHP).

1.1.3 In the context of this Section, the reference to swivels refers to those directly attached to the anchor shank in lieu of the conventional 'D' shackle. For other mooring equipment swivels, *see* 2.13.

1.2 Manufacture

1.2.1 All anchors are to be of an approved design.

1.3 Cast steel anchors

1.3.1 Cast steel anchor heads, shanks, shackles and swivels are to be manufactured and tested in accordance with the requirements of Ch 4,1 and Ch 4,2. The Special grade quality is to be used for anchor heads, shanks and shackles.

1.3.2 Special consideration will be given to the use of other grades of steel for the manufacture of swivels.

1.3.3 To confirm the quality of cast anchor components, the Surveyor is to witness drop and hammering tests.

1.3.4 When drop and hammering tests are required, they are to be carried out as follows:
(a) Each anchor, or the components of an anchor made from more than one piece, is to be dropped from a clear height of 4 m onto a steel slab laid on a solid foundation.
(b) Separately cast flukes, shanks and shackles are to be suspended horizontally from a clear height of 4 m before being dropped.
(c) Anchors cast in one piece are to be drop tested twice from a clear height of 4 m. For the first test, the shank and flukes are to be horizontal. For the second test, two steel blocks are to be placed on the slab, arranged so that the middle of each fluke makes contact with the blocks without the crown making contact with the slab, and the orientation of the anchor is to be vertical with the crown nearest the slab.
(d) If the slab is broken by the impact, the test is to be repeated on a new slab.

1.3.5 When hammering tests are required, they are to be carried out after the drop test on each anchor head and shank, which is slung clear of the ground, using a non-metallic sling, and hammered to check the soundness of the component. A hammer of at least 3 kg mass is to be used.

1.3.6 As part of the manufacturer's works approval, consideration may be given to carrying out drop tests in alternative locations to the manufacturer's when the facilities and location are not suitable.

1.3.7 Repair of fractures or unsoundness detected during the drop or hammering tests are not permitted and the component is to be rejected.

1.4 Forged steel anchors

1.4.1 Forged steel anchor pins, swivels, shanks and shackles are to be manufactured and tested in accordance with the requirements of Ch 5,1 and Ch 5,2 carbon and carbon-manganese steel for welded construction. Rolled steel bar may be used provided that the requirements of Ch 5,1.2.9 are met.

1.4.2 Special consideration will be given to other grades of steel for the manufacture of swivels.

1.5 Fabricated steel anchors

1.5.1 Where it is proposed to use plate material for fabricated steel anchors, it is to comply with the requirements of Ch 3,2 or Ch 3,3, and the proposed manufacturing procedure is to be submitted for approval.

1.5.2 Fabricated anchors are to be manufactured in accordance with Chapter 13.

1.5.3 Stress relief is to be carried out as required in the approved welding procedure.

1.6 Rectification

1.6.1 All rectification is to be agreed with the Surveyor.

1.6.2 Rectification of defective castings is to be carried out in accordance with Ch 4,1.9.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.6.3 Rectification of defective forgings is to be carried out in accordance with Ch 5,1.9.

1.6.4 Rectification of defective fabricated anchors is to be carried out by suitably qualified welders within the parameters of the approved welding procedure used in construction.

1.6.5 Rectification of defective castings, forgings or fabricated anchors by welding is to be carried out using qualified weld procedures in accordance with Ch 12,1 and Ch 12,2, and in accordance with Ch 13,1 and Ch 13,2.

1.7 Super high holding power (SHHP) anchors

1.7.1 The impact test requirements for SHHP anchor shackles are to be in accordance with the requirements for Grade U3 in Table 10.2.1.

1.8 Assembly

1.8.1 Assembly and fitting is to be carried out in accordance with the approved design.

1.8.2 Securing of anchor pins, shackle pins or swivels by welding is to be carried out by suitably qualified welders in accordance with an approved welding procedure.

1.9 Proof test of anchors

1.9.1 Anchors having a mass of 75 kg or more inclusive of stock (56 kg in the case of high holding power anchors) are to be tested in the presence of the Surveyor at a proving establishment recognised by LR. A list of recognised proving establishments is published separately by LR. In addition to the requirements stated in this Chapter, attention must be given to any relevant statutory requirements of the National Authority of the country in which the ship or mobile offshore unit is to be registered.

1.9.2 The anchor is to be visually examined before application of the proof test load to ensure that it is free from cracks, notches, inclusions and other surface defects that would impair the performance of the product.

1.9.3 As required by 1.9.1, each anchor is to be subjected to a proof loading test in an approved testing machine and is to withstand the load given in Table 10.1.1 for the appropriate mass of the anchor. The proof load is to be applied on the arm or on the palm at a spot which, measured from the extremity of the bill, is one-third of the distance between it and the centre of the crown. For stocked anchors, each arm is to be tested individually. For stockless anchors, both arms are to be tested at the same time, first on one side of the shank, then reversed and tested on the other.

Table 10.1.1 Proof load tests for anchors
(*see* Notes 1 and 2)

Mass of anchor (1.6.5) kg	Proof test load kN	Mass of anchor (1.6.5) kg	Proof test load kN	Mass of anchor (1.6.5) kg	Proof test load kN
50	23,2	2200	376,0	7800	861,0
55	25,2	2300	388,0	8000	877,0
60	27,1	2400	401,0	8200	892,0
65	28,9	2500	414,0	8400	908,0

1300	247,0	6300	754,0	30 000	1990,0
1350	255,0	6400	760,0	31 000	2030,0
1400	262,0	6500	767,0	32 000	2070,0
1450	270,0	6600	773,0	34 000	2160,0
1500	278,0	6700	779,0	36 000	2250,0
1600	292,0	6800	786,0	38 000	2330,0
1700	307,0	6900	794,0	40 000	2410,0
1800	321,0	7000	804,0	42 000	2490,0
1900	335,0	7200	818,0	44 000	2570,0
2000	349,0	7400	832,0	46 000	2650,0
2100	362,0	7600	845,0	48 000	2730,0

Proof loads for intermediate mass are to be determined by linear interpolation

NOTES

1. Where ordinary anchors have a mass exceeding 48 000 kg, the proof loads are to be taken as 2,059 (mass of anchor in kg)$^{2/3}$ kN.
2. Where high holding power anchors have a mass exceeding 36 000 kg, the proof loads are to be taken as 2,452 (actual mass of anchor in kg)$^{2/3}$ kN.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.9.4 The general arrangements for the test are to be such that the complete anchor, including the shackle, shackle pins and any welded or bolted connections are included in the test. If a replacement shackle is needed which requires welding or heating for fitting, the combined anchor and shackle are to be proof load tested. If welding or heating is not involved in fitting, the shackle may be proof load tested separately from the anchor.

1.9.5 The mass to be used in Table 10.1.1 is:

(a) For stockless anchors, the total mass of the anchor.
(b) For stocked anchors, the mass of the anchor excluding the stock.
(c) For high holding power anchors, a nominal mass equal to 1,33 times the actual total mass of the anchor.
(d) For mooring anchors, including positional mooring anchors, a nominal mass equal to 1,33 times the actual total mass of the anchor, unless specifically agreed otherwise.
(e) For super high holding power anchors, a nominal mass equal to twice the actual total mass of the anchor.

1.9.6 For positional mooring anchors, the proof test loading is to be that required by 1.9.3 or 50 per cent of the minimum break strength of the intended anchor line, whichever is the greater.

1.9.7 The gauge length is to be measured with 10 per cent of the required load applied, before and after proof test. The two measurements shall differ by no more than 1 per cent. The gauge length is the distance between the tip of each fluke and a point on the shank adjacent to the shackle pin, *see* Fig. 10.1.1.

1.9.8 After proof testing, all accessible surfaces are to be visually inspected by the Surveyor.

1.9.9 Following proof testing, NDE is to be conducted as described in Table 10.1.2 for ordinary and HHP anchors and Table 10.1.3 for SHHP anchors.

1.9.10 Each casting is to be subjected to ultrasonic inspection in the region of runners and risers, or where excess material has been removed by thermal methods. This examination is to extend around the whole periphery of the casting and for a distance of $t/3$ beyond the area affected, where t is the maximum thickness. In addition, random areas are to be selected by the Surveyor and examined.

1.9.11 Acceptance criteria for castings are to be in accordance with Chapter 4.

1.9.12 Acceptance criteria for forgings are to be in accordance with Chapter 5.

1.9.13 Paint or anti-corrosive coatings are not to be applied until these inspections are completed to the satisfaction of the Surveyor.

Table 10.1.2 NDE requirements following proof testing for Ordinary and HHP anchors

Location	Method of NDE
Feeder heads, runners and risers of castings	Magnetic particle inspection and ultrasonic test, *see* Note 1
All welds	Magnetic particle inspection
Forged components	Not required
Fabrication welds	Magnetic particle inspection
NOTES 1. *See also* 1.9.10. 2. Penetrant testing is to be used in lieu of magnetic particle testing for stainless steel, aluminium and copper alloy anchors.	

Table 10.1.3 NDE requirements following proof testing for SHHP anchors

Location	Method of NDE
Feeder heads, runners and risers of castings	Magnetic particle inspection and ultrasonic test, *see* Note 1
All surfaces of castings	Magnetic particle inspection
All welds	Magnetic particle inspection
Forged components	Not required
Fabrication welds	Magnetic particle inspection
NOTES 1. *See also* 1.9.10. 2. Additionally, all surfaces of all SHHP anchors are to be surface inspected by the magnetic particle or penetrant method as appropriate. 3. Penetrant is to be used in lieu of magnetic particle testing for stainless steel, aluminium and copper alloy anchors.	

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

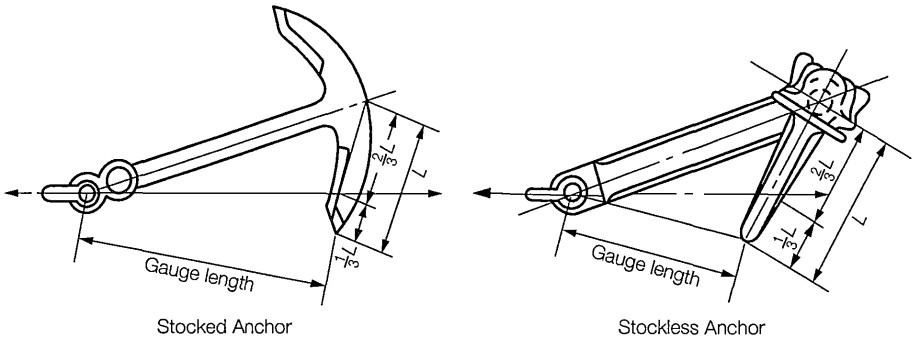

Fig. 10.1.1 Location of gauge length measurement during proof load

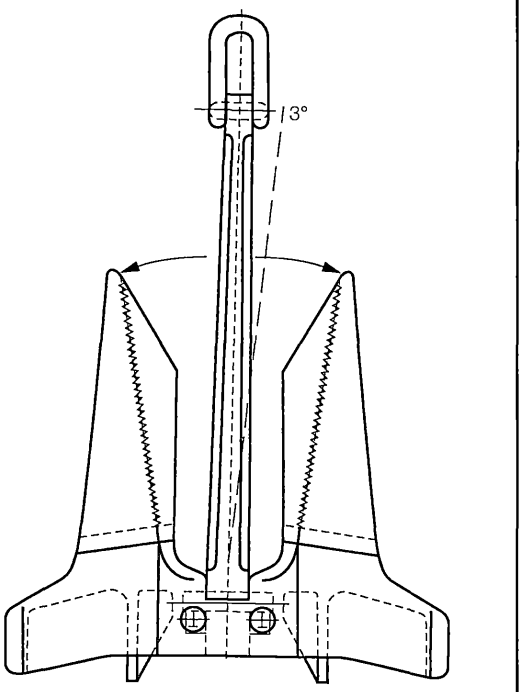

Fig. 10.1.2 Allowable lateral movement of shank

1.9.14 On completion of the proof testing, anchors made in more than one piece are to be examined for free movement of their heads over the complete range of rotation.

1.10 Clearances and tolerances

1.10.1 Where no fitting tolerances are specified on the approved plans the following assembly and fitting tolerance are to be applied.

1.10.2 The clearance either side of the shank within the shackle jaws and the shackle pin in the shank end hole is to be no more than 3 mm for small anchors up to 3 tonnes, 4 mm for anchors up to 5 tonnes, 6 mm for anchors up to 7 tonnes and is not to exceed 12 mm for larger anchors.

1.10.3 The shackle pin is to be a push fit in the eyes of the shackle, which are to be chamfered on the outside to ensure a good tightness when the pin is clenched over on fitting. The shackle pin to hole tolerance is to be no more than 0,5 mm for pins up to 57 mm and 1,0 mm for pins of larger diameter.

1.10.4 The trunnion pin is to be a snug fit within the chamber and be long enough to prevent horizontal movement. The gap is to be no more than 1 per cent of the chamber length.

1.10.5 The lateral movement of the shank is not to exceed 3 degrees from the centreline datum, *see* Fig. 10.1.2.

1.10.6 Unless otherwise agreed, the verification of mass and dimensions is the responsibility of the manufacturer. The Surveyor is only required to monitor this inspection. The mass of the anchor is to exclude the mass of the swivel, unless the swivel is in lieu of the conventional 'D' shackle.

1.11 Identification

1.11.1 Identification marks on the shank are to be approximately level with the fluke tips. On the fluke, these markings are to be approximately at a distance of two thirds from the tip of the bill to the centre line of the crown on the right hand fluke, looking from the crown towards the shank.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

1.11.2 The following details are to be shown on all anchors:
(a) LR or Lloyd's Register and abbreviated name of LR's local office issuing the certificate.
(b) Number of the certificate.
(c) Month and year of test.
(d) Mass (also the letters 'HHP' when approved as high holding power anchors or 'SHHP' when approved as super high holding power anchors).
(e) Mass of stock (in the case of stocked anchors).
(f) National Authority requirements, as applicable.
(g) Manufacturer's mark.

1.11.3 In addition to 1.11.2, each important part of an anchor is to be plainly marked by the maker with the words 'forged steel' or 'cast steel' as appropriate. Fabricated steel anchor heads do not require special marking.

1.12 Certification

1.12.1 The manufacturer is to provide the Surveyor with a written statement that the anchor has been manufactured and tested in accordance with LR Rules together with the following particulars:
(a) Purchaser's name and order number.
(b) Type of anchor and principal dimensions.
(c) Mass of anchor.
(d) Identification mark which will enable the full history of manufacture to be traced.
(e) Chemical composition.
(f) Details of heat treatment.
(g) Mechanical test results.
(h) Proof load.
(j) Results of the non-destructive examination.
(k) Weld location maps (cast steel anchors only).

1.12.2 Shanks, heads, pins, shackles and swivels are to be certified by LR in accordance with the relevant sections of Chapters 3, 4 and 5.

1.12.3 An LR Anchor Certificate is to be issued for the completed anchor which will include the following particulars:
(a) Manufacturer's name.
(b) Type of anchor.
(c) Mass of anchor.
(d) Grade of materials.
(e) Proof test load.
(f) Heat treatment.
(g) Marking applied to anchor.
(h) Dimensions.
(j) General Approval of an Anchor Design Certificate Number.
(k) Fluke and shank identification numbers.

Section 2
Stud link chain cables for ships

2.1 Scope

2.1.1 Provision is made in this Section for a range of grades, U1, U2 and U3, of stud link chain and fittings intended for anchor or mooring cables for ships.

2.1.2 The requirements for offshore mooring chain cables are given in Section 3.

2.2 Manufacture

2.2.1 All grades of chain cable and accessories are to be manufactured by approved procedures at works approved by LR. A list of approved manufacturers of stud link chain cables and fittings is published separately by LR.

2.2.2 The links may be made by the flash-butt or other approved welding process, or in the case of Grades U2 and U3 they may be flash-butt welded or drop forged, designated U2(a) or U3(a), or cast steel designated U2(b) or U3(b), *see* Table 10.2.5.

2.2.3 As far as practicable, consecutive links in all chain cable should originate from a single cast or batch of bar stock (*see* Ch 3,9.6.1), and indicating marks should be stamped on the final link formed from one cast or batch and the first link formed from a separate cast or batch.

2.2.4 A length of chain cable is to measure not more than 27,5 m and is to comprise an odd number of links. In this context, a length is a statutory term and is the basis for the number of test samples.

2.3 Flash butt welded chain cable

2.3.1 Bar material is to comply with the requirements of Ch 3,9 and may be heated either by electrical resistance or in a furnace. For electrical resistance heating, the process is to be controlled by an optical heat sensor. For furnace heating, thermocouples in close proximity to the bars are to be used for control. The temperature is to be continuously recorded. In both cases, the controls are to be checked at least once every eight hours and checks are to be recorded.

2.3.2 Mechanical properties testing of U1 cable is not required. For Grade U2 cable supplied in the as-welded condition, and Grade U3 in all conditions, one tensile and one set of three Charpy V-notch impact test specimens are to be taken at the side of a link opposite the weld from at least every fourth 27,5 m length of cable. A further set of three impact test specimens is to be taken with the notch positioned at the centre of the weld, *see* Table 10.2.3. The test specimens are not to be selected from the same length as that from which the breaking test sample is taken, unless breaking test samples are to be taken from every length of the batch. All test samples are to be correctly identified with the lengths of cable represented.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2.3.3 The test links from which the mechanical test specimens are prepared are to be made as part of the chain cable and are to be heat treated with it. They may be removed from the cable prior to heat treatment provided that each sample is heat treated with, and in the same manner as, the chain it represents and is subjected to the proof load appropriate to the chain grade and diameter prior to preparation of the mechanical test specimens.

2.3.4 The results of tests on specimens taken from the non-welded areas are to comply with the appropriate requirements of Table 10.2.1. The results of tests on the welds are to comply with the requirements of Table 10.2.6.

2.4 Cast chain cables

2.4.1 The manufacture of cast steel chain cable is generally to be in accordance with the requirements of Ch 4,1, as appropriate.

2.4.2 The chemical composition of ladle samples is to comply with the specification approved by LR.

2.4.3 Separately cast test samples are to be provided from each cast. They are to be of similar dimensions to the links they represent and are to be heat treated together with, and in the same manner as, the completed chain cable, *see* Table 10.2.3.

2.4.4 Tensile and Charpy V-notch impact test specimens are to be taken from each test sample and machined to the dimensions given in Ch 2,3.

2.4.5 The results of all tests are to comply with the requirements given in Table 10.2.1 for the relevant grade.

2.5 Forged chain cables

2.5.1 The procedure for the manufacture and testing of drop forgings for chain cable will be specially considered, but is generally to be in accordance with the appropriate requirements of Ch 5,1.

2.5.2 The chemical composition is to comply with Table 10.2.2.

2.5.3 The completed forgings are to be heat treated in accordance with Table 10.2.3.

2.5.4 Test samples in the form of forgings of similar dimensions to the links they represent and from the same cast and heat treatment charge are to be provided.

2.5.5 One tensile and three Charpy V-notch specimens are to be taken from each test sample.

2.5.6 The results of mechanical tests are to comply with the requirements of Table 10.2.1 for the relevant grade.

2.6 Stud material

2.6.1 Steel studs are to be used for all grades of welded chain cable. In general, the carbon content should not exceed 0,23 per cent but mechanical tests for acceptance purposes are not required.

2.7 Welding of studs

2.7.1 Where studs are welded into the links this is to be completed before the chain cable is heat treated.

2.7.2 The stud ends must be a good fit inside the link, and the weld is to be confined to the stud end opposite the flash-butt weld. The full periphery of the stud end is to be welded. If, however, it can be demonstrated to the Surveyor that the quality of welding is of a high standard then partial peripheral welding may be accepted provided that welds are made only at the sides of the stud and that each run extends continuously for at least 25 per cent of the stud periphery. Weld start/stop positions are not to be located in the plane of the chain cable.

2.7.3 The welds are to be made by qualified welders using an approved procedure and consumables approved to Grade 3 and low hydrogen, in accordance with Chapter 11.

2.7.4 The welds are to be of good quality and free from defects liable to impair the proper use of the chain. Undercuts, end craters and similar stress raising defects shall, where necessary, be ground off.

2.7.5 At least one stud weld within each length of cable is to be inspected using dye penetrant testing in accordance with Ch 1,5 after the chain has been proof loaded. If a crack is found, the stud welds in the adjoining links are to be inspected; if a crack is found in either link, all the stud welds in that length are to be inspected using dye penetrant.

2.7.6 The size of the stud welds is to be in accordance with Fig. 10.3.1.

2.8 Heat treatment of completed chain cables

2.8.1 The completed chain cable is to be heat treated in accordance with Table 10.2.3 for the appropriate grade of cable.

2.8.2 Special consideration will be given to the heat treatment of certain types of drop forged chain cable.

2.8.3 In all cases, heat treatment is to be carried out prior to the proof loading and breaking tests.

2.8.4 All test samples are to be heat treated with, and in the same way as, the chain cables they represent.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 10.2.1 Mechanical properties of finished chain cable and fittings

Grade	Yield stress N/mm² minimum	Tensile strength N/mm²	Elongation on $5{,}65\sqrt{S_o}$ % minimum	Reduction of area % minimum	Charpy V-notch impact tests	
					Test temperature °C	Average energy J minimum
U2	295	490 – 690	22	—	0 (*see* Note 1)	27
U3	410	690 minimum	17	40	0 –20 (*see* Note 2)	60 35

NOTES
1. When required *see* Table 10.2.3.
2. Testing may be carried out at either 0°C or –20°C.
3. Mechanical testing is not required for finished chain cables and fittings in Grade U1.

Table 10.2.2 Chemical composition of butt welded and forged chain cable

Grade	Chemical composition %												
	C max.	Si	Mn	P max.	S max.	Al	N max.	Cr max.	Cu max.	Nb max.	Ni max.	V max.	Mo max.
U1	0,20	0,15 – 0,35	0,40 min.	0,04	0,04	—	—	—	—	—	—	—	—
U2	0,24	0,15 – 0,55	1,60 max.	0,035	0,035	0,02 min. *see* Note 1	—	—	—	—	—	—	—
U3	0,33	0,15 – 0,35	1,90 max.	0,04	0,04	0,065 max. *see* Note 2	0,015	0,25	0,35	0,05 *see* Note 2	0,40	0,10 *see* Note 2	0,08

NOTES
1. Aluminium may be partly replaced by other grain refining elements.
2. To obtain fine grain steel, at least one of these grain refining elements must be present in sufficient amount.

Table 10.2.3 Condition of supply and scope of mechanical tests for finished chain cables and fittings

Grade	Manufacturing method	Condition of supply	Number of test specimens on every four lengths of chain cable of 27,5 m or less, or on each batch of fittings		
			Tensile test on base materials	Charpy V-notch impact test	
				Base material	Weldment

2.9 Testing of completed chain cables

2.9.1 All chain cables are to be subjected to a Proof Load test and a Breaking Load test. In addition, mechanical tests should be carried out where required, *see* Table 10.2.3.

2.9.2 All chain cables are to be tested in the presence of a Surveyor, at a proving establishment recognised by LR. A list of recognised proving establishments is published separately by LR. In addition to the requirements stated in this Chapter, attention must be given to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered.

2.10 Proof load tests

2.10.1 Each length of chain cable is to be subjected to a proof loading test in an approved testing machine and is to withstand the load given in Table 10.2.4 for the appropriate grade and size of cable.

2.10.2 On completion of the test, each link is to be visually examined and is to be free from significant defects. Special attention is to be given to welds.

2.10.3 Should any link be found to be defective it is to be replaced by an approved connecting link (joining shackle or substitute link as detailed in 2.14). The chain is then to be subjected to a repeat of the proof load test followed by re-examination.

2.10.4 If a link breaks during proof load testing, a sample consisting of three common links is to be taken from each side of the broken link and subjected to a breaking test as detailed in 2.10. If either of these samples fails, the length of cable is not to be accepted. A thorough examination of all broken links is to be made to determine the cause of failure and, after evaluation, LR will consider the extent of cable which is to be rejected.

2.11 Breaking load tests

2.11.1 Breaking load tests are to be carried out on three-link samples selected by the Surveyor from the completed (including heat treatment) chain. The test links may be removed from the chain prior to heat treatment provided that each sample is heat treated with, and in the same manner as the chain it represents. They are to be properly identified with the lengths of chain they represent.

2.11.2 The number of tests required is to be in accordance with Table 10.2.5 except that for chafing chain for Emergency Towing Arrangements (ETA), *see* Pt 3, Ch 13,10.2, one test is to be carried out on each 110 m of finished chains.

2.11.3 Breaking test specimens are to withstand the load given in Table 10.2.4 for the appropriate grade and size of cable. The specimen is considered to have passed this test if it has shown no sign of fracture after application of the required load for a minimum of 30 seconds.

2.11.4 Where a breaking test specimen fails, a further specimen is to be cut from the same length of cable and subjected to test. If this re-test fails, the length of cable from which it was taken is to be rejected. When this test is also representative of other lengths, each of the remaining lengths is to be individually tested by taking a breaking test specimen from each length of the batch. If one of these further tests fails, the entire set of lengths represented by the original test is to be rejected.

2.11.5 For large diameter cables where the required breaking load is greater than the capacity of the testing machines, special consideration will be given to acceptance of an alternative testing procedure.

2.12 Dimensional inspection

2.12.1 After proof testing, the entire chain is to be checked for length, five links at a time with an overlap of two links, which is to include the first five links, to ensure that the chain meets the tolerances given in 2.15.5. The measurements are to be made while the chain is loaded to about 10 per cent of the proof load.

2.12.2 The links held in the end blocks may be excluded from these measurements.

2.12.3 If a five link length of chain exceeds the tolerance given in 2.15.5, then the oversize links are to be removed and an approved connecting link inserted.

2.12.4 Checks of all other dimensions are to be made on three links, selected by the Surveyor, from every four 27,5 m lengths.

2.12.5 If one of the links detailed in 2.12.4 fails to comply with the required tolerances, measurements are to be made on a further five links in every four 27,5 m lengths.

2.12.6 If more than one link in a 27,5 m length of chain cable fails to meet the tolerance requirements, all the links in that length are to be measured.

2.12.7 All links failing to comply with the maximum dimensional tolerances are to be removed and replaced by connecting links of an approved type. The chain is then to be subjected to a further proof load test and re-examined.

2.12.8 If the length over five links is less than the nominal, then the chain may be stretched by loading above the specified proof test load provided that the applied load is not greater than ten per cent above the proof test load, and only random lengths of the chain need to be stretched.

2.12.9 Loads used for plastic straining to set studs are not to exceed 0,8 per cent of the proof load unless specifically approved for higher loads.

2.12.10 Paint or anti-corrosive coatings are not to be applied until these inspections are completed to the satisfaction of the Surveyor.

Table 10.2.5 Number of breaking tests from completed cables

Designation	Method of manufacture	Number of breaking test specimens
Grade U1	Flash-butt welded and heat treated	One from every four lengths of 27,5 m or less
Grade U2(a) U3(a)	Flash-butt welded, or drop forged and heat treated	One from every four lengths of 27,5 m or less
Grade U1 U2(a)	Flash-butt welded but not heat treated	One from each length of 27,5 m or less
Grade U2(b) U3(b)	Cast and heat treated	One per heat treatment batch with a minimum of one from every four lengths of 27,5 m or less

Table 10.2.6 Mechanical properties of welds in chain cables

Grade	Charpy V-notch impact test	
	Test temperature °C	Average energy J min
U1	—	—
U2	0 (*see* Note 1)	27
U3	0	50
	–20 (*see* Note 2)	27

NOTES
1. Impact tests are only required if the chain cable is not heat treated.
2. Impact testing may be carried out at 0°C or minus 20°C.

2.13 Fittings for chain cables

2.13.1 Cable fittings are to be manufactured at an approved works.

2.13.2 The materials from which the fittings are made are to be manufactured at approved works, in accordance with the appropriate requirements of Ch 4,1 or Ch 5,1 respectively. Alternative arrangements may be agreed provided that full details concerning the manufacturer are submitted to LR.

2.13.3 All fittings are to be manufactured to an approved manufacturing specification, and provision is to be made for tensile specimens and, where applicable, impact test specimens, *see* Table 10.2.3. The test samples are to be prepared in accordance with 2.4.3 or 2.5.4 as applicable. The test specimens are to be subjected to heat treatment with the fittings they represent. The mechanical test requirements are the same as those for the relevant grade of chain cable, *see* Table 10.2.1. A batch of fittings is to be of the same grade, size and heat treatment charge and to have originated from a single cast of steel. Enlarged and end links need not be tested provided that they are manufactured and heat treated together with the chain cable. Mechanical tests of pins are to be taken in accordance with 3.8.15.

2.13.4 Fittings such as shackles, swivels and swivel shackles are to be forged or cast in steel of at least Grade U2. The welded construction of fittings may also be approved providing that full details of the manufacturing process and the heat treatment are submitted.

2.13.5 All chain cable accessories, including spares, are to be subjected to the proof loads appropriate to the grade and size of cable for which they are intended. These include shackles, swivels, swivel shackles, enlarged links and end links. Anchor shackles, however, are to be tested in combination with the anchor, *see* 1.4.

2.13.6 The appropriate breaking load is to be applied for a minimum of 30 seconds to at least one item out of every batch of up to 25 (1 in 50 for lugless (Kenter) shackles), and this item is to be destroyed and not used as part of an outfit. For the purpose of break load testing, a batch of accessories is to be of the same grade, size and heat treatment charge and may consist of items from different casts, provided that the sample tested is from the cast with the lowest tensile properties. Enlarged and end links need not be tested provided that they are manufactured and heat treated together with the chain cable.

2.13.7 If the sample fails to withstand the breaking load without fracture, two more samples from the same batch may be tested. If either of these samples fails, the batch is to be rejected.

2.13.8 Where the items are of increased dimensions, and have been specially approved, or if material of a higher grade than is specified is used, then the breaking load is to be applied to each item, and the items so tested included with the outfit. For the purpose of this paragraph, items of increased dimensions are those so designed that their breaking strength is not less than 1,4 times the Rule minimum breaking load of the chain cable with which they are to be used.

2.13.9 LR may waive the breaking load test provided that:
(a) the breaking load test has been completed satisfactorily during approval testing, and
(b) the tensile and impact properties of each manufacturing batch are proved and
(c) the accessories are subjected to suitable non-destructive testing.

2.13.10 All testing is to be carried out in the presence of the Surveyor and to his satisfaction.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

2.13.11 All fittings are to be stamped in accordance with 2.16.

2.14 Substitute single links

2.14.1 Single links to connect lengths of chain cable or to substitute for defective links, without the necessity for re-heat treatment of the whole cable length, are to be made by the chain manufacturer in accordance with an approved procedure. Separate approvals are required for each grade of chain cable and the tests are to be made on the maximum size of chain for which approval is sought. Re-approval is required annually.

2.14.2 Manufacture and heat treatment of the substitute link are not to affect the strength of the adjoining links. The temperature reached by these links is nowhere to exceed 250°C.

2.14.3 The steel bar used is to conform with the specification for the chain in accordance with Ch 3,9.

2.14.4 Details of the method of manufacture, including heat treatment, are to be submitted for approval, together with the results of a series of tests laid down by LR.

2.14.5 All links involved in the approval tests are to be destroyed and are not to be used as part of a chain cable.

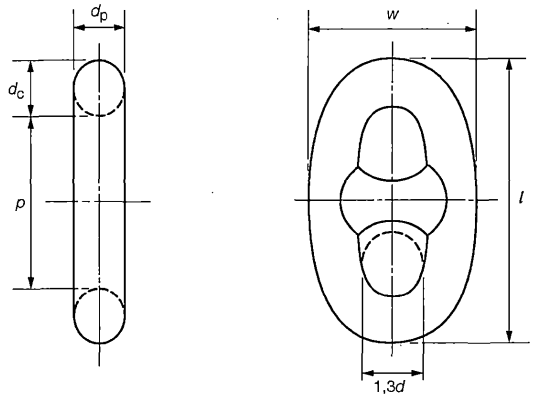
2.14.6 Every substitute link included in a chain cable is to be subjected to the proof load appropriate to the grade and size of chain in which it is incorporated, as detailed in Table 10.2.4.

2.14.7 Each substitute link is to be stamped on the stud with the identification marks listed in 2.16.1 plus a unique number for the link. The adjoining links are also to be stamped on the studs.

2.15 Dimensions and tolerances

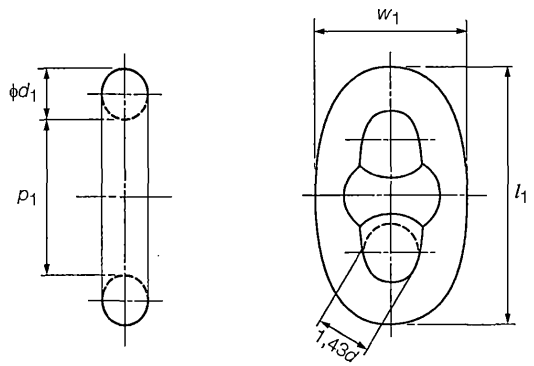
2.15.1 The form and proportion of links and shackles are to be in accordance with ISO/1704-2008, *see* Figs. 10.2.1 to 10.2.8. Design of chain cables must be to a standard recognised by LR, such as ISO 1704; alternatively the design may be specifically approved by LR.

2.15.2 Manufacturing tolerances on stud link chain are to be within ±2,5 per cent (taking into account that all components of the chain are to be a good fit with one another), except for those detailed in 2.15.3.



d_c = nominal diameter at crown measured in plane of link
d_p = nominal diameter at crown measured perpendicular to plane of link
l = 6d
p = 4d
w = 3,6d to the nearest millimetre

Fig. 10.2.1 Common link



d = nominal diameter of common stud link
d_1 = nominal diameter of enlarged stud link = 1,1d
l_1 = 6d_1 ≈ 6,6d
p_1 = 4d_1 ≈ 4,4d
w_1 = 3,6d_1 ≈ 3,96d

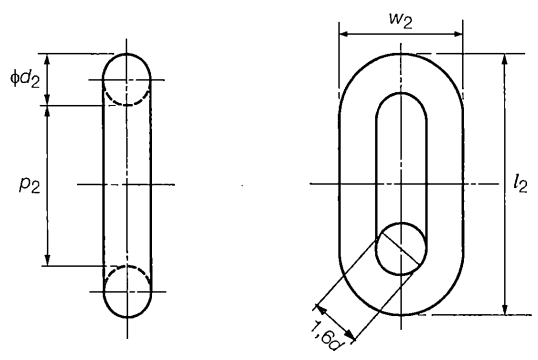
Fig. 10.2.2 Enlarged link

2.15.3 The nominal diameter, d, is to be the average of the diameters, measured in the plane of the link, d_c, and perpendicular to the plane of the link, d_p, *see* Fig. 10.2.1. The negative tolerance on the nominal diameter is not to exceed the following:

Minus 1 mm when $d \leq 40$ mm
Minus 2 mm when 40 mm $< d \leq 84$ mm
Minus 3 mm when 84 mm $< d \leq 122$ mm
Minus 4 mm when $d > 122$ mm

The plus tolerance on the diameter at the crown measured out of the plane of the link, d_p, is not to exceed 5 per cent.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.



d = nominal diameter of common stud link
d_2 = nominal diameter of end link = 1,2d (d_2 – 1,2d)
l_2 = $p_2 + 2d_2 \approx 6{,}75d$
p_2 = $3{,}65d_2 \approx 4{,}35d$
w_2 = $3{,}3d_2 \approx 4d$

Fig. 10.2.3 End link

2.15.4 The cross-sectional area is to be calculated using the nominal diameter, d. The cross-sectional area at the crown of the link is to have no negative tolerance.

2.15.5 The diameter measured at locations other than the crown is to have no negative tolerance. The plus tolerance is to be in accordance with Table 3.9.3 of Chapter 3 except at the butt weld where it is to be in accordance with the manufacturer's specification, which is to be agreed by LR.

2.15.6 The maximum allowable tolerance on a length of five links measured in accordance with 2.12.1 is plus 2,5 per cent. No under-tolerance is permitted.

2.15.7 All measurements are to be made on links selected by the Surveyor and are to be carried out to the Surveyor's satisfaction.

2.15.8 Studs are to be located in the links centrally, and at right angles to the sides of the link, although the studs of the final link at each end of any length may also be located off-centre to facilitate the insertion of the joining shackle. Tolerances in accordance with Fig. 10.3.1 are acceptable provided that the stud fits snugly and its ends lie flush against the inside of the link.

2.15.9 The following tolerances are applicable to accessories:

Nominal diameter: plus 5 per cent, minus 0 per cent
Other dimensions: ±2,5 per cent.

2.15.10 For lugless shackles of the Kenter type, the radii indicated in Fig. 10.2.8 are to be not less than 0,03 times the chain diameter.

2.15.11 All materials are to be free from internal and surface defects that might impair proper workability, use and strength. Subject to agreement by the Surveyor, surface defects may be removed by grinding provided the acceptable tolerances are not exceeded.

2.16 Identification

2.16.1 All lengths of Grades U1, U2 and U3 cable and all fittings are to be stamped with the following identification marks:

(a) LR or Lloyd's Register and abbreviated name of LR's local office issuing the certificate.
(b) Number of certificate.
(c) Proof load and grade of chain.
(d) Surveyor's personal stamp.
(e) Each length of chain cable is to be stamped on both ends.

2.17 Certification

2.17.1 An LR certificate is to be issued for chain cable only, fittings only or chain cable with associated fittings.

2.17.2 Each test certificate is to include the following particulars for all items included on the certificate:

(a) Purchaser's name and order number.
(b) Description and dimensions.
(c) Grade of chain cable.
(d) Identification mark which will enable the full history of the chain or fitting to be traced.
(e) Chemical composition.
(f) Details of heat treatment.
(g) Mechanical test results.
(h) Breaking test load.
(j) Proof load.

2.17.3 Where appropriate, the certificate is to include a list of all substitute links together with their grade of steel, the name of the steelmaker, the heat number and the purchase order number.

■ *Section 3*
Stud link mooring chain cables

3.1 Scope

3.1.1 Provision is made in this Section for five grades, R3, R3S, R4, R4S and R5, of stud link chain intended for offshore mooring applications such as mooring of mobile offshore units, offshore loading systems and gravity based structures during fabrication.

3.1.2 In addition, chain cable conforming to the requirements of the current edition of API specification 2F is acceptable provided that it has been manufactured, inspected and tested under Survey by LR, and that the bar stock has also been certified by LR in accordance with Ch 3,9.

3.2 Manufacture

3.2.1 All grades of chain cable and accessories are to be manufactured by approved procedures at works approved by LR. A list of approved manufacturers for stud link chain cables is published separately by LR.

3.2.2 The works in which the chain is manufactured is to have a quality system approved by LR. The provision of such a quality system is required in addition to and not in lieu of the witnessing of tests by a Surveyor.

3.2.3 Approval is confined to a single works and is limited to one grade of cable made from bar from a nominated and approved supplier. Separate approvals are required if steel bar is supplied from more than one works and for other grades of cable, *see also* Ch 3,9.

3.2.4 Details of the method of manufacture and the specification of the steel, are to be submitted.

3.2.5 Offshore mooring chains are to be made in continuous lengths by flash-butt welding.

3.2.6 Bar material may be heated either by electric resistance or in a furnace. For electrical resistance heating, the process is to be controlled by an optical heat sensor. For furnace heating, thermocouples in close proximity to the bars are to be used for control and the temperature is to be continuously recorded. In both cases, the controls are to be checked at least once every eight hours and records taken.

3.2.7 The following welding parameters (as approved in the weld procedure) are to be controlled during welding of each link:

(a) platen motion;
(b) current as a function of time; and
(c) hydraulic pressure.

The controls are to be checked at least once every four hours.

3.2.8 The records of bar heating, flash-butt welding and heat treatment are to be made available to the Surveyor when required.

3.2.9 As far as practicable, consecutive links in all chain cable should originate from a single batch of bar stock (*see* Ch 3,9.6.1) and indicating marks should be stamped on the final link formed from one batch and the first link formed from a separate batch.

3.3 Dimensions and tolerances

3.3.1 The form and proportions of links and shackles are to be in accordance with ISO/1704-2008, *see* Figs. 10.2.1 to 10.2.8. Design of chain cables must be to a recognised standard, such as ISO 1704; alternatively the design may be specifically approved by LR. Link tolerances are to be in accordance with 3.3.2 to 3.3.6.

3.3.2 Diameter measured at the crown:

Minus 1 mm when $d_c \leq 40$ mm
Minus 2 mm when 40 mm $< d_c \leq 84$ mm
Minus 3 mm when 84 mm $< d_c \leq 122$ mm
Minus 4 mm when 122 mm $< d_c \leq 152$ mm
Minus 6 mm when 152 mm $< d_c \leq 184$ mm
Minus 7,5 mm when 184 mm $< d_c \leq 210$ mm

The plus tolerance must not exceed 5 per cent of the nominal diameter, and the cross-sectional area at the crown is to have no negative tolerance.

3.3.3 The diameter measured at locations other than the crown is to have no negative tolerance. The plus tolerance is to be in accordance with Table 3.9.3 except at the butt weld where it is to be in accordance with the manufacturer's specification, which is to be agreed by LR.

3.3.4 The maximum allowable tolerance on a length of five links measured in accordance with 2.12.1 is +2,5 per cent. No under-tolerance is permitted.

3.3.5 A manufacturing tolerance on all other dimensions of ±2,5 per cent is acceptable subject to all parts fitting properly together.

3.3.6 The tolerances for common links are to be measured in accordance with Fig. 10.3.3.

3.3.7 All measurements are to be made on links selected by the Surveyor and are to be carried out to the Surveyor's satisfaction.

3.3.8 Studs are to be located in the links centrally, and at right angles to the sides of the link, although the studs of the final link at each end of any length may also be located off-centre to facilitate the insertion of the joining shackle. The tolerances in accordance with Fig. 10.3.2 are acceptable provided that the stud fits snugly and its ends lie flush against the inside of the link.

3.4 Studs

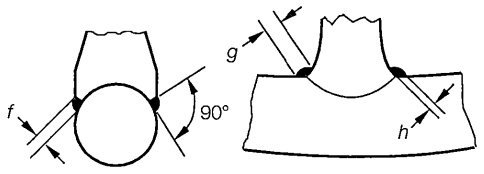
3.4.1 The studs are to be made of steel corresponding to that of the chain or in compliance with a specification approved by LR. In general, the carbon content should not exceed 0,23 per cent if the studs are to be welded in place.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

3.4.2 Studs may be welded into grade R3 and R3S chains. The welding of studs into grade R4, R4S and R5 chain is not permitted unless specially approved.

3.4.3 In all cases where studs are welded into links, this is to be carried out in accordance with 2.7.

3.4.4 The size of the stud welds is to be in accordance with Fig. 10.3.1.



Dimension Designation	Nominal Dimension	Minus Tolerance
f	0,10*d*	0,01*d*
g	0,20*d*	0,02*d*
h	0,09*d*	0,01*d*

d = Nominal diameter of barstock

3450/02

Fig. 10.3.1
Dimensions and tolerances of stud welds

3.4.5 All stud welds are to be visually inspected. At least 10 per cent of all stud welds within each length of chain are to be examined by magnetic particle inspection after proof load testing. Stress raising defects such as cracks, lack of fusion, gross porosity, and undercuts exceeding 1 mm are not permitted; if any such defects are found, then all stud welds in that length of chain are to be examined by means of magnetic particle inspection.

3.4.6 Where plastic straining is used to set studs, the applied load is not to be greater than that qualified in approval tests. The combined effect of shape and depth of the impression of the stud in the link is not to cause any harmful notch effect or stress concentration.

3.5 Heat treatment of completed chain cables

3.5.1 The chain is to be normalised, normalised and tempered or quenched and tempered in accordance with the specification approved by LR.

3.5.2 The chains are to be heat treated in a continuous furnace; batch heat treatment is not permitted.

3.5.3 The temperature and time, or temperature and chain speed, are to be controlled and continuously recorded.

3.5.4 Heat treatment is to be carried out prior to the proof loading and breaking tests.

3.5.5 Calibration of furnaces is to be verified by measurement and recording of actual link temperature (surface and internal).

3.6 Testing of completed chain cables

3.6.1 All chain cables are to be tested in the presence of a Surveyor, at a proving establishment recognised by LR. A list of recognised proving establishments is published by LR. In addition to the requirements stated in this Chapter, attention must be given to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered.

3.6.2 The entire length of chain cable is to be subjected to a proof loading test in an approved testing machine and is to withstand the load given in Table 10.3.1 for the appropriate grade and size of cable.

3.6.3 Care should be taken to obtain a uniform stress distribution in the links being tested.

3.6.4 The chain is to be shot or sand blasted prior to testing in order to ensure that its surfaces are free from scale, paint or other coating for inspection.

3.6.5 On completion of the proof load test, each link is to be visually examined and is to be free from significant defects such as mill defects, surface cracks, dents and cuts, especially where gripped by clamping dies during flash butt welding. Studs are to be securely fastened and any burrs, irregularities and rough edges are to be removed by careful grinding.

3.6.6 All flash butt welds, including the area gripped by the clamping dies, are to be examined by magnetic particle inspection. The area is to be free from cracks, lack of fusion, gross porosity and any other stress concentrations.

3.6.7 Surface defects in the region of the flash butt welds may be removed by grinding, provided that the depth of grinding does not exceed five per cent of the link diameter and is smoothly contoured into the surrounding material. The final dimensions are still to conform with the agreed standard.

3.6.8 All flash butt welds are also to be examined by ultrasonic inspection and are to be free from defects such as internal cracks or lack of fusion.

3.6.9 All non-destructive examination is to be carried out in accordance with approved procedures, in accordance with Ch 1,5.

3.6.10 All non-destructive examination operators are to be qualified to a minimum Level II, qualified in accordance with a recognised standard.

3.6.11 After proof testing, the entire chain is to be checked for length, five links at a time with an overlap of two links, which is to include the first five links, to ensure that the chain meets the tolerances given in 2.15.5. The measurements are to be made while the chain is loaded to about 10 per cent of the proof load.

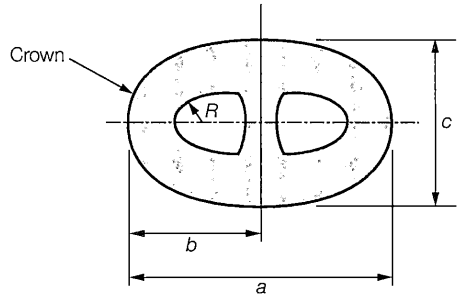
Fig. 10.3.2 Stud link tolerances

The internal link radii (*R*) and external radii should be uniform



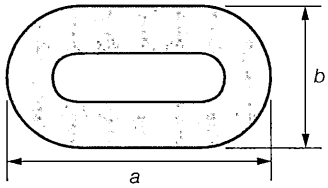
Designation	Description	Nominal dimension of the link	Minus tolerance	Plus tolerance
a	Link length	6*d*	0,15*d*	0,15*d*
b	Link half length	*a**/2	0,10*d*	0,10*d*
c	Link width	3,6*d*	0,09*d*	0,09*d*
e	Stud angular misalignment	0 degrees	4 degrees	4 degrees
R	Inner radius	0,65*d*	0	—

Symbols

d = nominal diameter of chain
*a** = actual link length

Fig. 10.3.3 Studless and common link tolerances

The internal link radii (*R*) and external radii should be uniform



Designation	Description	Nominal dimension of the link	Minus tolerance	Plus tolerance
a	Link length	6*d*	0,15*d*	0,15*d*
b	Link width	3,35*d*	0,09*d*	0,09*d*
R	Inner radius	0,60*d*	0	—

Symbols

d = nominal diameter of chain

NOTE
Other dimensional ratios are subject to special approval.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

3.6.12 The links held in the end blocks may be excluded from these measurements.

3.6.13 If the length over five links is less than the nominal, the chain may be stretched by loading above the specified proof test load provided that the applied load is not greater than ten per cent above the proof test load, and that only random lengths of the chain need to be stretched.

3.6.14 Loads used for plastic straining to set studs are not to exceed those approved in qualification tests.

3.6.15 Checks of all other dimensions are to be made on at least five per cent of the links in the cable.

3.6.16 If any link fails to meet the dimensional tolerance requirements (*see* 3.3), measurements are to be made on 20 more links on each side of the incorrect one. If failure to meet any particular dimensional requirements occurs in more than two of the measured links, then all the links are to be dimensionally checked.

3.6.17 Should any link be found to be defective or fail to meet the dimensional tolerance requirements or if a five link length of chain exceeds the specified tolerance, the unsatisfactory links are to be removed from the chain, and connecting common links complying with the requirements of 3.7 inserted in their places.

3.6.18 The chain is then to be subjected to a further proof load test and re-examined.

3.6.19 The number of connecting common links which may be used to replace defective links is not to exceed three in any 100 m length of chain. The number and type of joining shackles which may be used are to be subject to the written agreement of the end user.

3.6.20 If a link breaks during proof load testing, a sample consisting of three common links is to be taken from each side of the broken link and subjected to a breaking test as detailed in 3.6.21 and 3.6.22. If either of these samples fails, the proof loaded length of cable is not to be accepted. A thorough examination of all broken links is to be made to determine the cause of failure and, after evaluation, LR will consider the extent of cable which is to be rejected and also the possibility that similar factors to those which caused the failure may also be present in other parts of the cable, or other chain cables. The Surveyor is to be advised in advance of all examinations, with reasonable notice being given.

3.6.21 In addition to the requirements of 3.6.2, three link samples are to be selected by the Surveyors from the completed chain for breaking tests. The number of tests required is to be in accordance with Table 10.3.2. Extra links are to be provided for the mechanical tests detailed in 3.6.25. All test links are to be made as part of the chain cable and are to be heat treated with it. These may be removed from the cable prior to heat treatment provided that each sample is heat treated with, and in the same manner as, the chain it represents and is subjected to the proof load appropriate to the chain grade and diameter prior to selection of the mechanical test specimens. They are to be properly identified with the length of chain they represent.

Table 10.3.2 Frequency of break and mechanical tests

Nominal chain diameter mm	Maximum sampling interval m (*See* Note)
Min. — 48	91
49 — 60	110
61 — 73	131
74 — 85	152
86 — 98	175
99 — 111	198
112 — 124	222
125 — 137	250
138 — 149	274
150 — 162	297
163 — 175	322
176 — 186	346
187 — 199	370
199 — 210	395

NOTE
If the sampling interval contains links made from more than one cast, extra break and mechanical tests are required so that tests are made on every cast.

3.6.22 Breaking test specimens are to withstand the load given in Table 10.3.1 for the appropriate grade and size of cable for a period of 30 seconds. The specimen is considered to have passed this test if it has shown no sign of fracture after application of the required load.

3.6.23 If a breaking test specimen fails, two further specimens are to be cut from the same sampling length and both are to be subjected to the breaking test load. If one of the re-test specimens fails the length is to be rejected. All the broken links are to be subjected to an investigation into the cause of failure. LR will then decide which lengths of chain can be accepted and on further action.

3.6.24 For large diameter cables where the required breaking load is greater than the capacity of the testing machines, special consideration will be given to acceptance of an alternative testing procedure.

3.6.25 One tensile and three sets of Charpy V-notch impact test specimens are to be taken from links cut from the heat treated and proof loaded chain at intervals no greater than those indicated in Table 10.3.2 provided that every cast is sampled. The tensile specimen and one set of impact specimens are to be taken from the side of the link opposite the weld. One set of impact test specimens is to have the notches positioned at the centre of the flash butt weld and the third set is to be taken from the bend. All the specimens are to be taken from positions in accordance with Fig. 10.3.4.

3.6.26 The frequency of testing at the link bends may be reduced at the discretion of LR provided it can be verified that the required toughness is achieved consistently.

3.6.27 The results of the mechanical tests are to comply with the requirements of Table 10.3.3.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 10.3.3 Mechanical properties of chain cable materials

Grade	Yield stress N/mm² minimum	Tensile strength N/mm²	Elongation % minimum	Reduction of area % minimum (See Note 3)	Charpy V-notch impact tests		
					Test temperature °C	Average energy J minimum	Average energy flash weld J minimum
R3	410 (See Note 1)	690 minimum (See Note 1)	17	50	0 –20 (See Note 2)	60 40	50 30
R3S	490 (See Note 1)	770 minimum (See Note 1)	15	50	0 –20 (See Note 2)	65 45	53 33
R4	580 (See Note 1)	860 minimum (See Note 1)	12	50	–20	50	36
R4S (See Note 4)	700 (See Note 1)	960 (See Note 1)	12	50	–20	56	40
R5 (See Note 4)	760 (See Note 1)	1000 (See Note 1)	12	50	–20	58	42

NOTES
1. The ratio of yield strength to tensile strength should not exceed 0,92.
2. Testing may be carried out at either 0°C or –20°C.
3. For cast fittings, the minimum values for reduction of area are to be 40% for Grades R3 and R3S and 35% for Grades R4, R4S and R5.
4. The maximum hardness for Grade R4S is to be HB330, and for Grade R5 is to be HB340.

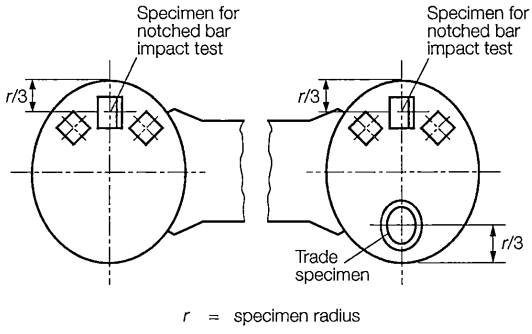

Fig. 10.3.4 Sampling of chain links

3.6.28 If the tensile test requirements are not achieved, two further specimens from the same sample are to be tested. The related length of chain will be considered acceptable if both re-test specimens meet the requirements but failure of either of the re-test specimens will result in rejection of the sampling length of chain represented by the tests.

3.6.29 If the impact test requirements are not achieved, re-tests may be carried out in accordance with Ch 1,2.4. Failure to meet the re-test requirements will result in rejection of the sampling length of chain represented by the tests.

3.6.30 The mass per unit length of stud link mooring cable is to comply with Table 10.3.4.

3.7 Connecting common links or substitute links

3.7.1 Single links to connect lengths of heat treated chain cable or to substitute for test links or defective links without the necessity for re-heat treatment of the whole length of cable are to be made by the chain manufacturer in accordance with an approved procedure. Separate approvals are required for each grade of chain cable and tests are to be made on the maximum size of chain for which approval is sought.

3.7.2 Manufacture and heat treatment of the connecting common link is not to affect the strength of the adjoining links. The temperature reached by these links is nowhere to exceed 250°C.

3.7.3 The steel bar used is to conform with the specification for the chain and approved by LR in accordance with Ch 3,9.

3.7.4 Details of the method of manufacture, including heat treatment, are to be submitted for approval, together with the results of a series of tests laid down by LR.

3.7.5 All links involved in the approval tests are to be destroyed and are not to be used as part of a chain cable.

3.7.6 Every connecting common link included in a chain cable is to be subjected to the proof load appropriate to the grade and size of chain in which it is incorporated as detailed in Table 10.3.1.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

205	1223
210	1283

3.7.7 Every connecting common link is to be inspected in accordance with 3.6.5 to 3.6.10.

3.7.8 A second identical link is to be made for mechanical tests which are to be in accordance with 3.6.25. This test link is also to be inspected in accordance with 3.7.7.

3.7.9 Each connecting common link is to be stamped on the stud with the identification marks listed in 3.9.1 plus a unique number for the link. The adjoining links are also to be stamped on the studs.

3.8 Fittings for offshore mooring chain

3.8.1 Cable fittings are to be manufactured at an approved works. Fittings include, but are not limited to, shackles, triplates, end shackles, swivels, and swivel shackles.

3.8.2 The materials from which the fittings are made are to be manufactured at approved works, in accordance with the appropriate requirements of Ch 4,1 or Ch 5,1, and 3.8.3 to 3.8.6. Alternative arrangements may be agreed provided that full details concerning the manufacturer are submitted to LR.

3.8.3 Steel used for fittings must be manufactured by an approved process, and be killed and fine grain treated.

3.8.4 The austenite grain size of steel used for fittings must be 6 or finer as measured in accordance with ASTM E112.

3.8.5 Steel used for forgings or castings for grades R4S and R5 must be vacuum degassed.

3.8.6 For steel used for forgings or castings for grades R4S and R5 the following tests are to be carried out on each heat:

(a) Assessment and quantification of the level of non-metallic micro inclusions. These must be acceptable for the final product.

(b) Macro etching on representative sample, in accordance with ASTM E381 or equivalent, this must be free from any injurious segregation or porosity.

(c) Jominy hardenability tests in accordance with ASTM A255 or equivalent.

The results of these tests are to be supplied by the steel manufacturer, and the results are to be included in the final accessory documentation.

3.8.7 Fittings for chain are to be heat treated in accordance with procedures that have been approved by LR.

3.8.8 All fittings are to be manufactured to a manufacturing specification approved by LR, and provision is to be made for tensile and impact test specimens. The test samples are to be subjected to heat treatment with the fittings they represent. The mechanical test requirements are the same as those for the relevant grade of chain cable, *see* Table 10.3.3.

3.8.9 A batch is defined as fittings from the same heat of steel that have been part of the same heat treatment charge.

3.8.10 Mechanical tests for fittings are to be taken from full size fittings that have been heat treated with the production batch they represent, and the tests are to be taken after the fitting has been proof load tested. It is not permitted to use separate representative coupons unless approved by LR in accordance with 3.8.14.

3.8.11 Forged shackle bodies and forged Kenter shackles are to have a set of three Charpy impact tests and a tensile test taken from the crown of the shackle. For smaller diameter shackles, where the geometry does not allow for the tensile test to be taken from the crown, this may be taken from the straight portion from the locations specified in Fig. 10.3.5, with the Charpy impact test specimens on the outside radius.

3.8.12 The test pieces for cast shackle bodies and cast Kenter shackles can be taken from the straight portion of the fitting from the locations shown in Fig. 10.3.5.

3.8.13 For fittings with complex geometries the locations of test pieces taken are to be approved by LR.

3.8.14 Where fittings are produced in small batches (less than 5) alternative testing may be approved; a proposal must be submitted in a written procedure for consideration.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

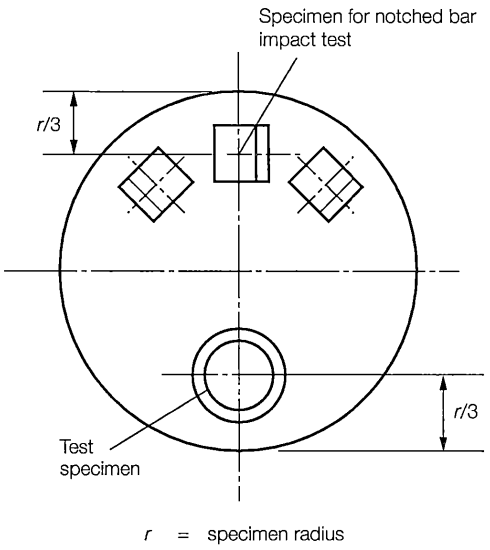

Fig. 10.3.5
Sampling of steel bars, forgings and castings

3.8.15 Mechanical tests of pins are to be taken as shown in Fig. 10.3.6 from the mid length of a sacrificial pin of the same diameter as the final pin. For oval pins, the diameter taken is to represent the smaller dimension. Mechanical tests may be taken from an extended pin of the same diameter as the final pin that incorporates a test prolongation and a heat treatment buffer prolongation, where equivalence with mid length test values have been established. The length of the buffer is to be at least equal to 1 pin diameter which is removed after the heat treatment cycle is finished. The test coupon can then be removed from the pin. The buffer and test are to come from the same end of the pin, as shown in Fig. 10.3.6.

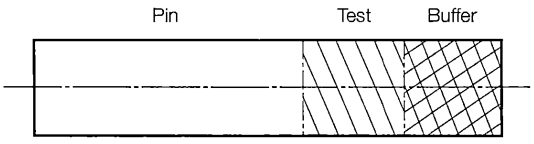

Fig. 10.3.6
Buffer and test piece location for pins

3.8.16 Manufacturers intending to supply accessories in the machined condition (e.g. Kenter type shackles) are to submit detailed drawings for approval by LR.

3.8.17 All chain cable accessories, including spares, are to be subjected to the proof loads appropriate to the grade and size of cable for which they are intended, *see* Table 10.3.1. Prior to this test, the accessories are to be shot or sand blasted to ensure that their surfaces are free from scale, paint or any other coating which could interfere with any subsequent inspection.

3.8.18 The appropriate breaking load as required by Table 10.3.1 is to be applied to at least one item out of every batch of up to 25, and this item is to be destroyed and not used as part of an outfit.

3.8.19 If the sample fails to withstand the breaking load without fracture, or in the event of failure of any other test, then the entire batch is to be rejected unless the cause of failure has been determined and it can be demonstrated that the condition causing failure is not present in any of the other accessories in the batch. If this can be demonstrated then two more samples from the same batch may be tested. If either of these samples fails, the batch is to be rejected.

3.8.20 For very large fittings where the required breaking load is greater than the capacity of the testing machine and for individually produced accessories or accessories produced in small batches, proposals for an alternative method of testing will be given special consideration. All proposals for alternative testing methods are to be detailed in writing and submitted.

3.8.21 At least one accessory from each batch is to be checked dimensionally after proof load testing. The manufacturer is to provide a statement that the dimensions comply with the specified requirements.

3.8.22 The following tolerances apply of the unmachined dimensions of all fittings;

(a) nominal diameter plus 5 per cent, minus 0 per cent; and
(b) other dimensions plus or minus 2,5 per cent.

3.8.23 All accessories are to be subjected to close visual examination after proof load testing, particular attention being paid to machined surfaces and highly stressed regions. All accessories are also to be examined by magnetic particle or dye penetrant inspection and ultrasonic testing. All NDE is to be carried out in accordance with 3.6.9 and 3.6.10. The manufacturer is to provide a statement that the non-destructive examination has been carried out with satisfactory results; this statement is to include reference to the techniques used and the operator's qualifications.

3.8.24 All testing is to be carried out to the satisfaction and in the presence of the Surveyor.

3.8.25 Fittings with increased dimensions, or fittings of a higher material grade, may be specially approved and included in an outfit, provided that;

(a) each item is successfully tested at the required breaking load for the chain cable for which they are intended; and
(b) items of increased dimensions are so designed that their breaking strength is not less than 1,4 times the Rule minimum breaking load for the chain cable for which they are intended, and this has been verified by procedure tests.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

3.9 Identification

3.9.1 Each length of chain is to be permanently marked with the following:

(a) LR and abbreviated name of LR's local office issuing the certificate.
(b) Certificate number (this may be abbreviated provided it is stated in the certificate).
(c) Grade and proof load of chain.

3.9.2 The chain is to be marked as follows:

(a) at each end (the marking should identify the leading and tail end of each chain),
(b) at intervals not exceeding 100m,
(c) on all connecting common links or shackles and the immediately adjacent links,
(d) on the first and last common link of each individual charge used in the continuous length.

3.9.3 All identification marks are to be made on the studs and are to be permanent and legible throughout the expected service life of the chain.

3.10 Documentation

3.10.1 A complete Chain Inspection and Testing Report, in booklet form, is to be provided by the chain manufacturer for each continuous chain length, and for each order for chain and fittings. It is to include all dimensional checks, test and inspection reports, non-destructive test reports, process records, as well as any non-conformity, together with corrective action and repair work.

3.10.2 All documents, including reports and appendices, are to contain a reference to the relevant certificate number.

3.10.3 The chain manufacturer is responsible for storing all the documentation in a safe and retrievable manner for a period of at least 10 years.

3.11 Certification

3.11.1 An LR certificate is to be issued for each continuous single length of chain, and each type of fitting, *see* Ch 1,3.1.

3.11.2 Each test certificate is to include the following particulars:

(a) Purchaser's name and order number.
(b) Description and dimensions.
(c) Grade of chain cable.
(d) Identification mark which will enable the full history of the chain to be traced.
(e) Chemical composition.
(f) Details of heat treatment.
(g) Mechanical test results.
(h) Breaking test load.
(j) Proof load.
(k) The number and locations of all connecting common links and all marked links.

Section 4
Studless mooring chain cables

4.1 Scope

4.1.1 Provision is made in this Section for five grades, R3, R3S, R4, R4S and R5 of studless flash butt welded chain cable intended for long term mooring applications.

4.1.2 The chain is generally expected to be deployed only once for a pre-determined service life.

4.1.3 Each studless chain link design will require to be approved by LR. The plan submitted for this approval is to include the minimum proof and breaking test loads, and the chain mass calculations.

4.2 Manufacture

4.2.1 All the requirements of 3.2, with the exception of that relating to studs, apply to the manufacture of studless mooring chain cables.

4.3 Shape and dimensions of links

4.3.1 The shape and dimensions of the links are to be in accordance with the approved design.

4.4 Dimensional tolerances

4.4.1 The dimensional tolerances of studless links are to be in accordance with the requirements of 3.3.1 to 3.3.7.

4.5 Heat treatment

4.5.1 Heat treatment of the chain is to be in accordance with the requirements of 3.5.

4.6 Testing of completed chain

4.6.1 All chain cables are to be tested in the presence of a Surveyor, at a proving establishment recognised by LR. A list of recognised proving establishments is published by LR. In addition to the requirements stated in this Chapter, attention must be given to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered.

4.6.2 The entire length of chain cable is to be subjected to a proof load test in an approved testing machine and is to withstand the load given in Table 10.3.1 for the appropriate grade and diameter of the chain, *see also* 4.1.3.

4.6.3 Inspection after proof load testing is to be in accordance with the requirements given in 3.6.3 to 3.6.20, excluding that related to checking of studs in 3.6.5.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

4.6.4 In addition to the inspection of the flash butt welded areas as required in 3.6.6, the surfaces of the bends of at least 10 per cent of the links are to be examined by magnetic particle inspection and are to be free from cracks or other defects.

4.6.5 If stretching of links is required in order to maintain dimensional tolerances, the load applied is not to exceed the proof load by more than 10 per cent, and only random lengths of the chain need to be stretched.

4.6.6 Breaking load tests are to be carried out in accordance with 3.6.21 to 3.6.23 and Tables 10.3.1 and 10.3.2.

4.6.7 Alternative procedures to breaking load testing (*see* 3.6.24) are not permissible unless prior agreement is given by LR after special consideration.

4.6.8 Mechanical testing is to be carried out in accordance with 3.6.25 to 3.6.30 and Table 3.3.3.

4.6.9 The weight of the chain cable is to be in accordance with the approved plan.

4.7 Connecting or substitute links

4.7.1 Connecting links and substitute links are to be in accordance with the requirements of 3.7.

4.8 Fittings

4.8.1 Fittings for studless chain are to comply with the requirements of 3.8.

4.9 Identification

4.9.1 All chain and each fitting is to be identified in accordance with 3.9.1 and 3.9.2.

4.9.2 Identification marks are to be made on the outside of the straight part of the link, opposite the flash butt weld.

4.10 Certification

4.10.1 Certificates are to be issued in accordance with 3.11.

4.11 Documentation

4.11.1 Documentation in accordance with 3.11 is to be provided by the manufacturer.

■ *Section 5* Short link chain cables

5.1 Scope

5.1.1 This Section gives the requirements for electrically welded steel short link chain cable for marine use but excluding those applications covered by the *Code for Lifting Appliances in a Marine Environment*.

5.1.2 Provision is made for grade M(4), as defined in ISO 1834:1999. Allowance is also made for the requirements of ISO 4565.

5.2 Manufacture

5.2.1 Short link chain cables are to be manufactured at works approved by LR. A list of approved manufacturers for short link chain cable is published separately by LR.

5.2.2 The chain is to be supplied in either the normalised or quenched and tempered condition. Heat treatment is to be carried out prior to proof and breaking load testing.

5.2.3 The chain may be galvanised using a hot dipping process provided that this is carried out prior to proof and breaking load testing. If galvanised, it is recommended that the thickness of the zinc coating be not less than 70 microns.

5.2.4 Unless otherwise agreed, the finished chain is to be free from coatings other than zinc.

5.3 Bar material

5.3.1 Bars for the manufacture of short link chain cable are to be made and tested in accordance with the appropriate requirements of Ch 3,1 and to the requirements of an International or acceptable National Standard.

5.3.2 The bars are to be made at a works approved by LR.

5.3.3 The steel is to be fully killed and fine grain treated.

5.3.4 The steel is to have mechanical properties which will allow the chain to meet the mechanical test requirements of 5.4.7 and Table 10.5.1.

5.4 Testing and inspection of chain cables

5.4.1 All chain cable of 12,5 mm diameter and above, and all steering chains irrespective of diameter, are to be tested in the presence of a Surveyor at a proving establishment recognised by LR. A list of recognised proving establishments is published by LR. In addition to the requirements stated in this Chapter, attention is to be given to any relevant statutory requirements of the National Authority of the country in which the ship or other marine structure is to be registered.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

Table 10.5.1 Mechanical test requirements for short link chain cables

Chain diameter mm	Grade M(4)	
	Proof load kN	Breaking load minimum kN
5	7,9	15,8
6,3	12,5	25
7,1	15,9	31,8
8	20,2	40,4
9	25,5	51
10	29,5	63
11,2	31,5	79
12,5	49,1	98,2
14	63	126
16	81	162
18	102	204
20	126	252
22,4	158	316
25	197	394
28	247	494
32	322	644
36	408	816
40	503	1006
45	637	1274

5.4.2 For chain of diameter less than 12,5 mm, other than steering chains, the manufacturer's tests will be acceptable.

5.4.3 After completion of all manufacturing processes, including heat treatment and galvanising, the whole of the chain is to be subjected to the appropriate proof load specified in Table 10.5.1.

5.4.4 The whole of the chain is to be inspected after the proof load test and is to be free from significant defects.

5.4.5 At least one sample, consisting of seven or more links, is to be selected by the Surveyor from each 200 m or less of chain for breaking load tests. Two additional links may be required for engagement in the jaws of the testing machine. These extra links are not to be taken into account in determining the total elongation, *see* 5.4.7.

5.4.6 The breaking load is to comply with the appropriate requirements of Table 10.5.1.

5.4.7 The total elongation of the breaking load sample at fracture, expressed as a percentage of the original inside length of the sample after proof loading, is to be not less than 20 per cent.

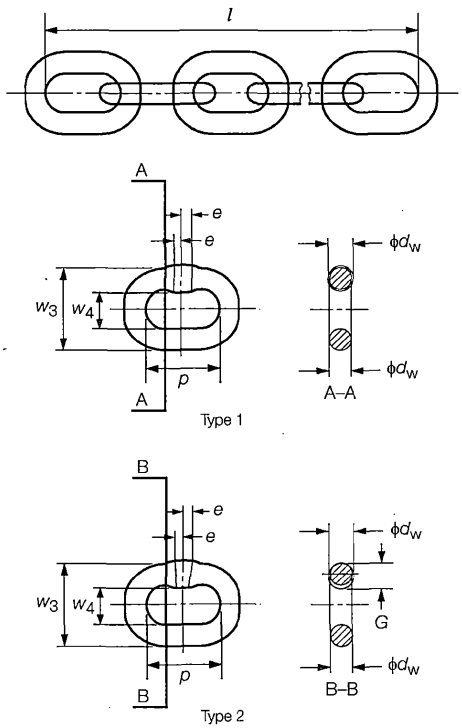
5.5 Dimensions and tolerances

5.5.1 The form and proportions of links are to be in accordance with Fig. 10.5.1.

5.5.2 Manufacturing tolerances are to be within the following limits:

Nominal diameter, d_n	± 5%
Pitch of chain, p_1	± 3%
Length measured over 11 links, l	± 2%
Inside width, w_1	$1{,}35d_n$ minimum
Outside width, w	$3{,}6d_n$ maximum

The tolerances are to apply after galvanising. All measurements are to be taken after proof testing.



l = multiple pitch length
p = pitch (internal link length)
d_n = measured diameter of the material, except at the weld
d_w = measured diameter of the material at the weld (Type 1) or weld dimension perpendicular to the plane of the link (Type 2)
G = dimension in other planes as per individual chain specification (Type 2)
e = length affected by welding, on either side of the centre link
w_1 = internal link width away from the weld
w_2 = external link width away from the weld
w_3 = external link width over the weld
w_4 = internal link width at the weld

Fig. 10.5.1 Form and proportions of links

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

5.6 Identification

5.6.1 All lengths of cable are to be stamped with the following identification marks:
(a) Inspector's mark and date.
(b) Reference mark or number of certificate.
(c) Manufacturer's mark or name.
(d) Chain cable quality mark, M, is to be stamped on at least each twentieth link or at intervals of one metre, whichever is the lesser distance.

5.6.2 Where the inspection is performed under LR's supervision, the inspector's mark and date are to be replaced by LR and the abbreviated name of LR's local office issuing the certificate.

5.7 Certification

5.7.1 The manufacturer is to supply the Surveyor with a certificate stating compliance with an appropriate ISO standard, and also, in the event of the requirements of 5.4 being undertaken other than in the presence of the Surveyor, stating that the test and inspection requirements have been complied with at a recognised proving establishment.

5.7.2 Each test certificate is to include the following particulars:
(a) the quality and description of chain,
(b) identification mark,
(c) nominal size of chain,
(d) proof load,
(e) breaking load,
(f) total elongation at fracture,
(g) where appropriate, the name of the proving establishment.

■ *Section 6* Steel wire ropes

6.1 Scope

6.1.1 Provision is made in this Section for the requirements for the manufacture, testing and certification of steel wire ropes intended to be used for general marine purposes, as well as permanent anchoring, mooring and marine lifting applications.

6.2 General requirements

6.2.1 For general marine purposes, such as stream wires, towlines and ship mooring lines, the construction is to be in accordance with Table 10.6.1. The construction, diameter and strength of steel wire ropes for permanent offshore applications, such as mooring, anchoring and lifting, are covered by other LR Rules. Alternative applications of wire ropes may be accepted, subject to special consideration.

6.2.2 The manufacturer's plant and method of production are to be approved by LR. A list of approved manufacturers of steel wire ropes is published annually in the *List of Approved Manufacturers of Materials*.

6.2.3 For shaped wire, for example, for large diameter ropes for permanent mooring, where there are no established Standards, the manufacturer is to provide evidence by way of test reports that specifications have been developed and agreed with the purchaser and LR for the purposes intended.

6.3 Steel wire for ropes

6.3.1 Steel wire is to be of homogeneous quality, uniform strength and free of defects likely to impair the manufacture and performance of the rope.

6.3.2 For all ropes, the specified minimum tensile strength of the wire is to be 1420, 1570, 1770 or 1960 N/mm^2. The specified minimum tensile strength of the wire is the designated grade for the rope, unless otherwise defined by the purchaser's specification. The actual tensile strength of the wire is not to exceed 120 per cent of the specified minimum tensile strength.

Table 10.6.1 Recommended rope construction

Purpose	Construction of rope			Construction of strands
	Strands	Wires	Core	
Stream wires, towlines and mooring lines	6	24	Fibre	15 over 9 over fibre core
	6	37	Fibre	18 over 12 over 6 over 1
	6	26	Fibre	10 over (5 + 5) over 5 over 1
	6	31	Fibre	12 over (6 + 6) over 6 over 1
	6	36	Fibre	14 over (7 + 7) over 7 over 1
	6	41	Fibre	16 over (8 + 8) over 8 over 1
	6	30	Fibre	18 over 12 over fibre core
Towlines and mooring lines used in association with mooring winches	6	31	7 x 7 wire rope	12 over (6 + 6) over 6 over 1
	6	36	7 x 7 wire rope	14 over (7 + 7) over 7 over 1
	6	41	7 x 7 wire rope	16 over (8 + 8) over 8 over 1

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

6.3.3 For new rope construction, the manufacturer is to carry out prototype testing suitable for the application of the rope and this is to include tests on wire used for the construction.

6.3.4 Tensile and torsion tests, coating, and adhesion (wrap) tests are to be carried out on wire used for the manufacture of rope.

6.3.5 At least 10 per cent of the spools used for the manufacture of the strand are to be tested. The manufacturer is to demonstrate that tests have been carried out on at least one wire intended for each of the outer and inner strands, and for each diameter and grade used.

6.3.6 The heat number, wire diameter and strength of wire used for a particular construction are to be recorded by the manufacturer.

6.3.7 Torsion tests are to be carried out on the wire by causing one or both of the securing vices to be revolved until fracture occurs (a tensile load not exceeding two per cent of the breaking load of the wire may be applied to keep the wire stretched).

6.3.8 The uncoated wire is to withstand, without fracture, the number of complete twists given for Grades 1 or 3 in Table 10.6.2.

6.3.9 The galvanised wire is to withstand, without fracture, the number of complete twists given in the specification, as agreed with the purchaser and LR. In the absence of a suitable specification, the results are to comply with Table 10.6.2.

6.3.10 Hot dipped galvanised steel wire is to be used for the manufacture of ropes for marine applications. Depending upon the application, the coating may comply with any of the grades in Table 10.6.3. Grades 1 and 2 are heavy coatings. Grade 3 is the minimum coating weight where the galvanising is carried out prior to final wire drawing. Uncoated wire may be considered for approved applications.

6.3.11 The mass per unit area of the zinc coating is to be determined in accordance with a recognised National or International Standard.

6.3.12 Zinc coating tests are to be carried out for each designated grade of wire. The manufacturer is to demonstrate that the coatings are continuous and uniform and suitable for the intended purpose.

6.3.13 Unless otherwise specified by the purchaser, zinc coating tests are to be carried out on the wire prior to stranding.

6.3.14 The adhesion of the coating is to be tested by wrapping the wire round a cylindrical mandrel for 10 complete turns. The ratio between the diameter of the mandrel and that of the wire is to be as in Table 10.6.4. After wrapping on the appropriate mandrel, the zinc coating is to have neither flaked nor cracked to such an extent that any zinc can be removed by rubbing with a cloth.

Table 10.6.2 Torsion test

Diameter coated wire mm	Minimum number of twists					
	Grade 2		Grade 1 or 3			
	Minimum strength N/mm^2		Minimum strength N/mm^2			
	1570	1770	1420	1570	1770	1960
<1,3	19	18	29	26	23	23
≥1,3 <2,3	18	17	26	24	21	21
≥2,3 <3,0	16	14	24	22	—	19
≥3,0 <4,0	12	10	20	18	—	17
≥4,0 <4,6	—	—	18	16	—	—
≥4,6 <5,0	—	—	16	14	—	—
≥5,0 <6,0	—	—	14	11	—	—

NOTE
The minimum test length is 100*d* or 300 mm, where *d* is the wire diameter.

Table 10.6.3 Zinc coating

Diameter of coated wire mm	Zinc coating, minimum g/m^2		
	Grade1	Grade 2	Grade 3
≥0,20 <0,25	—	30	20
≥0,25 <0,33	—	45	30
≥0,33 <0,40	—	60	30
≥0,40 <0,50	60	75	40
≥0,50 <0,60	70	90	50
≥0,60 <0,80	85	110	60
≥0,80 <1,00	95	130	70
≥1,00 <1,20	110	150	80
≥1,20 <1,50	120	165	90
≥1,50 <1,90	130	180	100
≥1,90 <2,50	—	205	110
≥2,50 <3,20	—	230	125
≥3,20 <4,00	—	250	135

Table 10.6.4 Wrap test for adhesion of coating

Coating	Diameter of coated wire mm	Maximum ratio of mandrel to wire diameter
Grade 1 and 2	<1,5	4
	≥1,5	6
Grade 3	<1,5	2
	≥1,5	3

6.4 Tests on completed ropes

6.4.1 Every length of wire rope is to be subjected to a breaking strength test.

6.4.2 A sample of sufficient length is to be provided for the breaking load test. The rope ends are to be enclosed in a suitable socket. Testing is to be carried out in accordance with a recognised National or International Standard.

Document Released Under the Access to Information Act / Document divulgué en vertu de la Loi sur l'accès à l'information.

6.4.3 The rope may be subject to cyclic loading for bedding purposes prior to testing. The rope is to be tested at a suitable strain rate in accordance with a recognised National or International Standard.

6.4.4 The load is to be applied until one wire break is witnessed or 130 per cent of the minimum breaking load is recorded. The maximum recorded load is to be reported by the manufacturer.

6.4.5 Tests in which a breakage occurs adjacent to and as a result of damage from the grips are to be rejected, if the applied load is less than the specified minimum requirement. The rope is to be retested to withstand the agreed minimum breaking load.
